PREFACE

This volume represents the second to appear in the series of Tables of Data prepared by the present author. It presents in organized and conveniently usable form a summary of data on a selected list of organic compounds containing carbon and chlorine, or carbon, oxygen, and chlorine, or carbon, hydrogen, and chlorine, or carbon, hydrogen, and chlorine. Such compounds may more briefly be described as comprising Order 3.

Although users of its predecessor will immediately recognize many aspects of similarity in this book, they will also note in this volume certain differences. These distinctions are more fully discussed in Chapter I, but certain general aspects may be noted here.

Whereas the treatment of Order 1 compounds was directed mainly toward the aspect of identification, and though this point of view is vigorously continued, the present treatment of compounds of Order 3 has been expanded to include also the preparation, properties, and general chemical behavior of the individuals selected for treatment.

A second major difference from the earlier volume is in the extent of reference to the original literature or the corresponding abstracts thereof. This documentation is carried to a degree which may suggest to organic chemists that this volume comprises a Beilstein. The author hastens to disclaim any such degree of completeness for this work but does admit that for each compound selected a meticulous search of the literature through 1945 has furnished the basis for appropriate selection and systematic grouping of the aspects to be treated.

A third important difference from the earlier volume is the inclusion of references to patents as well as scientific articles. Though such patent references are treated with reserve, it is believed that they will be of interest to all users and of special value to industrial chemists. Throughout the book emphasis is given to industrial aspects since the rapid growth of this field during the last two decades, particularly in the United States, has resulted in the production and large-scale utilization of many individual compounds of this order (3).

A fourth type of difference in the present treatment as compared with that of Order 1 is seen in the tabulation of physical constants. In the earlier volume an attempt was made to select the "best" values. This process tended to conceal the magnitude and nature of the available constants from

PREFACE vi

which such selection was made and thus somewhat to weaken the degree of reliance to which the final selection was entitled. In the present volume all the relevant data on boiling points, melting points, densities, and refractive indices have been included, thus permitting the user to make such interpretation of their consonance (or lack of it) as his particular needs may require. With certain exceptions, the amount of such physical data is surprisingly small, and no attempt to assess its reliability has been made except that instances where little effort to obtain pure products was demonstrated have usually been disregarded.

A merely superficial inspection of this volume by a nonchemical user might give the erroneous impression that the text comprised only a compilation of reported data. Careful examination by organic chemists, however, will immediately disclose that its form of organization and mode of treatment are largely influenced by the nature of the chemistry involved. conspicuously shown by what might be called "negative entries." Definite knowledge that a particular reaction has not been reported or that an individual compound does not appear in the systematic literature is often of real value. Many entries of this type appear in the current record. connection the dependence of chemists upon adequate and complete indexes to their original and especially to their abstract journals deserves emphasis. The term "unreported" as used in this book signifies that the compound in question cannot be found by systematic use of the usual index sources. Undoubtedly, instances will arise in which a substance so characterized will be found to have been embedded in details of work with other principal objectives and thus to have escaped proper indexing in the abstract journals. The author will be grateful for information on any cases of this sort.

An extended exposition of the principles involved in the formulation of this volume will be found in Chapter I. Special attention, however, may be directed to the exceptional care taken to facilitate the use of this book. For example, the volume includes (as Chapter XXIII) five kinds of indexes. These comprise not only the conventional alphabetical name index but also indexes of compounds by empirical formulas, by chemical types, and even by percentage chlorine and molecular weights. Moreover, throughout the text of the individual compounds there are inserted extremely frequent references to the related compounds which are necessarily involved. If these other compounds are themselves given detailed treatment in either this book (Order 3) or its precursor (Order 1), they are indicated by appropriate serial numbers so that no reference to either index is necessary. If, however, such secondary compounds are not themselves treated in either book, reference to the corresponding volume and page of Beilstein's Handbuch der organischen Chemie is made instead.

A brief statistical survey of the content of this volume may be of interest.

vii PREFACE

The 1320 individual compounds of Order 3 to which detailed text treatment is given are distributed among 366 groups of isomers. Of these 1320 compounds 366, i.e., 26.7% of the group, have been prepared so recently that they do not appear in the Fourth Edition of Beilstein at all. A total of 164 cross-reference headings facilitate recognition of the melting points of high-boiling liquids, or the boiling points of compounds normally met with as solids.

The total number of literature references in this volume is more than 22,000, of which total 67% represent publications since 1919 (the last year for which both the main and first supplementary series of Beilstein's *Handbuch* are complete), and 47% represent publications since 1929. The number of references associated with a given compound naturally varies widely. The highest number of references (621) is given for chloroacetic acid, followed by 405 each for trichloroacetaldehyde and ethylene chlorohydrin. More than 50 references are associated with each of 68 numbered compounds.

The preparation of this volume has been a long and laborious operation. The author wishes to place on permanent record his deep appreciation of the conscientious, faithful, and accurate secretarial assistance given him over long periods by both Miss Shirley Ridgway and Miss Mildred Capodilupo and for a shorter period by Miss Ruth Volinn.

The author is keenly aware that he cannot hope to satisfy in full the particular interests of every user. There must necessarily exist differences of opinion on the relative importance of this or that compound, reaction, or derivative. However, if all possible objections were first to be overcome nothing would ever be accomplished, and the author hopes that any deficiencies of this volume may to some extent be compensated by its merits.

Furthermore, in a work of this kind and magnitude it is inevitable that, despite every good intention and every earnest and painstaking effort, actual errors of fact will still have escaped detection and correction. The author invites the friendly cooperation of all who discover any such flaws, meanwhile being consoled by the view expressed by the ancient Chinese writer Tai T'ung, who, some seven hundred years ago, issued his History of Chinese Writing with this statement: "Were I to await perfection my book would never be finished.... The book awaits a wise and lofty spirit to correct and suppress where the text is in error, to add where it is defective, and to supply new facts where it is altogether silent."

MEMORANDUM OF CERTAIN 1946-1947 REFERENCES NOT INCORPORATED IN REGULAR TEXT

The regular text of this book is made up of references selected from the chemical literature through the year 1945. Owing to the disturbed postwar conditions of the publishing and printing trades, and also to the exceptional difficulty and magnitude of this work, almost three years have elapsed since the termination of the period of writing of the organized text. Inevitably, there have appeared during this period many scientific papers whose content would gladly have been incorporated appropriately in the regular text. For practical reasons, however, such continuous adjustment was obviously impossible.

In an effort to avoid so far as possible complete loss of such material, however, certain of the more important papers which have come to the attention of the author during the 1946–1947 period have been listed in the following supplementary bibliography. Articles relevant to more than a single numbered compound are cited under the first in such a numerical series, cross-references being given under subsequent compounds to avoid excess duplication of references. In the interests of brevity, clarity, and consistency of nomenclature, slight modifications of the actual titles of the original papers have sometimes been made for purposes of this listing.

General

(1) Table of azeotropes and nonazeotropes

Horsley, Ind. Eng. Chem., Anal. Ed. 19, 508-600 (1947)

This extraordinary 92-page compilation with its accompanying formula index and bibliography of 172 references is so generally valuable and includes so many of the serially numbered compounds of this book that it is placed at the head of this supplementary reference list without further cross-reference to it from subsequent entries below.

3:0075 δ-Chloro-n-valeric acid

(2) Isomeric chlorinated long-chain esters

Guest, J. Am. Chem. Soc. 69, 300-302 (1947)

—Methyl δ -chloro-n-valerate: b.p. 89–92° at 18 mm. [From δ -chloro-n-valeronitrile 80% H_2SO_4 refluxed 50 hr.]

3:0235 α-Chloroisobutyric acid

(3) The chloro- and bromoisobutyronitriles

Stevens. J. Am. Chem. Soc. 70, 166 (1948)

 \bigcirc α -Chloroisobutyramide: cryst. from EtOAc, m.p. 115–118°; from aq., m.p. 117–119°. [From α -chloroisobutyryl chloride (3:5385) with conc. NH₄OH at 10° in 70% yield.]

3:0280 Chloromaleic anhydride

(4) Use of C in determination of conjugated diolefins

Putnam, Moss, Hall, Ind. Eng. Chem., Anal. Ed. 18, 628-630 (1946)

3:0460 8-Chloropropionic acid

(5) Convenient synthesis of β -chloropropionitrile (from acrylonitrile with hydrogen chloride) Stewart, Clark, J. Am. Chem. Soc. 69, 713-714 (1947)

3:0885 α-Chloro-diphenylacetyl chloride

C as reagent for preparation of benzilic acid esters of tertiary amino alcohols (6) King, Holmes, J. Chem. Soc. 1947, 164-168; C.A. 41, 5121 (1947)

3:1150 Trichloroacetic acid

(7) Kinetics of the decomposition of certain salts of \overline{C} in ethanol-water mixtures Hall, Verhoek, J. Am. Chem. Soc. 69, 613-616 (1947)

(8) Kinetics of the decomposition of $\overline{\mathbf{C}}$ in formamide-water mixtures Cochran, Verhoek, J. Am. Chem. Soc. 69, 2987-2988 (1947)

3:1212 Phenacyl chloride

(9) The reaction of C with phenylhydrazine van Alphen, Rec. trav. chim. 65, 112-116 (1946); C.A. 41, 409 (1947)

3:1370 Chloroacetic acid

(10) New method for the detection and determination of C (using pyridine) Ramsey, Patterson, J. Assoc. Offic. Agr. Chemists 29, 100-111 (1946); C.A. 40, 3369

(11) Effect of pH on rate of hydrolysis of C Berhenke, Britton, Ind. Eng. Chem. 38, 544-546 (1946)

3:1420 1,1,1-Trichloro-2,2-diphenylethane

(12) Derivatives of C

Haskelberg, Lavie, J. Am. Chem. Soc. 69, 2267-2268 (1947)

(13) Symmetrical analogues of DDT Stephenson, Waters, J. Chem. Soc. 1946, 339-343; C.A. 40, 5040 (1946)

3:3298 1,1,1-Trichloro-2,2-bis-(p-chlorophenyl)ethane ("DDT")

(14) Methods of preparation of C

Bailes, J. Chem. Education 22, 122 (1945); C.A. 41, 3085 (1947)

(15) Preparation of technical C

Mosher, Cannon, Conroy, Van Strien, Spalding, Ind. Eng. Chem. 38, 916-923 (1946) (16) Preparation of C using HF as condensing agent Simons, Bacon, Bradley, Cassaday, Heegberg, Tarrant, J. Am. Chem. Soc. 68, 1613-

1615 (1946) (17) Production of C

Castonguay, Ferm, Trans. Kansas Acad. Sci. 49, 167-174 (1946); C.A. 41, 2409 (1947)

(18) Synthesis of C with chlorosulfonic acid as condensing agent W. A. Cook, K. H. Cook, W. H. C. Rueggeberg, Ind. Eng. Chem. 39, 868-870, 1683 (1947)

(19) A colorimetric method for microdetermination of C (xanthydrol/KOH/pyridine method) Stiff, Castillo, Science 101, 440-443 (1945); C.A. 39, 2830 (1945)

Determination of C in organs and body fluids after oral administration (xanthydrol/-(20) KOH/pyridine method) Stiff, Castillo, J. Biol. Chem. 159, 545-548 (1945); C.A. 39, 4695 (1945)

(21) Application of xanthydrol/KOH/pyridine method to the determination of C in water Castillo, Stiff, Military Surgeon 97, 500-502 (1945); C.A. 40, 2561 (1946)

(22) Field test for surface C

Stiff, Castillo, Ind. Eng. Chem., Anal. Ed. 18, 316-317 (1946)

(23) Chemical methods for analysis of C

Ginsberg, J. Econ. Entomol. 39, 174-177 (1946); C.A. 40, 4842 (1946)

(24) Colorimetric determination of p,p'-isomer in technical C Charkin, Ind. Eng. Chem., Anal. Ed. 18, 272-273 (1946)

(25) Determination of p,p'-isomer in technical C

Cristol, Hayes, Haller, Ind. Eng. Chem., Anal. Ed. 18, 339 (1946)

(26) Determination of p,p'-isomer in technical C

Balaban, Calvert, Ind. Eng. Chem., Anal. Ed. 18, 339 (1946)

(27) Determination of p,p'-isomer in technical \bar{C} by a microscopical method McCrone, Smedal, Gilpin, Ind. Eng. Chem., Anal. Ed. 18, 578-582 (1946)

(28) Determination of C in dusts and oil solutions La Clair, Ind. Eng. Chem., Anal. Ed. 18, 763-766 (1946) (29) Determination of C as spray residue on fresh fruit by three independent methods Wichmann, Patterson, Clifford, Klein, Claborn, J. Assoc. Offic. Agr. Chemists 29, 188-190 (1946); C.A. 40, 6705 (1946)

Method 1. Organic chlorine determinations

Klein, Wichmann, ibid. 29, 191-195 (1946); C.A. 40, 6705 (1946)

Method 2. The Shechter-Haller colorimetric procedure Clifford, *ibid.* 29, 195-206 (1946); C.A. 40, 6705 (1946)

Method 3. 2,4-Dinitrophenylhydrazine method

Claborn, Patterson, ibid. 29, 206-218 (1946); C.A. 40, 6705 (1946)

(30) Decomposition and volatility of \(\bar{C}\) and some of its derivatives Wichmann, Patterson, Clifford, Klein, Claborn, J. Assoc. Offic. Agr. Chemists 29, 218-233 (1946); C.A. 40, 6740 (1946)

(31) Colorimetric determination of \(\bar{C}\) in milk and fatty materials Shechter, Pogorelskin, Haller, Ind. Eng. Chem., Anal. Ed. 19, 51-53 (1947)

(32) Estimation of \bar{C} in milk by determination of organic chlorine Carter, Ind. Eng. Chem., Anal. Ed. 19, 54 (1947)

(33) Determination of C by Shechter procedure, particularly in milk and fats Clifford, J. Assoc. Offic. Agr. Chemists 30, 337-349 (1947); C.A. 41, 6839 (1947)

(34) Nature of the by-products in technical C
Gätzi, Stammbach, Helv. Chim. Acta. 29, 563-572 (1946); Experientia 1, 276 (1945);
C.A. 40, 5040-5041 (1946)

(35) Simple purification procedure for C K. H. Cook, W. A. Cook, J. Am. Chem. Soc. 68, 1663-1664 (1946)

(36) Applications of infrared spectroscopy to C

Downing, Freed, Walker, Patterson, Ind. Eng. Chem., Anal. Ed. 18, 461-467 (1946) (37) Some derivatives of \overline{C}

Backeberg, Marais, J. Chem. Soc. 1945, 803-805; C.A. 40, 1156, 5717 (1946) (38) Bromine analogs of C

Cristol, Haller, J. Am. Chem. Soc. 68, 140-141 (1946)

(39) Crystal structure of C and relatives Wild, Brandenberger, Helv. Chim. Acta 29, 1024-1040 (1946); C.A. 41, 428 (1947)

(40) Synthesis of some analogs of C Kirkwood, Dacey, Can. J. Research 24-B, 69-72 (1946); C.A. 49, 5717 (1946)

(41) Catalytic decomposition of C Flenner, J. Am. Chem. Soc. 68, 2399 (1946)

(42) Inhibition of catalyzed thermal decomposition of C Gunther, Tow, J. Soc. Chem. Ind. 66, 57-59 (1947); C.A. 41, 5675 (1947)

(43) Dehydrohalogenation of C

Wain, Martin, Nature 159, 68-69 (1947); C.A. 41, 2715 (1947)

(44) Estimation of \overline{C} by methods depending upon dehydrohalogenation Wain, Martin, Analyst 72, 1-6 (1947); C.A. 41, 2198 (1947)

(45) Preparation of di-(p-chlorophenyl)acetic acid from C Grummitt. Buck. Egan. Org. Syntheses 26, 21-23 (1946)

(46) Reactions of C and associated compounds

Forrest, Stephenson, Waters, J. Chem. Soc. 1946, 333-339; C.A. 49, 5038-5040 (1946)

(47) Crystallization of C from binary melts Gilpin, McCrone, Smedal, Grant, J. Am. Chem. Soc. 70, 208-211 (1947)

3:3320 1.1-Dichloro-2.2-bis-(p-chlorophenyl)ethane ("DDD")

(48) Anhydrous FeCl₃ as rearrangement catalyst for some chlorinated diphenylethanes Fleck, J. Org. Chem. 12, 708-712 (1947)

8:3380 4,6-Dichlororesorcinol

(49) For preparation of isomeric 2,4-dichlororesorcinol see Pectynin, Kuchina, J. Gen. Chem. (U.S.S.R.) 17, 278-282 (1947); C.A. 42, 534-535 (1948)

3:3934 p-Phenylphenacyl chloride

(50) Conversion of C to p-phenylphenacyl iodide Rheinboldt, Perrier, J. Am. Chem. Soc. 69, 3148-3149 (1947)

3:4695 2,4-Dichlorophenoxyacetic acid

(51) Preparation of C from phenol and chloroacetic acid Ebel, Bell, Fries, Kasey, Berkebile, J. Chem. Education 24, 449 (1947)

- (52) Determination of C and its compounds in commercial herbicides Rooney, Ind. Eng. Chem., Anal. Ed. 19, 475-476 (1947)
- (53) The halogenation of aryloxyacetic acids and their homologs Haskelberg, J. Org. Chem. 12, 426-433 (1947)

(54) Preparation of 2,4-dichlorophenoxyacetyl chloride Freed, J. Am. Chem. Soc. 68, 2112 (1946)

3:4375 p-Chlorophenoxyacetic acid

(-) See reference (53) under 3:4095 (above).

3:4410 cis-1,2,3,4,5,6-Hexachlorocyclohexane

(55) Preparation of the benzene hexachlorides

Gunther, Chemistry & Industry 1946, 399; C.A. 41, 1625 (1947)

(56) Infrared spectroscopic analysis of five isomers of C Dassch, Ind. Eng. Chem., Anal. Ed. 19, 779-785 (1947)

(57) Kinetics of the alkaline dehydrochlorination of the benzene hexachloride isomers Cristol, J. Am. Chem. Soc. 69, 338-342 (1947)

(58) Alkaline degradation of benzene hexachlorides Gunther, Blinn, J. Am. Chem. Soc. 69, 1215-1216 (1947)

(59) The gamma isomer of hexachlorocyclohexane

Slade, Chemistry & Industry 1945, 314-319; C.A. 40, 2257-2259 (1946)

(60) The epsilon isomer of hexachlorocyclohexane

Kauer, DuVall, Alquist, Ind. Eng. Chem. 39, 1334-1338 (1947)

(61) Determination of hexachlorocyclohexane is impregnated cloth Goldenson, Sass, Ind. Eng. Chem., Anal. Ed. 19, 320-322 (1947)

3:4612 Di-(p-chlorophenyl)acetic acid

(--) Preparation from "DDT"; see reference (45) under 3:3298 (above)

3:4835 Hexachloroethane

(62) Preparation of C by chlorination of liquid 1,1,2,2-tetrachloroethane and pentachloroethane Pearce, Can. J. Research 24-F, 369-379 (1946); C.A. 40, 7151 (1940)

3:4947 Tetrachlorophthalic anhydride

(63) Reactions and uses of C

Lawlor, Ind. Eng. Chem. 39, 1419-1423 (1947)

(64) Tetrachlorophthalic anhydride, acid and salts Lawlor, Ind. Eng. Chem. 39, 1424-1426 (1947)

(65) The esterification of C Nordlander, Cass, J. Am. Chem. Soc. 69, 2679-2682 (1947)

3:4990 trans-1,2,3,4,5,6-Hexachlorocyclohexane

(-) See references (55)-(61), inclusive, under cis-isomer (3:4410) (above)

3:5000 Carbonyl chloride (Phosgene)

(66) Heat capacity, entropy, vapor pressure, and heats of fusion and vaporization of C Giaque, Jones, J. Am. Chem. Soc. 70, 120-124 (1948)

(67) Preparation of benzoic acid from C with benzene Rueggeberg, Frantz, Ginsburg, Ind. Eng. Chem. 38, 624-626 (1946)

(68) Reaction of C with tertiary amines under conditions for formation of tetrasubstituted ureas

Lastovskii, J. Applied Chem. (U.S.S.R.) 19, 440-444 (1946); C.A. 41, 1214 (1947)

(69) Reaction of C with o-aminobenzoic acid (to give 72-75% yield isatoic anhydride) Wagner, Fegley, Org. Syntheses 27, 45-47 (1947)

3:5028 trans-1,2-Dichloroethylene

(70) Condensation of alkyl chlorides with polychloro-olefins Schmerling, J. Am. Chem. Soc. 68, 1655-1657 (1946)

(71) Reaction of C with isobutane Schmerling, J. Am. Chem. Soc. 70, 379-381 (1948)

3:5042 cis-1,2-Dichloroethylene

(-) See references (70) and (71) under trans-isomer (3:5028) (above)

3:5050 Chloroform

(72) The addition of polyhalomethanes to olefins

Kharasch, Jensen, Urry, J. Am. Chem. Soc. 69, 1100-1105 (1947)

(73) Compound formation of C with pyridine Davidson, Van der Werf, Boatright, J. Am. Chem. Soc. 69, 3045-3047 (1947)

3:5100 Carbon tetrachloride

- See references (72) and (73) under chloroform (3:5050) (above)
- (74) Analysis of the system benzene/ethanol/carbon tetrachloride (by refractive indices and densities) Campbell, Miller, Can. J. Research 25-B, No. 3, 228-242 (1947); C.A. 41, 6839 (1947)

3:5110 1,2-Dichloropropene-1 (low-boiling stereoisomer)

(-) See reference (70) under 3:5028 (above)

3:5130 1.2-Dichloroethane

(75) Reaction of C with benzene

Korshak, Kolesnikov, Kharchevnikova, Compt. rend. acad. sci. U.R.S.S. 56, 169-172 (1947); C.A. 42, 545 (1948)

3:5150 1,2-Dichloropropene-1 (high-boiling stereoisomer)

(—) See reference (70) under 3:5028 (above)

3:5170 1,1,2-Trichloroethylene

See reference (70) under 3:5028 (above) (---)

(76)Dimerization of C

Henne, Ruh, J. Am. Chem. Soc. 69, 279-281 (1947)

3:5190 2.3-Dichloropropene-1

(—) See reference (70) under 3:5028 (above)

3:5210 Trichloroacetaldehyde

(77) Determination of C in technical chloral

Harrington, Boyd, Cherry, Analyst 71, 97-107 (1946); C.A. 40, 3368 (1946)

(78)Determination of small amounts of water in C

	D. Index of compounds by chemical types	
	E. Alphabetical name index	19

1. The scope of this book

Systematic classification of organic compounds may be effected in many different ways, each having certain advantages and disadvantages. Although the scope of this present book, by including the aspects of preparation, physical properties, and general chemical behavior as well as identification, is very much broader than that of its precursor, yet the advantages inherent in the general form of classification there employed have led to its extension to the present book.

According to this arrangement, all organic chemical compounds are first classified by orders. The order of a compound is established by its qualitative elementary composition; compounds containing the same elements belong to the same order. Thus, Order 1 is defined as comprising compounds of carbon with hydrogen, or of carbon with both hydrogen and oxygen; this order was treated in the above-mentioned volume. When other elements

¹Identification of Organic Compounds; Tables of Data on Selected Compounds of Order 1, by Ernest Hamlin Huntress and Samuel Parsons Mulliken, John Wiley & Sons, New York, xvii + 691 pages, 1941.

are also present, a compound is said to belong to a higher order: e.g., compounds of carbon with both hydrogen and nitrogen, with oxygen and nitrogen, or with hydrogen, oxygen, and nitrogen comprise Order 2. A systematic arrangement of still higher orders has been developed but need not be fully amplified here.

The substance of the present volume is concerned primarily with compounds of Order 3, i.e., with compounds containing carbon and chlorine; carbon, oxygen, and chlorine; carbon, hydrogen, and chlorine; carbon, hydrogen, and chlorine. To all such compounds deemed of sufficiently general interest to warrant detailed treatment in this book, serial numbers have been assigned as later explained. Although such serial numbers are thus restricted to species of Order 3, a vast number of compounds belonging to other orders inevitably occurs in the course of the individual texts so that this volume has far wider utility than might at first glance be supposed. At the same time not all substances belonging to Order 3 are given numbers since many are not of sufficient value to warrant such extensive treatment.

2. The matter of suborders

In the general plan of ordinal classification, it is sometimes (but not always) useful to effect subdivision of orders into two suborders according to whether or not the pure compounds are colored. For both Orders 1 and 2, such subordering has special merit. For the present Order 3 compounds, however, the proportion of colored individuals is almost negligible, and employment of suborders has been avoided.

3. The arrangement of compounds of Order 3 into divisons

Just as the individual compounds of Order 1 were ultimately further subclassified into various *genera*, each characterized by a common behavior in certain prescribed and carefully defined *generic tests*, so it would of course be perfectly possible to set up an analogous series of genera for any or all of the higher orders. After considerable reflection and experimentation, however, such extension of the method of generic subclassification has seemed an extravagant formality whose added value for the higher orders does not warrant its establishment. Consequently, the individuals comprising the present Order 3 are not arranged by genera, and there are no standardized generic tests to be systematically applied.

Instead of arrangement by genera, therefore, the compounds assigned serial numbers in this book are arranged in three divisions. The first of these divisions comprises members of Order 3 which, when pure, are normally solids with at least reasonably definite melting points. The second comprises members of Order 3 which, when pure, are liquids with boiling points attainable and recorded at ordinary pressure. The third division comprises

members of Order 3 which, even when pure, are liquids which either cannot be distilled at atmospheric pressure without serious decomposition or for which such data are available only under reduced pressure. Ample cross-references connecting the solid and liquid divisions facilitate recognition of appropriate cases.

4. The sequence of compounds within the three divisions

DIVISION A. The individual solids constituting Division A are arranged in the order of increasing magnitude of their respective melting points. For compounds on which there is poor agreement regarding the true melting point, the value determining the position of the compound relative to its neighbors is not necessarily the highest listed. Values printed within square brackets have been regarded by the author on the collateral evidence as possibly doubtful, and such constants have been discounted in assigning positional sequence to the compound.

Division B. This division, comprising liquids of Order 3 with boiling points at ordinary pressure, is (unlike either its predecessor or successor) further subdivided into two sections according to the specific gravity at 20° C. referred to water at 4° C. Section 1 contains such liquids with values of D_4^{20} greater than 1.15; Section 2 contains correspondingly those liquids for which the value of D_4^{20} is less than 1.15. Within each of the sections of Division B the individual species are arranged in the order of increasing magnitude of their respective boiling points, preferably at 760 mm. pressure. For compounds whose boiling points at this standard pressure are unreported, no attempt has been made to calculate over since to do so seems likely to introduce serious uncertainties.

Division C. This division contains all serially numbered compounds of Order 3 which have not been allocated to either of the preceding divisions, such cases usually comprising liquids for which boiling points are reported only at reduced pressures. Within this division an entirely different method of establishing the listing sequence is employed; viz., the compounds are listed in ascending sequence according to the composition of their empirical formulas. For any given number of carbon atoms, compounds containing carbon and chlorine, or carbon, oxygen, and chlorine, or carbon, hydrogen, and chlorine fall in that sequence. Within any one of these four subgroups the sequence is determined by increasing magnitude of the number of component atoms in the sequence (as above) of carbon, hydrogen, oxygen, and chlorine. Although expressed in words this sounds formidable, even casual inspection of the Tables or of the Empirical Formula Index quickly supplies convincing evidence of its complete simplicity in actual practice.

5. The arrangement of data on individual compounds

Whether the amount of data for the compounds comprising this volume is large or small, and irrespective of numerous variations of details, a certain standard form may be recognized as common to all. This form may be construed as made up of the following five elements:

- A. The heading.
- B. Fundamental physical constants.
- C. General data on other constants, preparation and properties.
- D. Designation of special or preliminary tests.
- E. Derivatives.
- F. References to the original literature.

The relative amount of space devoted to these five aspects varies according to circumstances. Each is discussed below in much further detail.

A. The heading

The heading of each numbered compound comprises (in its most general form) five components which always occur in the following sequence from left to right, viz.,

- 1. Location number 2. Name 3. Structural 4. Empirical 5. Beilstein of compound in (or formula formula reference this book (Order 3) names)
- (1) The location number. Each compound on which detailed treatment is given in this book has been assigned an arbitrary number to facilitate frequent cross reference in indexes and other parts of the text. This number consists of a digit representing the order of the compound (thus all species of this volume have location numbers beginning with 3), followed by a colon and then a four-digit arbitrary number. The system is, therefore, entirely comparable to a telephone number, the initial digit preceding the colon corresponding to an exchange, the four following digits corresponding to an individual line.

In assigning serial location numbers to the various individuals treated in this book, a principle has been maintained whose recognition greatly facilitates recognition of the physical nature of the corresponding substances. All members of Division 1 (solids) carry numbers between 1 and 4999; all members of Division 2, Section 1, are between 5000 and 6999; all members of Division 2, Section 2, are between 7000 and 8999; all members of Division 3 are between 9000 and 9999.

For a given compound, the full descriptive data are recorded only in one place, i.e., in that corresponding to the location number. When occasion

arises to be reminded in some other portion of the book of certain properties of a given compound, the *heading only* is repeated followed by a cross reference to the place of detailed description, the section usually occupied by the location number being indicated merely by a dash. The most frequent occasion for this type of cross reference is to indicate the boiling point of a compound normally met with as a solid, or alternatively the melting point of a substance normally met as a liquid.

(2) The name (or names) of the compound. The second element of the heading is devoted to the name (or names) of the compound. Out of all possible names, one (regarded for the purposes of this book as the "principal name") has been printed in bold-face capitals.

In many instances, however, this principal name is followed in ordinary type by one or more other names which are in common use and which might occur alternatively to users of this volume. All these names are appropriately entered in the alphabetical name index so that the location number is readily obtained irrespective of which name may be sought by the user.

(3) The structural formula of the compound. Since it is frequently easier to interpret the chemical reactions of a compound by contemplation of its structural formula rather than its name, such structural pictures are given for all compounds in this volume.

If a particular compound reacts as if it had two different structures, both are pictured.

Although such structural formulations are construed as the third element of the heading of each compound, it may happen that, owing to practical space considerations, the picture is not actually printed as part of the top line but depressed somewhat below it.

- (4) The empirical formula. The fourth element of the heading is the empirical formula. This will be found useful in many ways, particularly in suggesting (especially with the amplification afforded by the empirical formula index) isomeric compounds from which distinction must be made, and in searching the abstract periodicals for data reported after the publication of this volume.
- (5) The Beilstein reference. Each compound listed in these Tables carries in the upper right-hand corner as the fifth element of the heading reference to Beilstein's Handbuch der organischen Chemie. All such references designate the fourth edition of this important tool.

At the time of preparation of these Tables, all twenty-seven volumes of the primary series (covering the literature up to 1910) together with the corresponding twenty-seven volumes of the first supplementary series (1910–1919, inclusive) of Beilstein's Handbuch were available. For every numbered compound of these Tables which appears in either the main or first supple-

mentary series, the Beilstein reference will comprise two parts, the first giving the volume and page in the main series, the second giving corresponding reference to the first supplementary series. To distinguish the latter, the volume reference carries the subscript 1, and the page reference is placed between parentheses to indicate that the regular pagination of such supplementary volume is designated.

In addition to the main and first supplementary series of Beilstein mentioned above, there were also available during the preparation of these *Tables* the first five volumes of the second supplementary series (1920–1929) of Beilstein's *Handbuch*. For such of the present numbered compounds as were treated in this available fragment, the Beilstein reference will, therefore, contain a third element representing the volume and page involved. For this kind of case the volume reference bears the subscript 2 (to indicate second supplementary series) together with the page reference in parentheses as before.

In accordance with the above explanation, a given compound will have either two or three Beilstein references. It is, of course, possible for a compound to have citation to only one or two out of the three maximum possibilities; absence of any data for a particular Beilstein unit is indicated by short dashes after the volume number.

The remaining possible case is that in which the compound in question is of such recent origin that Beilstein contains no reference to it either in the main section or either supplementary series. Many such compounds occur in this Order 3. Under these circumstances the usual Beilstein citation is replaced by the Beilstein System Number of the compound, e.g., Beil. S.N. 644. Such type of reference immediately indicates that no reference to the substance is contained in any Beilstein issues through Vol. V of the second supplementary series. Whenever third, fourth, or later supplementary series become available, however, this system number will indicate the position of the compound within narrow limits, even though volume and page cannot now be predicted.

The practice of giving all three Beilstein citations wherever possible serves as a continual reminder that to look merely in the main series volume of Beilstein yields material only up to 1910; for the next two decades the corresponding first and second supplements must also be examined. In this respect these *Tables of Order 3* extend the practice of those of Order 1, where only the main series citation was made, extension to the first supplement being left to the user.

That these references to Beilstein's *Handbuch* are here included only as an additional convenience to users of these *Tables* should be clearly understood. This book is wholly independent of Beilstein, and those users to whom Beilstein may be inaccessible are reassured that the value of these *Tables* to them is in no way impaired.

B. Fundamental physical constants

The five components of the standard heading having been discussed, some comment upon the next element of each description is required. element comprises what are here designated as "fundamental physical constants" and which in the most general cases consist of data on (1) the melting point, (2) boiling point, (3) density, and (4) refractive index. In the sequence named, these are arranged in four vertical columns from left to right of a given page. For substances which are solids under ordinary conditions, the melting-point column is the first at the left of the page with the boiling-point column next following in the left central section. For such solids only rarely will density or refractive index data appear. For liquids, however, the first left-hand column is devoted to boiling-point data, the melting points being displaced to the next right-hand column because of their subordinate value in such instances.

(1) The melting point. Whereas in the earlier Tables of Order 1 the general practice was to express only a single figure for this constant, the individual descriptions of this book include substantially all values that have been reported. However, values which in the light of collective subsequent results are certainly too low, or those which because of their wide range make no claim to accuracy, are omitted. The survey of values thus set forth, together with the fact that the source of each value is also given, permits the user to form his own opinion concerning the magnitude, degree of concordance. and precision of the available data.

For each individual compound the several values are arranged in the order of diminishing numerical magnitude. In general the value of highest magnitude is employed to determine the place of the individual solid relative to its fellows (i.e., to determine its serial location number). However, values enclosed by square brackets are regarded by the author on collateral evidence as being abnormally high, and such constants are ignored in establishing the serial number of the individual.

The several melting points are recorded here just as they are reported in the original literature; whenever the designations corrected or uncorrected were included in the original source, they are repeated here; most of the values. however, fail to specify whether they are corrected or not. This careless usage of much journal literature is to be deplored.

No attempt has been made in this book generally to maintain a distinction between melting point and freezing point. Undoubtedly, most of the values reported represent conventional capillary-tube melting points; frequently. however, the values are expressed to a degree of precision suggesting that a cooling-curve method was employed. Whenever the distinction is of importance, the user can readily ascertain full details from the cited references.

(2) The boiling point. In complete analogy with its treatment of melting points, the individual descriptions of this book include substantially all recorded values of the boiling point. These are tabulated in the order of diminishing numerical magnitude of the prevailing pressures. Wherever the data can be found, the value at 760 mm. pressure is cited; however, if this is not directly reported, no attempt has been made to convert the available figures over to that pressure, as to do so would introduce unwarranted assumptions. Values of the boiling point at various pressures are meticulously included in the Tables. However, when a careful physicochemical study has been made of the vapor pressure of an individual, selected values are printed and reference made to the original for further detail.

Even a casual examination of the boiling point data reported in this book leads at once to the conviction that there has been a great variation in the precision of measurement of the prevailing pressure over the boiling liquid. In fact an incredible proportion of workers has not reported any pressure figures at all or complacently referred to the "prevailing atmospheric pressure." Even when pressure measurements are reported, the evident general lack of concordance becomes distressing evidence of the inadequacy and inaccuracy of many of the data in the literature.

(3) Densities. Unlike the extensive treatment accorded for melting points and boiling points, this book does not attempt to tabulate all possible published values for the densities of liquid compounds. However, all available data for density at 20°C. referred to water at 4°C. are given; and, whenever possible, the same procedure is extended to values for D_4^{25} and D_4^{15} . Note that, when values are given for various temperatures, those for the highest temperature are printed at the top of the density column, followed in diminishing magnitude of temperature by the other values. This simple and obvious device is intended to assist users of these Tables, but they should be reminded that this plan was not (unfortunately) employed with the Tables of Order 1.

Density data are given for all liquids for which they can be found; for compounds normally solid, the density is occasionally given for some temperature above the melting point, especially if refractive index values at the same temperature are also available.

Whenever in an original paper there exists any uncertainty as to the temperature of the water with which comparison is made, the lower subscript is replaced by a short dash to indicate that the omission of this figure is not accidental but is because of inadequate expression in the original. In many or even most such cases it is possible that the author intended to convey that the density was expressed with respect to water at the same temperature. This author, however, declines to make any such assumption and ventures to express the view that research workers and journal editors should insist upon unambiguous expression of such data.

(4) Refractive indices. These are usually given in the form $n_{\rm D}^{20}$, i.e., the refractive index determined at 20°C. with the D line of sodium light. In some instances data for other lines of the spectrum have been reported here when no data on the D line were available. As with the densities above, refractive index data are frequently printed for other temperatures, and the same typographical convention of placing the higher-temperature values above the lower-temperature ones is continued.

C. General data on other constants, preparation, and properties

The preceding details of the five components of the heading and the four so-called fundamental constants having been discussed, it is now desirable to comment upon the third element of the text of each compound. material comprising this third section actually comprises most of the space of this book. Although sometimes consisting of only a few paragraphs, there are many members of Order 3 for which the general exposition of behavior requires many pages. Such extended treatments are frequently (although not invariably) subdivided by major and minor headings intended to facilitate quick recognition of the probable location of particular types of desired information. Careful examination of the text of any typical individual compound will quickly disclose that it has in general been dealt with in At the same time it is obvious that a line must be drawn generous fashion. somewhere. For example, in connection with the discussion of an alkyl halide such as n-butyl chloride, it is certainly of highest relevance to indicate the mode and extent of its ability to form n-butyl magnesium chloride. Furthermore, the value of the simpler reactions of the RMgCl compounds. particularly with reference to their utility in the identification of the initial halide itself, is evident, but on the other hand no attempt has been made to cover all the known reactions of butyl magnesium chloride since that would involve an undertaking of disproportionate magnitude.

Although details of the texts of individual compounds naturally differ in nature and magnitude and are influenced by the literature content corresponding to the direction of published research, certain aspects occur with sufficient frequency to warrant comment.

The text of each compound invariably comprises its methods of preparation and its chemical behavior. For many of the more common or especially important species, these two aspects are often preceded by an introductory section containing certain physical data (in addition to that of the heading) likely to be of particular interest or utility to organic chemists. Examples of such entries include binary and ternary systems with other compounds, especially with reference to freezing-point composition data, azeotropes, densities and/or refractive indices, etc. In this introductory section also attention is frequently directed to methods of quantitative determination

of the compound, examples of industrial or other utilization, biochemical behavior especially with regard to studies on toxicity, antiseptic character, etc. The selection of entries for this introductory section is admittedly arbitrary, and users are reminded that this book makes no claim to include all known data even on the compounds to which serial numbers are assigned. Indeed, in an effort to keep the volume within reasonable bounds, certain types of data of value to organic chemists have been deliberately (though regretfully) excluded, such as references to absorption or Raman spectra, dipole moments, and viscosities, although many instances of the four fundamental physical constants of the heading are drawn from original publications primarily concerned with these aspects.

Within the text of each individual numbered compound (immediately following the above-mentioned introductory section, if any), there occurs a section on its methods of preparation. This treatment has purposely been made as complete as possible. To a limited degree distinction has been made between preparation and formation; but, because even in contemporary publications many authors fail to report yields, adequate recognition of the appropriate category is not always possible. Original results reported only in terms of weight have been calculated over to percentage yields. Variations in yields by a single method of preparation are contrasted by massing them in the text, the uniform practice of following each statement with its corresponding citation serving conveniently to associate each yield with a particular modification. With compounds for which there are many modes of preparation, the most generally practicable methods are often singled out for particular mention at the beginning of the preparative section, followed by a systematic presentation of all the recorded methods under various subheadings appropriate to the circumstances.

Users of this book will find these sections on preparation not only extremely useful from the viewpoint of comparison of various alternatives but also very stimulating and suggestive in the formulation of unconventional approaches to their particular problems.

Within the text of each numbered compound of this book, following the introductory section (if any) and the preparative section, is next set forth the significant aspects of its chemical behavior. The length of this part of the treatment varies widely from a few phrases to many pages. Very long treatments are appropriately subdivided for practical convenience, the particular sequence of arrangement being dictated by various circumstances. For example, the earlier subdivisions often deal with pyrolysis, reduction, oxidation, and substitution reactions, followed by the behavior with inorganic and organic reactants. With bifunctional compounds the initial group is frequently followed by the behavior of each function with inorganic and organic reactants in that order. Users will experience no difficulty in recognizing

the systematic organization of each compound. Emphasis has been placed upon a systematic and logical presentation of each case, and the above general outline has served the construction of this book only as a general guide rather than a rigid frame.

Two matters continually arising within the descriptive text deserve a further word of comment. The first relates to the fact that, in the course of reporting the chemical behavior of each numbered compound, there is necessarily involved reference to many other substances. Such of these as appear in either this volume (Order 3) or its predecessor (Order 1) are immediately followed by their serial numbers. A great many other compounds belonging to orders not yet written up in this series are inevitably involved; for such compounds reference to Beilstein is usually made for the convenience of the user who may have occasion to follow the matter further.

The second matter involves the practice of this book with respect to citations. Many instances appear which at first glance might appear to involve unnecessary repetition of the citation number, but which really comprise signals to the reader. As a simple illustration, consider the following extract from the text of p-chlorophenol, referring to the method of preparation of its N-(m-nitrophenyl)carbamate, viz.: "From $\bar{\mathbb{C}}$ with m-nitrophenzazide (283) or m-nitrophenyl isocyanate (283) in lgr. (283)." This usage designates the fact that the preparation of both the m-nitrophenyl isocyanate is given in reference (283) together with their utilization as reagents in the conversion of p-chlorophenol to the corresponding N-(m-nitrophenyl)carbamate. Of course, with commonly available reagents such extra citations need not be included.

In view of the nature and magnitude of the text of this book, there may be a tendency to regard it as a specialized Beilstein within its field. Such a characterization would carry the implication that the text comprises all known chemical information with respect to each component compound, whereas only the more important representatives of such data are offered. In this connection one common misunderstanding with respect to Beilstein's Handbuch has significance. The Beilstein classification employs the principle of "latest position in the system." This means that, when a given fact could logically be placed in several different places, it is in general associated with the last of such places in the systematic plan. For example, as the methyl ether of phenol, anisole could conceivably be discussed either under methyl alcohol or under phenol. Following the above principle, however, Beilstein discusses it under phenol with no mention whatever under methyl alcohol. For Beilstein's purpose this principle is extremely well founded. results in an orderly, systematic, and uniform procedure, and, if properly understood, causes no trouble to the user. Its employment does have the unfortunate result, however, that for compounds occurring early in the

systematic sequence the impression is often given to the uninitiated that nothing is known about reactions involving components themselves listed later in the classification scheme. In contrast to the above Beilstein usage, the present *Tables* are unrestricted by any such arbitrary rule. Inasmuch as a large proportion of the compounds with which it deals are those which in the Beilstein classification appear to be inadequately described because of their earlier position in the sequence, users will quickly appreciate the added convenience of a generous treatment of the chemistry involved.

D. Preliminary tests

For certain of the more common compounds included in these *Tables*, there exist specific or semi-specific color tests. These are generally simple to execute, may often be applied satisfactorily to minute amounts of material, and, when positive, are so significant that their trial, if indicated, should invariably precede the derivatization of the sample. Such tests are indicated by the symbol Φ but should be regarded as merely preliminary in character and not always carrying the same conviction as the derivatives.

E. Derivatives

The text section of each numbered compound is usually concluded by a group of derivatives. Those which for one reason or another have special importance are designated by the symbol O placed at the left-hand side of the page. Interspersed with such cases will frequently be found others not bearing this symbol but instead merely designated by a dash. Relatives of the original parent compound so designated comprise materials, knowledge of whose existence (or less commonly nonexistence) or properties may be needed for comparison with related cases for the particular parent or other isomers thereof. Wherever possible, specific data on each relative included in this derivative section are given; in many cases, however, where careful systematic search has failed to uncover any published record of the compound. it is characterized in these tables as "unreported." All chemists recognize that reliable information that a particular compound has not yet been reported is more to be desired than its complete omission; and this feature of this volume will effect substantial economies of time for its users. Naturally, as time goes by the constant publication of new data will enable some of these informational gaps to be filled.

More than one value for the melting point of a particular product derived from a numbered parent or, conversely, several citations for the same value will often be noted through all parts of this book. These practices serve, respectively, to suggest caution because of lack of agreement and to attract attention to the concordance of results of several different workers.

The sequence in which these derivatives are listed has no relation to their

respective merits as means of identification of the particular parent. For each class of compounds, the particular sequence is arbitrary but standard in form and sequence in order to facilitate intercomparison and easy reference. For any particular class, however, the sequence is similar to that employed in Order 1 for the corresponding nonchlorinated parent.

F. Literature references

The fifth and final section of the descriptive material comprising each serially numbered compound comprises the corresponding references to the chemical literature. These are associated with the corresponding portions of the descriptive text by arbitrary numbers set in bold-face carets, e.g. (5), the journal names being uniformly represented by the standard abbreviations employed by Chemical Abstracts. The single exception to the use of Chemical Abstracts abbreviations for literature references is that the German journal recently known as Chemisches Zentralblatt (but formerly as Chemisches Centralblatt) is here designated as Cent. This convention adequately suggests the name of the periodical in less space and improves the corresponding Beilstein abbreviation (C.) by avoiding confusion with Centigrade temperature.

The total number of such literature references in this book is very large, owing in part to the greatly increased scope of this Order 3 as compared with the restricted treatment of compounds of Order 1. It will be observed that, in addition to a much fuller record of the four fundamental physical constants, and a more generous regard for a diversified array of derivatives, this book (unlike its predecessor) deals extensively with the preparation and chemical behavior of its component species. Furthermore, whereas the earlier book arbitrarily excluded references to the patent literature, the present volume not only permits their inclusion but draws rather heavily upon it. The rapid growth of industrial organic chemistry, the fact that numerous chloro compounds of Order 3 represent individuals of great industrial significance, and the circumstances that for many such cases a large proportion of the available information is of such recent origin that little of it can be found in conventional monographs or other compendia have combined to necessitate considerable emphasis on the technical literature.

For a given individual numbered compound, a particular published article or patent is listed *only once*. The citation number representing the reference may be given many times in the descriptive text, but in the literature reference section the reference itself is not repeated. On the other hand, a given original article covering several individual compounds included in this book will be cited under each of the materials to which the article is relevant.

The order in which the literature references are arranged is determined, by the sequence in which necessity for their mention arises in the text. This

results, of course, in what may appear to be a random sequence. The author is well aware that rearrangement of these references into a sequence comprising an alphabetical author index is possible. Such an operation, however, has been regarded as impracticable since it would multiply severalfold the opportunity for error and would be unlikely to confer advantages commensurate with the labor involved.

Literature references to journals considered to be generally accessible are given directly; but those to articles in journals with limited circulation or to articles in languages other than English, German, French, or Italian are usually accompanied by the location of the corresponding abstract in both the Chemisches Centralblatt and the Chemical Abstracts. This leads to the suggestion that users of this book, to whom a particular primary publication may be inaccessible, may themselves locate the corresponding abstracts by means of the usual Author Indexes to these works. Consultation of the abstract must never be regarded as equivalent to examination of the original publication but is generally better than no information at all.

Citations to original articles in scientific journals often refer to individual pages but sometimes also to a spread of pages, depending upon the nature of the article. The practice so frequently employed by others of citing an article merely by giving its initial page and leaving to the reader the often laborious job of locating the individual page germane to the aspect in question is deplored by the present author and has been avoided in this book. a page spread (occasionally extending to the whole of a particular article) is cited, the reason is usually that the construction of the original paper is such that relevant material is scattered throughout the paper and individual page citation might be not only inadequate but even misleading. Since a given article appears (in general) but once in the group of literature references associated with each numbered compound, however, and since therefore the single number representing it may be used many times during the various aspects of the corresponding text, users finding that one of several individual pages so cited is inapplicable will recognize it is to be associated with some other aspect elsewhere in the text.

Attention is called to certain advantageous and unique practices followed by this book in connection with its citations of patents. The first element of patent citation is the name of the inventor (or of all, if more than one) if this information is known. The second element comprises the name of the company to which the patent has been assigned. All American patents are required by law to be issued to the inventors but are commonly assigned to the sponsor of the work. Foreign patents, however, do not always carry the names of individual inventors; in that event the company name has to serve both purposes. The third element is the nationality and number of the patent accompanied by its date of *issue* (not application). The fourth

15 INDEXES

element comprises reference to abstracts of the patent both in the *Chemisches Centralblatt* and in *Chemical Abstracts*. There are three reasons for this multiple form of abstract reference.

The first is that few chemists have immediate access to the corresponding original patents themselves and appreciate the convenience of the abstract. The second is the plain fact that the patent abstracts published by the Chemisches Centralblatt are usually so much more descriptive and more nearly complete than those of Chemical Abstracts that many chemists prefer to use the former. Doubters of this difference of quality between the two abstract journals are invited to convince themselves by direct comparison. Finally, the Chemical Abstracts reference is also included, however, because there may be some users of this book to whom the Centralblatt may not be available or who are timid about their ability to read even technical German. If in a particular case the patent has not been abstracted at all, this fact is also noted. Furthermore, because of the present inaccessibility of more recent issues of the Centralblatt, it has been necessary in some of the more recent references to cite only Chemical Abstracts.

In connection with the citation of patents, many instances will be noted in which the reference includes also the equivalent patents of other countries, each of these being accompanied by its dates, abstract references, etc., as for an individual patent.

The reader's attention is directed to the obvious fact that many patents are expressed in general terms so that, even though the protection sought may frequently cover one or more of the component compounds of this book, the specific individuals are not mentioned by name. No attempt has been made to interpret such general patents. For this reason systematic searchers will often consult higher or lower homologs of the compound comprising their initial interest.

6. Abbreviations

Necessity for economy of space has required in this book a continuation of the extensive set of abbreviations used with the earlier Tables of Order 1 together with certain additions required by new circumstances. All these abbreviations have been selected so as to suggest the full word, particularly when assisted by the context. No attempt has been made to enslave the text to the abbreviations, however, and the full word is sometimes employed even though a mnemonic for it is given in the Table of Abbreviations.

7. Indexes

This book contains five different types of indexes; three of these are distinctly novel and two are conventional, as explained below.

A. The empirical formula index

The index of empirical formulas lists each of the compounds in this book in the conventional familiar form under one or another of four parts according to whether the particular compound contains (1) only carbon and chlorine; (2) carbon, oxygen, and chlorine; (3) carbon, hydrogen, and chlorine; (4) carbon, hydrogen, oxygen, and chlorine. Within each of these parts the individual empirical formulas are arranged in groups according to increasing numbers of carbon atoms, and for a given number of carbon atoms according to increasing numbers of the other component atoms. Within each group of isomeric compounds the order of listing follows the sequence of the eight units comprising the Chemical Type Index (see below).

This empirical formula index contains also for each group of isomers both the molecular weight and the percentage chlorine content, each computed to one place of decimal units. This index not only serves as a convenient record of these constants but also suggests to the user isomers of the particular individual. The formula index may also be employed occasionally as a final verification of the presence or absence of a particular compound from the *Tables*, in possible instances where the names which occur to the worker do not appear in the alphabetical index.

A brief statistical analysis of this index may be of interest. The 1320 individual compounds comprising this book are distributed among 366 groups of isomers as follows:

		Groups of Isomers	Individuals
Part A	C/Cl compounds	11	11
Part B	C/O/Cl compounds	18	21
Part C	C/H/Cl compounds	135	566
Part D	C/H/O/Cl compounds	202	722
	Total	366	1320

The minimum number of isomers for a given empirical formula is obviously one; 28 of the above 366 groups represent such minimum cases. The maximum possible number of individual compounds within a particular empirical formula is, of course, indeterminately large; however, it is of interest to note that, of the 366 groups of isomers in this book, the largest number of individual compounds (21) occurs for the empirical formula $C_8H_7O_2Cl$. Other formulas with substantial numbers of individuals comprise $C_5H_9O_2Cl$ with 20, $C_7H_{15}Cl$ and $C_8H_{17}Cl$ each with 18, $C_5H_{10}Cl_2$ with 17, and $C_6H_{11}Cl$, $C_6H_{18}Cl$, and C_8H_9OCl each with 16, corresponding to a particular molecular weight.

B. Index of empirical formulas by percentage chlorine content

This index lists the 366 empirical formulas of the numbered compounds contained in this book in order of diminishing percentage of chlorine. This

17 INDEXES

type of index is unique; nothing of this sort exists in any other publication so far as is known. Many uses of such an index will suggest themselves, the most obvious example being to suggest various empirical formulas corresponding to a particular chlorine content.

Within this index will be observed many examples of identical chlorine contents for several different formulas; e.g., a percentage chlorine of 37.5 is common to the four different formulas C₂H₃O₂Cl, C₃H₇OCl, C₈H₆OCl₂, and C₁₄H₉Cl₃, despite the fact (as seen from the Empirical Formula Index) that the molecular weights of the last two are quite different from the others.

C. Index of empirical formulas by molecular weights

This index lists the 366 empirical formulas of the numbered compounds contained in this book in order of increasing magnitude of molecular weight. This index (like the preceding one) is unique, and nothing of the sort exists in any other publication so far as is known. Many uses of this index will suggest themselves, the most obvious example being to suggest various empirical formulas having the same molecular magnitude.

Within this index will also be observed many examples of identical molecular weights for several different formulas; e.g., the molecular weight of 136.6 is common to the three different formulas C₅H₉O₂Cl, C₆H₁₃OCl, and C₈H₅Cl.

D. Index of compounds according to chemical types

Since, as more fully explained earlier in this chapter, the component individuals of this book are not arranged in arbitrary genera and no standardized generic tests comparable to those of Order 1 have as yet been developed, the inclusion in this volume of an index in which the compounds are arranged according to the chemical classes to which they belong is of special value and utility.

In this chemical-type index, each compound is listed in at least one of eight chemical classes (units) as follows:

- Unit 1. Chloro substitution products of saturated acyclic hydrocarbons.
- Unit 2. Chloro substitution products of unsaturated acyclic hydrocarbons.
- Unit 3. Chloro substitution products of cyclic hydrocarbons.
- Unit 4. Chloro substitution products of hydroxy compounds (alcohols or phenols).
- Unit 5. Chloro substitution products (and their relatives) of carbonyl compounds (aldehydes, ketones, quinones, aldehyde polymers, acetals, alcoholates, etc.).
- Unit 6. Chloro substitution products of carboxylic acids and anhydrides.
- Unit 7. Acyl chlorides.
- Unit 8. Chlorine substitution products of ethers and of esters.

Compounds of the last five units containing more than one functional group are also listed under such of the others as may be appropriate. For example, 2,5-dichloro-3,6-dihydroxybenzoquinone-1,4 is listed both as a

carbonyl compound (Unit 6) and as a phenol (Unit 4); diethylene glycol mono(chloroacetate) is listed not only as an ester (Unit 8) but also as an alcohol (Unit 4) and an ether (Unit 8).

It may be of interest to summarize briefly the distribution of the compounds in this book among the several classes as shown in the following summary:

Unit 1	221	Unit 5	146
Unit 2	182	Unit 6	137
Unit 3	174	Unit 7	142
Unit 4	211	Unit 8	182

The total number of such unit listings (1395) thus exceeds the number of individual compounds (1320) by an amount representing the cases of multiple functions.

E. Alphabetical Index

This conventional type of index includes not only the "principal" name, but also all the subsidiary names given in the Tables for every numbered compound in this book. It cannot, of course, guarantee to contain every name which might conceivably be applied since, for the field of chemistry, such names are legion. However, with every name that is listed is associated the corresponding location (or serial) number, so that use of this index is perfectly straightforward and the index requires no cross referencing within itself. The first letter of the first syllable of the name proper establishes its position in the alphabetical sequence irrespective of any literal or numerical prefixes such as o-, m-, p-, sec-, ter-, cis-, trans-, α -, β -, γ -, δ -, d-, l-, meso-. Within a particular group of isomers with the same name, however, the sequence is o-, m-, p-; sec-, ter-; or α -, β , γ -, δ , etc. Iso is not construed as a prefix but as part of the main root. Further details of this sort are given in the introduction to the index itself.

CHAPTER II

M.P. B.P. 8-9° (1) 140° at 37 mm., sl. dec. (5) D_-^{25} = 1.08815 (9) n_D^{25} = 1.58065(9) 8° (2) 125-126° at 22 mm. (6) D_+^{15} = 1.101 (6) n_D^{12} = 1.587 (8) 7-8° (3) 120° at 18 mm. (6) D_+^{12} = 1.090 (8) 4-9° (4) 117-119° at 17 mm. (7) 118° at 15 mm. (8) 115° at 13 mm., sl. dec. (5) 119.5-120.5° at 12 mm. (9) 116-117° at 12 mm. (10) 106° at 10 mm. (11) 109-110° at 6 mm. (3) 102-103° at 5 mm. (3) 101.5-103.4° at 5 mm. (12) 94° at 5 mm. (13) 86-87° at 2 mm. (3)

Care should be taken to avoid confusion of \bar{C} with the acid chloride of cinnamic acid; the acid chloride is properly designated as cinnamoyl chloride (3:0330); furthermore note that some of the older publications designate \bar{C} as "styryl chloride," which is now incorrect since in current usage the name styryl is reserved for the radical $C_6H_5.CH$ —CH— derived from styrene (14).

Attention is also drawn to the fact (not fully recognized in the older work) that in some (but not all) reactions of \bar{C} the prods. obtained may in part be derived from the synionic mesomer of \bar{C} , viz., phenyl-vinyl-carbinyl chloride (3-chloro-3-phenylpropene-1); for examples see below.

 \tilde{C} when pure is colorless oil with no odor of HCl; if HCl is present \tilde{C} soon darkens on stdg. — \tilde{C} should leave no residue on distillation, and best yields of RMgCl (see below) are obtainable only with freshly distilled \tilde{C} (3).

[For prepn. of \bar{C} from cinnamyl alc. (1:5920) with HCl gas at 0° (yields: 92–93% (1), 78% (7), 60% (12)) (5) (6) (15), with HCl gas in CCl₄ soln. at room temp. (85% yield (7)), with 6-7 wt. pts. 6 N HCl on distn. (79% yield (4)), or with conc. HCl + ZnCl₂ in C₆H₆ (54% yield (16) see indic. refs.; from cinnamyl alc. (1:5920) with PCl₃ in C₆H₆ (62.5% yield (1)), or PCl₃ + ZnCl₂ in C₆H₆ (65% (16)) (note that PCl₅ + ZnCl₂ in C₆H₆ gave only tar (16)); from cinnamyl alc. (1:5920) with SOCl₂ + pyridine in CHCl₃ (yields: 83% (3), 69–75% (12)), with SOCl₂ + diethylaniline (18) or other tertiary bases (18), or with excess SOCl₂ in C₆H₆ (72% yield (16)) see indic. refs.; from cinnamyl ethers by cleavage with HCl (22° B6) on htg. under press. see (8); from cinnamyl acctate (see below) by passing in dry HCl see (18).]

[For prepn. of Č from phenyl-vinyl-carbinol [Beil. VI-572, VI₁-(283)] (7) with HCl gas (7) (10) or with p-nitrobenzoyl chloride in ether on htg. in s.t. (10); from phenyl-vinyl-carbinyl acetate with HCl gas see (19).]

Č with Br₂ (1 mole) adds 2 atoms halogen yielding (20) (6) (10) α,β -dibromo- γ -chloro-n-propylbenzene, tbls. from ether, m.p. 104- 105° (6) (10).

C with conc. HI (D = 1.7) (3 wt. pts.) in AcOH (7) or C with KI in dry acctone (11) gives in good yield (7) cinnamyl iodide, pale yel. lfts., which after very careful recrystn. from AcOH have m.p. 57° (7); note, however, that the substance is very unstable, cf. (7) (11).

[\bar{C} on htg. with salts of acids yields a mixt. of the corresp. esters of cinnamyl alcohol (1:5920) and phenyl-vinyl-carbinol, the proportions of which vary with the nature of the acid radical, the metal, solvent, etc.; for extensive study of the reaction see (19) (7).] — [For behavior of \bar{C} with ethyl sodioacetoacetate (21), Ag salt of 3-hydroxynaphthoquinone-1,4 (2), or with 1,5-dichloroanthrone + aq. KOH (22) see indic. refs.]

 \bar{C} readily hydrolyzes to the corresp. alc. (1:5920): e.g., \bar{C} with aq. on boilg. for 1 hr. is 75% saponified (7); \bar{C} with boilg. aq. 1 N NaOH is 95% hydrolyzed in 1 hr. (7); note, however, that \bar{C} is remarkably stable toward strong aq. alk. in cold (e.g., with 3.5 vols. 53% aq. NaOH only trace of hydrolysis even after 8 hrs. shaking (7)); note also that the cinnamyl alc. (1:5920) obtd. by hydrol. is contaminated with di-cinnamyl ether, b.p. 231–232°, and probably also by the ether from phenyl-vinyl-carbinol. — \bar{C} (10 g.) with excess cold dil. aq. Na₂CO₃ on shaking 85 hrs. gives phenyl-vinyl-carbinol (1.3 g.) + cinnamyl alc. (1:5920) (0.7 g.), di-cinnamyl ether (2.6 g.) + unhydrolyzed chlorides (4.1 g.) (7).

[C with abs. alc. KOH yields only (7) cinnamyl ethyl ether; note, however, that the course of the reaction is modified by pres. of aq. and that C with NaOH in 70% aq. alc. the cinnamyl ethyl ether is accompanied by 25-30% of ethyl phenyl-vinyl-carbinyl ether (7); furthermore C with silver oxide in abs. alc. (thus even in absence of aq.) gives both ethers (7) (for numerous details see (7)).]

[The behavior of \bar{C} with NH₃ (or amines) is doubtless similarly influenced by the environment but has been less thoroughly studied. — \bar{C} in ether with large excess conc. aq. NH₄OK on stdg. gives (77% yield (23)) tetracinnamylammonium chloride, ndls. from alc., m.p. 199° (23); \bar{C} with abs. alc. NH₃ gives (24) (25) (5) mono-, di- and tri-cinnamylamines.]

Č with tertiary amines forms quaternary salts: e.g., Č with Me₃N in abs. EtOH 24 hrs. at room temp. gives (26) (25) cinnamyl-trimethyl-ammonium chloride, very hygroscopic solid (for derivatives see (25) (26)); for quaternary salt formn. of C with dimethylaniline (15) or pyridine (6) (5) see indic. refs.

[\bar{C} (1 mole) with aniline (4 moles) in ether as directed gives (50% yield (27)) N-(cinnamyl)-aniline, m.p. 21°, b.p. 200–202° at 12 mm., 178° at 3 mm. (27); \bar{C} (1 mole) with hexamethylenetetramine (1 mole) in aq. alc. as directed gives (20–30% yield (8)) cinnamaldehyde (1:0245).]

 \bar{C} (freshly distilled) with Mg in dry ether under special conditions gives (83% yield (3)) (12) RMgCl: note carefully, however, that this Grignard is (or behaves as) a mixture consisting of 27% cinnamyl MgCl, C_6H_5 —CH=CH.CH₂MgCl, accompanied by 73% phenyl-vinyl-carbinyl MgCl, C_6H_5 —C(MgCl).CH=CH₂ (12).

[The reactns. of the Grignard mixture thus obtd. from C therefore generally yield prods. corresponding to both the components sometimes accompanied by material originating from coupling reactns. of RMgCl (either or both types) with itself:e.g., RMgCl (designating the above mixture) on acid hydrolysis with 3 N H₂SO₄ gives not only both propenylbenzene [Beil. V-481, V₁-(231), V₂-(371)], b.p. 176°, and allylbenzene [Beil. V-484, V₁-(233), V₂-(373)], b.p. 156° (from the two RMgCl types) (combined yield 47% (12)), but also a high-boilg. residue (81% yield (12)) (from coupling of RMgCl, see below).]

[Č (2 moles) with Mg (1 atom wt.) in dry ether subsequently hydrolyzed gives a highboilg. fractn. consisting of a solid and a liquid hydrocarbon: the solid hydrocarbon (8-9% yield (28)) (1) is 1,6-diphenylhexadiene-1,5 (dicinnamyl) [Beil. V_1 -(338), V_2 -(597)], lfts. from alc. or AcOH, m.p. 82° (1), 81-82° (29), b.p. 211° at 11 mm. (1), 180° at 5 mm. (29); the liquid hydrocarbon (42.9% yield (28)) has now been recognized (28) (contrary to earlier views (1)) as 1,4-diphenylhexadiene-1,5, b.p. 157-160° at 2 mm., $D_{20}^{20} = 0.9919$, $n_{D}^{20} = 1.5890$ (28). — For mode of formation of these prods. see (28).]

[\bar{C} converted to RMgCl (see above) and reacted with NH₂Cl at -20° gives (14% yield (33)) cinnamylamine.]

- Φ Phenyl-vinyl-acetic acid: cryst. from pet. ether at -10° , m.p. $23-24^{\circ}$ (30). [From RMgCl with CO₂ (note that ord. method gives low yields (38% (3) cf. (17)) but simple modification of carbonation technique raises yield to 62-66% (3)).]—This acid on htg. or on warming with either alk. or acid isomerizes (by change in position of double bond) to α -phenylcrotonic acid (methylatropic acid) [Beil. IX-615)] (see also next paragraph).
- α-Phenylcrotonic acid (methylatropic acid): pr. from alc., ndls. or lfts. from aq., m.p. 135-136° (17) (p-nitrobenzyl ester, m.p. 80-81° (31)) (see also preceding paragraph). [From RMgCl (above) with ethyl chloroformate (3:7295) followed by hydrolysis of the intermediate ethyl phenyl-vinyl-acetate by htg. with 20% HCl or by shaking for 2 days with alkali (the hydrolysis being accompanied by simultaneous rearr. of the unsatd. linkage) (30).]
- **D** Phenyl-vinyl-acetic anilide: cryst. from C_6H_6 , alc., or CHCl₃, m.p. 97-98° (30). [From RMgCl (above) with phenyl isocyanate in dry ether (30); this prod. may be accompanied by a small amt. of α -phenylcrotonanilide, m.p. 192°, from partial somerization during the reactn. (30).]
- N-(Cinnamyl)phthalimide: cryst. from 90% alc. or 90% AcOH (24) or from n-PrOH (32), m.p. 156° (32), 153° (24). [From C with K phthalimide by htg. at 160° for several hrs. (24); note that the structure of this prod. has been confirmed as the cinnamyl (and not the phenyl-vinyl-carbinyl) type (32).]

 $73-90^{\circ}$ at 1×10^{-4} mm. (10) (see text)

Note that \bar{C} shows dimorphism: the transparent α -variety, f.p. 7.4° (no supercooling), when seeded with cryst. which had been cooled to 0°, changes to a white (opaque) βmodification, m.p. 12.1° (5).

PREPARATION OF C

[For prepn. of C from hexadecanol-1 (cetyl alc.) (1:5945) with dry HCl gas + 1% ZnCl₂ at 160-170° for 6 hrs. (94% yield (11)) or in EtOH with dry HCl gas 6 hrs. at 100° (yield unreported (1)) see indic. refs.; note that using 1% ZnCl₂ yield in 6 hrs. at 130° is 86.8%, rises to a max. of 94.6% at 160° , then falls off again to 89% at 200° (11); note also that in absence of any cat, yield at 160° is only 59% even after 20 hrs. and that with other cat. yields are low (11).]

[For prepn. of \bar{C} from hexadecanol-1 (cetyl alc.) (1:5945) with conc. $HCl + ZnCl_2$ (yields: 65% (4), 62% (2)), with PCl₅ (1 mole) at 135° for 5 hrs. (yield unreported (7)) cf. (6), with SOCl₂ (excess but without pyridine) (87-89% yield (2)) see indic. ref. — For form. of \bar{C} from cetyl alc. + PCl₅ (in pres. of mesityl oxide + Ac₂O) (61.5% yield) see (10). — For form. of \bar{C} from cetyl alc. with PCl₃ see (5), but note that prod. always conts. unchanged cetyl alc. (1:5945) and cetene-1 (1:7000) (12) cf. (2).

[For prepn. of C from cetyl stearate (1:2193) with dry HCl gas (97% yield (11)), from

cetyl acetate (1:2038) with dry HCl gas + ZnCl₂ at 180° (13) see indic. refs.]

[For formn. of C from a mixt. of K palmitate + K chloroacetate by electrolysis see (8).]

PHYSICAL BEHAVIOR OF C

[For study of electrophoretic mobility of emulsions of C see (14).]

CHEMICAL BEHAVIOR OF C

WITH INORGANIC REACTANTS

With metals. [\bar{C} with Li in dry ether under N₂ gives (100% yield (15)) C₁₆H₃₃Li; on carbonation of mixt. with CO₂ this is converted (51% yield (15)) to n-heptadecanoic acid (margaric acid) (1:0635): note, however, that \bar{C} with Li in pet. eth. (b.p. 30-35°) gives (15) only 63% yield C₁₆H₃₃Li and this on carbonation only 27% overall yield of margaric acid accompanied by other prods. — For analogous reacts. of \bar{C} with Na see (15) (16); for react. of \bar{C} with Ca in dry ether under N₂ see (15).]

 \bar{C} with Mg in dry ether + trace I₂ gives in 6 hrs. (96% yield (1)) C₁₆H₃₃MgCl.

With NH₃. [C with liq. NH₃ in alc. in s.t. at 170° for 24 hrs. gives (70% yield (17)) di-n-hexadecylamine, cryst. from alc., m.p. 65°, b.p. 220° at 3 mm. (17), accompanied by (24% yield (17))n-hexadecylamine, m.p. 45°, b.p. 146-148° at 3 mm. (B.HCl, lfts. from abs. alc., m.p. 178° (17)).]

With misc. inorg. reactants. [C over spec. prepd. Al₂O₃ at 250° loses HCl giving (94% yield (18)) of a mixt. of hexadecenes together with other prods.]

[C with KOH at 200-300° gives (19) palmitte acid (1:0050); C with alc. KSH gives (21) n-hexadecyl mercaptan; C with alc. K₂S gives (21) di-n-hexadecyl sulfide.

 $[\bar{C} \text{ with Na}_2SO_3.7H_2O \text{ (6 moles) at 190-200}^{\circ} \text{ for 8 hrs. under press. gives (98% yield (20))}$ sodium cetanesulfonate-1.]

[For study of rate of reactn. of \bar{C} with KI in acctone at 50° and 60° see (3).]

WITH ORGANIC REACTANTS

[\tilde{C} with alc. KOH gives (5) ethyl *n*-hexadecyl ether, f.p. 19.9° (5); \tilde{C} with sodium allyl oxide refluxed 30 hrs. gives (70% yield (22)) allyl *n*-hexadecyl ether, pl. from aq. alc., m.p. 25° (22).]

[\bar{C} (1 mole) with 33% alc. MeNH₂ (1 mole) in s.t. at 140-150° for 18 hrs. gives (68% yield (17)) N-methyl-di-n-hexadecylamine, ndls. from alc., m.p. 36-37°, b.p. 269-271° at 1 mm. (17) accompanied by (15% yield (17)) N-methyl-n-hexadecylamine, b.p. 147-150° at 1 mm. (\bar{B} .HCl, m.p. 169-170° (17)). — \bar{C} (1 mole) with Mc₂NH (2 moles) in alc. in s.t. at 140° for 14 hrs. gives (82.5% yield (17)) N,N-dimethyl-n-hexadecylamine, b.p. 158° at 3 mm. (\bar{B} .HCl, lfts. from AcOEt/dioxane 5/1, m.p. 198° (17)).]

Č with tertiary amines gives by addn. the corresp. quaternary ammonium salts [e.g., C with Me₃N (2 moles) in alc. in s.t. at 100-105° for 12-16 hrs. (17), or C with Me₃N (1 mole) in closed bottle at 110° for 5 hrs. (7), gives (100% yield (17)) trimethyl-n-hexadecyl-ammonium chloride, hygroscopic lfts. from AcOEt/alc., m.p. abt. 70° (17); for study of surface tension of aq. solns. of this salt see (7)].

 \tilde{C} with pyridine (1 mole) in s.t. at 110° for 15 hrs. (23) or at 120° for 8 hrs. (7) gives *n*-hexadecyl-pyridinium chloride, cryst. with 1 H₂O from alc./ether or C₆H₆, m.p. 83° (23), 82° (24) [for study of surface tension (7), conductivity (24), and elec. potential (24) of aq.

solns. of this salt see indic. refs.; for cat. hydrogenation of this salt to N-(n-hexadecyl) piperidine.HCl, m.p. 180° see (23); for study of favorable effect of press. on reactn. of $\tilde{\mathbf{C}}$ with pyridine see (12).

[For analogous reactn. of \bar{C} with N,N-dimethyl-benzylamine (17) or with isoquinoline (23) see indic. refs.]

[For reactn. of \bar{C} with α -picoline + NaNH₂ yielding α -(n-heptadecyl)pyridine, m.p. 23.5°, b.p. 206° at 2.5 mm., \bar{B} .PkOH, m.p. 87°, or of \bar{C} with γ -picoline + NaNH₂ yielding γ -(n-heptadecyl)pyridine, m.p. 33°, b.p. 207–210° at 2.5 mm., \bar{B} .PkOH, m.p. 115°, see (9).]

- --- n-Hexadecyl p-nitrobenzoate: m.p. 58.4° cor. (25). [Prepd. indirectly.]
- --- n-Hexadecyl 3,5-dinitrobenzoate: m.p. 66°. [Prepd. indirectly.]
- --- N-(n-Hexadecyl)phthalimide: unreported.
- ---- S-(n-Hexadecyl)isothiourea hydrochloride: m.p. 126-128° (26). [From C with thiourea in alc. on refluxing 3-4 days (26).]
- —— n-Hexadecyl mercuric chloride: cryst. from pet. eth. or AcOEt, m.p. 114-115° (15). [Prepd. indirectly; note that m.p. of mixts. of this prod. with either n-C₁₂H₂₅HgCl (m.p. 114-114.5°) or C₁₈H₃₇HgCl (m.p. 115-116°) is depressed (15).]

Cryst, from ether + pet. ether; spar. sol. aq.

[For prepn. of \bar{C} from γ -chloro-n-butyronitrile (itself prepd. (60-70% yield (6)) from trimethylene chlorobromide) or from methyl γ -chloro-n-butyrate (3:8517) (10) by hydrolysis with conc. HCl (4) (5) (1) (2) see indic. refs.: from γ -butyrolactone (1:5070) with dry HCl see (1); from cyclopropanecarboxylic acid [Beil IX-4, IX₁-(3)] in ether with dry HCl at 0° see (3); from n-butyric acid (1:1035) with SO₂Cl₂ + dibenzoyl peroxide in CCl₄ (45% \bar{C} + 10% α - and 45% β -isomers) see (7).]

 \bar{C} on htg. above 180° loses HCl yielding (8) γ -butyrolactone (1:5070), b.p. 206°.

 $\ddot{\mathbf{C}}$ with alcs. yields corresp. esters (for study of rate of esterification of $\ddot{\mathbf{C}}$ with EtOH see (9)). — $\ddot{\mathbf{C}}$ with SOCl₂ yields γ -chloro-n-butyryl chloride (3:5970) q.v.

- ---- Methyl γ -chloro-n-butyrate: b.p. 175° (see 3:8517).
- Ethyl γ -chloro-n-butyrate: b.p. 186° (see 3:8597).
- \bigcirc γ -Chloro-n-butyramide: m.p. 88-90° (8). [From Me γ -chloro-n-butyrate (3:8517) with NH₄OH (8).]
- \mathfrak{D} γ -Chloro-n-butyr-anilide: lfts. from C_6H_6 + pet. eth., m.p. 69-70° cor. (2) (10). [From γ -chloro-n-butyryl chloride (3:5970) with aniline in ether (2) or C_6H_6 (10).] [This prod. on fusion with 3 pts. KOH yields (2) (by ring closure) N-phenyl- α -pyrrolidone [Beil. XXI-237], m.p. 68-69° cor. (2).]

White cryst. from dry ether, melting to colorless liq.

[For prepn. of $\bar{\mathbb{C}}$ from α -crotonic acid (1:0425) by satn. of ether soln. with dry HCl (1) (7) (8), or with aq. HCl at 80–100° in s.t. (5), or by boilg. with 20% HCl (9) see indic. refs.; from allyl cyanide with fumg. HCl at 50–60° see (10); from 3-chlorobutanol-1 (3:9165) by oxidn. with alk. KMnO₄ see (11); from β -chloro-n-butyraldehyde (3:9110) by oxidn. with conc. HNO₃ see (12); for formn. of $\bar{\mathbb{C}}$ from n-butyric acid (1:1035) with SO₂Cl₂ + dibenzoyl peroxide in CCl₄ (45% $\bar{\mathbb{C}}$ together with 10% α -chloro and 45% γ -chloro isomers) see (13); for formn. of $\bar{\mathbb{C}}$ from β -amino-n-butyric acid in 25% aq. HCl with NOCl under press. see (14).]

 \bar{C} on htg. with theoret. quant. dil. aq. alk. loses HCl giving quant. yield (2) (11) α -crotonic acid (1:0425), m.p. 72°. [For study of velocity of reactn. of \bar{C} with H₂O at 150°C see (1), of rate of loss of HCl from Na \bar{A} by aq. at 70° see (15).]

 \tilde{C} with EtOH yields ethyl β -chloro-n-butyrate (3:8373) [for study of rate of esterification see (4)]; \tilde{C} with SOCl₂ yields (2) β -chloro-n-butyryl chloride (3:9100) q.v. [for study of behavior of \tilde{C} on cat. hydrogenation see (16)].

 \bar{C} with NH₃ gives (17) β -hydroxy-n-butyramide [Beil. III₁-(116)].

C on conversion to NaA, dislvd. in 2½ pts. aq. and stood 1 day with NaOAc + phenylhydrazine yields (18) (21) β-phenylhydrazino-n-butyric acid [Beil. XV-324], lfts. from alc., m.p. 111° (18) (21). [This prod. on warming with conc. H₂SO₄ ring-closes to 1-phenyl-5-methylpyrazolidone-(3), m.p. 127° (18) (21).]

- Methyl β -chloro-n-butyrate: b.p. 156° (see 3:8224).
- Ethyl β -chloro-n-butyrate: b.p. 169° (see 3:8373).
- --- \beta-Chlorobutyramide: unreported.
- β-Chloro-n-butyranilide: cryst. from dil. alc., m.p. 89-90° (18), 90° (19). [From β-chloro-n-butyryl chloride (3:9100) with aniline (18) in acetone soln. (19).] [This prod. on htg. with AlCl₃ gives (55% yield (19)) 4-methyl-2-keto-tetrahydroquinoline, m.p. 98° (19).]
- β-Chloro-n-butyro-p-toluidide: cryst. from dil. alc., m.p. 124° (19), 115° (20). [From β-chloro-n-butyryl chloride (3:9100) with p-toluidine (20) in acetone soln. (19).]
 [This prod. on htg. with AlCl₃ gives (57% yield (19)) 4,6-dimethyltetrahydroquinoline, m.p. 131° (19).]

 \bar{C} rapidly becomes turbid in contact with atmosphere and should be kept in sealed tubes (1). — \bar{C} on attempted distn. at ord. press. loses HCl and gives 1,1,2,2-tetraphenylethane [Beil. V-739, V₁-(371)] (20), m.p. 211°, and 1,1,2,2-tetraphenylethylene [Beil. V-743, V₁-(376)] (9), m.p. 227°.

[For prepn. of \bar{C} from diphenylcarbinol (1:5960) with dry HCl gas alone (9) (21), or in C_6H_6 (92% yield (14)), or in C_6H_6 + $CaCl_2$ (yield: 90% (1), 85% (3)) (11) (17), with SOCl₂ in toluene (93.3% yield (2)), with PCl₅ in POCl₃ (92% yield (14)), or with BeCl₂ (77% yield (8)) see indic. refs.; from diphenylmethane (1:7120) with PCl₅ at 170° (together with other products) (22) or with NOCl (together with other products) (23) see indic. refs.: for formn. of \bar{C} from diphenylcarbinyl MgBr with ClCN (42% yield + 8% diphenylacetonitrile + 5% 1,1,2,2-tetraphenylethane) see (10); from bis-(diphenylcarbinyl) ether in C_6H_6 with HCl gas (77% yield) see (11); from diphenylcarbinylhydrazine with boilg. dil. HCl see (24); from diphenyldiazomethane with HCl gas in ether at -80° see (25).]

[\bar{C} with molecular Ag in C_6H_6 in absence of O_2 gives 100% yield (19) of 1,1,2,2-tetraphenylethane (see first paragraph); in pres. of pure O_2 yield drops to 2-8% and other products are formed (19); \bar{C} in C_6H_6 refluxed some hours with Na gives (80-90% yield (14)) (9) (21) 1,1,2,2-tetraphenylethane (see first paragraph); \bar{C} with Na in liq. NH₃ gives (26) 1,1,2,2-tetraphenylethane (65% yield) + diphenylmethane (1:7120) (27% yield).]

 \bar{C} in dry ether treated with Mg + trace of I₂ immediately ppts. 1,1,2,2-tetraphenylethane whose yield may reach 95.5% (2); however, under special conditions (6) \bar{C} in ether with Mg + trace of I₂ gives (51-71%) corresp. RMgCl epd.; this prod. upon treatment with CO₂ gives (yield: 84% (6), 32.5% (2)) diphenylacetic acid (1:0765), m.p. 148°; the RMgCl epd. does not react (2), however, with phenyl isocyanate.

[Č with pure AlCl₃ immediately resinifies $\{11\}$; however, Č in C₆H₆ with AlCl₃ gives $\{11\}$ triphenyl-chloromethane (3:3410) + diphenylmethane (1:7120) with a very little triphenylmethane (1:7220).]

[C htd. with 20% aq. Na₂SO₃ soln. for 3 hrs. at 120° gives (100% yield (28)) (27) bis-(diphenylmethyl) ether [Beil. VI-679, VI₁-(326)], cryst. from alc., m.p. 109° (27), 110° (17); note that this reaction probably results from intermediate diphenylcarbinol and that none of the expected sulfonate can be isolated.]

[For reactn. of \bar{C} with phenols + ZnCl₂ yielding mono-, di- or tri-alkylated phenols according to conditions see (13) (29) cf. (30); for reactn. of \bar{C} with thiophenols see (31); for reactn. of \bar{C} with excess Br.Mg.C=C.MgBr giving (40-50% yield) 1,1,4,4-tetraphenyl-butine see (32); for reactn. of \bar{C} with anthrone + KOH see (33).]

 \bar{C} with aq. hydrolyzes yielding diphenylcarbinol (1:5960) or its reactn. products according to particular conditions; for extensive studies see (34) (12) (35) (18) (40) (35). — \bar{C} with EtOH undergoes alcoholysis yielding ethyl diphenylcarbinyl ether + HCl (for very extensive studies of this and related reactions see (1) (36) (4) (17) (37) (7) (35). — \bar{C} after warming with alc. may then be titrated quant. with stand. alkali using phenolphthalein (1).

^{——} Diphenylcarbinyl acetate [Beil. VI-680, VI₁-(326)]: cryst. from AcOH, m.p. 40-41°. [From C with KOAc in AcOH (22).]

Diphenylcarbinyl benzoate: cryst. from alc., m.p. 88-89° (39), 86-88° (38). [From C in C₆H₆ on shaking with silver benzoate (38); see also text under diphenylcarbinol (1:5960).]

M.P. 18° (1) 4° (2)

Cryst. from ether + pet. ether.

[For prepn. of \bar{C} from δ -phenoxy-n-valeric acid [Beil. VI-165] by htg. with fumg. HCl in s.t. at 180° see (2) (4); from diethyl γ -chloro-n-propylmalonate [Beil. II₁-(278)] with 6 N HCl see (3); from δ -iodo-n-valeric acid [Beil. II-304, II₂-(270)] by susp. in conc. HCl and htg. with AgCl see (1).]

 \bar{C} distils at 141-149° at 12 mm. with sl. decomp. (1). — \bar{C} on htg. between 195-240° at ord. press. evolves HCl and leaves a viscous oil (1). \bar{C} htd. very rapidly at ord. press. over a free flame yields (1) (2) a little δ-valerolactone (1:1139).

C with SOCl₂ yields (5) δ-chloro-n-valeryl chloride (3:9264), b.p. 75-80° at 5-8 mm. (5).

- Methyl δ-chloro-n-valerate: unreported.
- Ethyl δ-chloro-n-valerate: see 3:8727.
- ---- δ-Chloro-n-valeramide: unreported.
- ---- δ-Chloro-n-valeranilide: unreported.
- δ-Chloro-n-valero-p-toluidide: unreported.

56°

[For prepn. of \bar{C} from salicylic acid (1:0780) with SOCl₂ in boilg. C_6H_6 (80% yield (1) (7)) (4), with SOCl₂ + trace of AlCl₃ at 45-50° (2) (15), with COCl₂ (3:5000) in C_6H_6 in pres. of tertiary bases such as quinoline (8), or with oxalyl (di)chloride (3:5060) in C_6H_6 (98% yield (9)) see indic. refs.; for prepn. of \bar{C} from sodium (or other) salts of salicylic acid (1:0780) with SOCl₂ (yields: 38% (3), 36% (5)) (10) (11) (12) (13) (6) or with COCl₂ (3:5000) in toluene (14) see indic. refs.]

[\tilde{C} on htg. at 20 mm. begins to lose HCl at 110° yielding (1) polysalicylids; \tilde{C} in C_6H_6 with diethylaniline yields (1) α -disalicylid, cryst. from CHCl₃, m.p. 210-212° (1), c.f. (16) (17); \tilde{C} with PCl₅ yields α -Cl.CO.C₆H₄.OPCl₄ together with other P derivs. (17).

[For reactn. of \bar{C} with Na.C= $C-C_6H_5$ and ring closure of prod. to flavone see (18); for reactn. of \bar{C} with 1,3-dichloropropanol-2 (glycerol α,α' -dichlorohydrin) (3:5985) see (19).]

 \bar{C} with phenol at 50° yields (15) phenyl salicylate ("Salol") (1:1415), m.p. 42°. [For reactn. of \bar{C} with 2-iodoethanol yielding corresp. β -iodoethyl salicylate see (22); for reactn. of \bar{C} with alc. KSH yielding α -thiolsalicylic acid, m.p. 33° see (23).]

 \bar{C} with α -naphthylamine yields (20) salicyl- α -naphthalide [Beil. XII-1248], m.p. 187° (20); \bar{C} with β -naphthylamine yields (20) salicyl- β -naphthalide, m.p. 188-189° (20); \bar{C} (2 moles) with benzidine (1 mole) yields (21) N,N'-disalicyloylbenzidine (use in fixation of basic dyes on cotton (21)).

Č with urea in other yields (24) N-salicyloylurea (salicyl-monoureide) cryst. from AcOH or MeOH, m.p. 192° dec. (24).

[C with McOH presumably yields methyl salicylate (1:1750), b.p. 224°; C with EtOH yields ethyl salicylate (1:1755), b.p. 234°.]

C on hydrolysis presumably yields salicylic acid (1:0780) q.v.

 - M.P. 21° (1) B.P. 180-190° at 12 mm. (1) (2) 18° (2)

Care must be taken to avoid confusion of \bar{C} with the acid chloride of stearic acid which is often designated as stearoyl chloride (3:9960).

[For prepn. of \bar{C} from octadecanol-1 (stearyl alc.) (1:5953) with excess PCl₅ on htg. (no statement of yields) (1) (10) or with PCl₅ in SOCl₂ (100% yield (10)) see indic. refs.] [For study of heat of adsorption of \bar{C} on steel and its bearing on lubrication see (1); for study of electrophoretic mobility of emulsions of \bar{C} see (3).]

 \bar{C} with Mg in dry ether yields (4) n-C₁₈H₃₇MgCl [this prod. with cyclopentanone (1:5446) gives (4) a tertiary alc. which on dehydration with KHSO₄ yields (4) n-octadecylcyclopentene, b.p. 173-174° at 3 mm., m.p. 19°, $D_4^{20}=0.8462$; similarly C₁₈H₃₇MgCl with cyclohexanone (1:5465) gives (4) a tertiary alc. which with KHSO₄ loses aq. giving (4) n-octadecylcyclohexene, b.p. 179-180° at 3 mm., m.p. 20°, $D_4^{20}=0.8458$].

[\bar{C} with C_6H_6 + AlCl₃ undergoes Friedel-Crafts reactn. yielding (4) n-(?)-octadecylbenzene [Beil. V-473, V₁-(361)], m.p. 25–26°, b.p. 180–181° at 3 mm., $D_4^{20}=0.8566$, $n_D^{20}=1.4826$.]

 \overline{C} (1 mole) with pyridine (1 mole) in s.t. at 110° for 15 hrs. gives (5) the corresp. quaternary salt, N-(n-octadecyl) pyridinium chloride, cryst. from alc./ether or C_6H_6 as monohydrate, m.p. 82° (5), 86° (6); for study of conductivity and electric potential of latter see (6).

- --- n-Octadecyl p-nitrobenzoate: m.p. 64.3° cor. (7). [Prepd. indirectly.]
- ---- n-Octadecyl 3,5-dinitrobenzoate: unreported.
- ---- N-(n-Octadecyl)phthalimide: unreported.
- --- S-(n-Octadecyl)isothiourea: m.p. 83-85° (8). [Prepd. indirectly.]
- —— n-Octadecyl mercuric chloride: m.p. 115-116° (9). [Prepd. indirectly: note that m.p. of this prod. either with C₁₆H₃₃HgCl (m.p. 114-115°) or with C₁₈H₃₇HgBr (m.p. 110-111°) is depressed (9).]

[See also cis-2-chlorocyclohexanol-1 (3:9374).]

Both the two theoretically possible geometrical stereoisomers of 2-chlorocyclohexanol-1 are known. The single form obtained from cyclohexene (tetrahydrobenzene) by addn. of HOCl or from cyclohexene oxide by addn. of HCl is now regarded (3) as the *trans* isomer $\bar{\mathbf{C}}$. The *cis* form (3:9374) is obtd. by other methods.

Colorless pr. from mixt. of $C_6H_6+lgr.$ at low temp.; \bar{C} has characteristic odor, is vol. with steam.

[For prepn. of \bar{C} from cyclohexene (tetrahydrobenzene) (1:8070) with HOCl (yields: 70–73% (4), 70% (5)) (6) (7) (8) or with N-chlorourea (yield: 74% (26), 54% (9)) see indic. refs.; from cyclohexene oxide (see below) with conc. HCl or with ZnCl₂ in dry ether see (3); for probable formn. of \bar{C} from cyclohexene (1:8070) with EtOCl (3:7022) see (10); for formn. of a mixt. of both stereoisomeric 2-chlorocyclohexanols contg. 27–28% \bar{C} + 72–73% cis-isomer from 2-chlorocyclohexanone (3:0120) by reductn. with isopropyl MgCl, ter-butyl MgX, or cyclohexyl MgX see (3); for formn. of a mixt. (b.p. 78–80° at 12 mm.) of both isomers by hydrolysis of 2-chlorocyclohexanyl acetate see (11).]

C with aq. NaOH at room temp. gives (yields: 70-73% (12), 70-75% (5), 80% (9), 55% (13)) cyclohexene oxide (1,2-epoxycyclohexane) [Beil. XVII-21], b.p. 131.5° at 760 mm. [Note that reactn. of C with alk. is 300 times as fast as that of the cis isomer (3:9374) (use in detn. of proportion of C in mixts. of isomers), that the latter with alk. gives no epoxy cpd. but instead cyclohexanone, and finally that C can be separated from its isomer by conversion to cyclohexene oxide from which the remaining cis isomer can be sepd. by distn. (3).]

 \bar{C} with alk. or with alc. KCl is not converted to cis isomer (3) but \bar{C} on protracted htg. with HCl rearr. to a small extent to the cis isomer.

[For use of C as seed disinfectant see (15).]

The halogen atom of $\ddot{\mathbf{C}}$ is fairly reactive, but its replacement often involves rearr. of the cyclohexyl ring to a cyclopentyl ring.

[C on boilg, with dil. alc. slowly gives (1) trans-cyclohexanediol-1,2 [Beil VI-740] with cyclopentylformaldehyde (formylcyclopentane), the latter increasing in pres. of dil. H₂SO₄ or of CaCl₂ (1).]

[$\bar{\mathbf{C}}$ with NaOMe in MeOH yields (14) cis-2-methoxycyclohexanol-1 [Beil. VI-740], b.p. 181.5° at 760 mm., $D_{-}^{20}=1.015,\,n_{\mathrm{D}}^{20}=1.4605$ (14); $\bar{\mathbf{C}}$ with NaOEt in EtOH (14) (or $\bar{\mathbf{C}}$ in EtOH treated with Na in attempted reductn. (16) gives (87% yield (16)) cis-2-ethoxycyclohexanol-1 [Beil. VI-740], b.p. 187° at 760 mm., $D_{-}^{20}=0.982,\,n_{\mathrm{D}}^{20}=1.4563$ (14); $\bar{\mathbf{C}}$ with sodium n-propylate yields (14) 2-n-propoxycyclohexanol, b.p. 205° at 760 mm., $D_{-}^{20}=0.970,\,n_{\mathrm{D}}^{20}=1.4580$ (14); $\bar{\mathbf{C}}$ with sodium cyclohexanolate yields (14) 2-cyclohexanoxycyclohexanol, m.p. 50° (14).]

[C with C₆H₅.CH₂MgCl gives (54% yield (17)) benzyl-cyclopentyl-carbinol, b.p. 166-169° at 20 mm., m.p. 30° (3,5-dinitrobenzoate, m.p. 100.5-101.5° (17)). — C with excess MeMgI gives (50% yield (13)) mixt. of both cis and trans 2-methylcyclohexanols (1:6420). — C with cyclohexyl MgCl (cf. 3:8040) yields (18) cyclohexyl-cyclopentyl-carbinol, m.p.

34° (p-nitrobenzoate, m.p. 49-50°, 3,5-dinitrobenzoate, m.p. 102°, acid phthalate, m.p. 92-93°, N-phenylcarbamate, m.p. 122° (18)).]

[\bar{C} with conc. aq. NH₄OH shaken for 24 hrs. (19) or \bar{C} with NH₃ in alc. htd. in s.t. for 1 hr. (6) gives (yields: 71% (19), 61% (6)) cis-2-aminocyclohexanol [Beil. XIII-348], m.p. 65° (19) (6), b.p. 110° at 24 mm. (19). — \bar{C} with diethylamine (2 moles) htd. in s.t. at 150° for several hrs. (20) (or similarly with BuOH as solvent (21)) yields 2-(diethylamino)-cyclohexanol, b.p. 225° at 740 mm. (21), 224° at 730 mm. (20), $D_{25}^{25} = 0.9280$ (21), $n_{25}^{24} = 1.4659$ (21) (hydrochloride, m.p. 170.5–171.5° (21)). — \bar{C} with 5 pts. piperazine hydrate htd. 3 hrs. at 140° gives (22) both N,N'-bis-(2-hydroxycyclohexyl)piperazine, m.p. 205–206° (22), and N-(2-hydroxycyclohexyl)piperazine, m.p. 67–68° (22) (the latter separable by treatment of mixt. with CS₂ pptg. its dithiocarbamate).]

[$\bar{\mathbf{C}}$ also reacts as a secondary alcohol: e.g., $\bar{\mathbf{C}}$ with PCl₅ yields (14) 1,2-dichlorocyclohexane [Beil. V-22, V₁-(8)], b.p. 187–189°, $\bar{\mathbf{C}}$ with PBr₅ yields (14) 1-bromo-2-chlorocyclohexane, b.p. 94° at 17 mm., $D^{20} = 1.514$, $n^{20}_{D} = 1.5481$ (14).

C on oxidn. with K₂Cr₂O₇/H₂SO₄/AcOH gives (57% yield (9)) 2-chlorocyclohexanone (3:0120).

(Note: the following derivatives are listed as cis on the assumption of inversion during formation.)

- —— cis(?) 2-Chlorocyclohexanyl acetate: oil with odor like EtOAc, b.p. 95-96° at 11 mm. (23), 99-101° at 13 mm. (24), $D_{25}^{25} = 1.1182$ (23), $n_D^{25} = 1.46195$ (23). [From \bar{C} with AcCl at 10-20° (23) or in C_6H_6 (espec. in pres. of K_2CO_3 or $BaCO_3$) (70% yield (24)), or from cyclohexene (1:8070) with Ac_2O or with $Ac_2O + SO_2Cl_2$ in CHCl₃ (11). [This ester with MeOH + dry HCl gas yields \bar{C} (11). Cf. (25).]
- cis(?) 2-Chlorocyclohexanyl benzoate: lfts. from dil. alc., m.p. 120-121° (24). [From C with BzCl htd. 10 hrs. (70% yield) (24).]
- —— cis(?) 2-Chlorocyclohexanyl p-nitrobenzoate: cryst. from dil. alc., m.p. 240° dec. (24). [From Č with p-nitrobenzoyl chloride in dry ether or C₆H₆ + Na₂CO₃ refluxed 5 hrs. (70% yield) (24).]
- —— cis(?) 2-Chlorocyclohexanyl N-phenylcarbamate: m.p. 97-98° (2), 94-96° (17). [From C with phenyl isocyanate in lt. pet. (17).]
- —— cis(?) 2-Chlorocyclohexanyl N-(α -naphthyl)carbamate: m.p. 165° (3). [From \bar{C} with α -naphthyl isocyanate at 100° for 4 hrs (3)]

White ndls. from dil. alc.; eas. sol. alc., ether, C₆H₆.

[For prepn. of \bar{C} from *m*-chloroiodobenzene [Beil. V-220] by htg. with Cu powd. under various conditions (yield: 95% (5), 67% (2), 61% (1)) see indic. refs.; from 3,3'-dinitro-biphenyl with SOCl₂ in s.t. at 200–210° for 10 hrs. see (4); from 3,3'-dichloro-4,4'-diamino-biphenyl (3,3'-diaminobenzidine) [Beil. XIII-234, XIII₁-(67)] via tetrazotization and htg. with alc. see (6); from 3,3'-dichloro-2,4'-diaminobiphenyl via tetrazotization and treatment with H₃PO₂ see (3).]

Č on tetranitration, e.g., with mixt. of 5 pts. abs. HNO₃ + 20 pts. conc. H₂SO₄ for 2 hrs. at 100° {5}, yields {5} (7) 3,3'-dichloro-4,6,4',6'-tetranitrobiphenyl [Beil. V₁-(274)], m.p. 191° {5}, 189° (7), 184° {5}: note that this prod. appears to exist in two forms: when the lower-melting form is dislvd. in boilg. AcOH and pptd. with boilg. aq., or if it is allowed to solidify after fusion, the prod. has m.p. 191°; if the above AcOH soln. is slowly cooled, however, the prod. melts at 184° {5}. [This tetranitro-\bar{C} htd. with NaOMe in MeOH yields 3,3'-dimethoxy-4,6,4',6'-tetranitrobiphenyl, m.p. 244° {5}.] — [Note also that under some conditions {7} some 3,3'-dichloro-6,6'-dinitrobiphenyl [Beil. V-585, V₁-(274)], m.p. 170° {8} {7}, may form during nitration of \bar{C}.]

 \bar{C} on oxidn. with $CrO_3 + V_2O_5$ yields (3) m-chlorobenzoic acid (3:4392).

See 3:9504. Division C: Liquids with b.p. reported only at reduced pressure.

Hard cryst. with camphoraceous odor (3). [For crystallographic constants see (9).] [For prepn. from tetrachloroethylene (3:5460) (or pentachloroethane (3:5880) (2) (3)) + CHCl₃ (3:5050) by condensation in presence of AlCl₃ (88-93% yield (2), 85% yield (1) (10)) see (1) (2) (5) (7); from pentachloroacetone (3:6205) by htg. with PCl₅ in s.t. at 180° for 6-8 hrs. see (3); from dichloroacetyl chloride (3:5290) with AlCl₃ on warming (CO + CHCl₃ + HCl are also formed) see (11).]

Č has large mol. freezing-point lowering, viz., 120° (6). [For use in detn. of mol. wt. of org. compds. by f.p. lowering see (6).]

C on htg. especially in presence of catalysts such as ZnCl₂ yields HCl + hexachloropropene (3:6370); with CuCl a second reaction also occurs yielding HCl and tetrachloroethylene (3:5460). [For extensive study of these see (7) (8).]

 \bar{C} in alc. on titration with alk. gives (4) (3) an apparent Neut. Eq. of 285.5 because of loss of 1 HCl and formation of hexachloropropene (3:6370).

Cryst. from alc., AcOH or lgr. — Eas. sol. warm but less so cold alc., very eas. sol. ether, AcOH, C_6H_6 , CS_2 . — Sublimes at ord. temp. — At b.p. under ord. press. tends to decompose (7). — \bar{C} has agreeable arom. odor, but strongly attacks mucous membrane (2).

[For prepn. of \bar{C} from benzyl chloride (3:8535) with Cl_2 in pres. of I_2 (11) (8) (15) or $SbCl_5$ (16) see indic. refs.; from p-chlorotoluene (3:8287) with $SO_2Cl_2 + Bz_2O_2$ in dark (70% yield) (35), with Cl_2 in light (2) (17) (11) (5) (4) (18) (19) or with $PbCl_4.2NH_4Cl$ (9) see indic. refs.; from toluene with Cl_2 see (20); for prepn. of \bar{C} from chlorobenzene (3:7903) with $CH_2O + HCl$ (36), with bis-(chloromethyl) ether (3:5245) or chloromethyl methyl ether (3:7085) (formed by use of formaldehyde or paraformaldehyde + chlorosulfonic acid + conc. H_2SO_4 or hexamethylenetetramine + conc. HCl (3)) as directed (50% yield (3)) (1) see indic. refs.]

[Č with phenol in toluene yields (21) 2-(p-chlorobenzyl)phenol, m.p. 60-61°, and p-chlorobenzyl phenyl ether, m.p. 85.5-86.5°; Č with 2,4-dichlorophenol in toluene yields (21) 2-(p-chlorobenzyl)-4,6-dichlorophenol, m.p. 69.5-70.5°, and p-chlorobenzyl 2,4-dichlorophenol at the property of the property

phenyl ether, m.p. 64.5-65.5°.]

[Č with phenol + AlCl₃ yields (21) 4-(p-chlorobenzyl)phenol, m.p. 87-87.5° (benzoate, m.p. 115-116°); Č with 2,6-dichlorophenol + AlCl₃ yields (21) 4-(p-chlorobenzyl)-2,6-dichlorophenol, m.p. 61.5-62.5° (benzoate, m.p. 116-117°).]

[For condens. of \bar{C} with p-chlorophenol (3:0475) and use of prod. as anti-moth prepn. see (22); for condens. of \bar{C} with o-cresol (1:1400) or its Na salt or with 3,5-dimethylphenol (sym-m-xylenol)(1:1455) and use of products as bactericides see (23); for condens. of \bar{C} with sulfonated phenol and use as tanning agent see (24); for condens. of \bar{C} with resorcinol (1:1530) + AlCl₃ in nitrobenzene yielding 55% 4-(p-chlorobenzyl)resorcinol see (25),

Č with Mg in dry ether yields (10) p-Cl.C₆H₄.CH₂.MgCl which with phenyl isocyanate as directed (10) gives p-chlorophenylacetanilide [Beil. XII-275], lfts. from alc., m.p. 168° cor. (26), 165−166° u.c. (10), 164.5° (27).

 \bar{C} on boilg. with aq. (2) (3) hydrolyzes to p-chlorobenzyl alc. [Beil. VI-444], m.p. 70-71° (3) (for rate see (7)); \bar{C} on boilg. with Pb(NO₃)₂ for 2 days (28) or on boilg. in 60% alc. with hexamethylenetetramine (29) yields p-chlorobenzaldehyde (3:0765), m.p. 46-47° (3).

 $\ddot{\mathbf{C}}$ with alc. KOH yields (30) p-chlorobenzyl ethyl ether [Beil. VI-444, VI₁-(222)], oil, b.p. 225° (for study of rate of reactn. see (31)); $\ddot{\mathbf{C}}$ with KOAc in abs. alc. yields (28) p-chlorobenzyl acetate [Beil. VI-445], b.p. 240° (28); $\ddot{\mathbf{C}}$ with boilg. alc. KCN yields (11) (28) (20) p-chlorobenzyl cyanide [Beil. IX-448], m.p. 30° (20), b.p. 265-267° (20), which on hydrolysis yields p-chlorophenylacetic acid (3:3135), m.p. 105° (20).

 \bar{C} with KI in alc. gives alm. quant. yield (17) p-chlorobenzyl iodide, m.p. 64° (17) (for study of rate of reactn. of \bar{C} with NaI (34) or KI (14) (6) in acetone see indic. refs.); \bar{C} with Na₂SO₃ yields (18) (13) sodium p-chlorotoluene- ω -sulfonate (corresp. sulfonamide,

m.p. 157° (18), corresp. sulfonanilide, m.p. 235° (18)).

[\bar{C} with thiourea (1 mole) in alc. refluxed 30 min. gives (37) S-(p-chlorobenzyl)isothiourea hydrochloride (p-chlorobenzyl isothiuronium chloride), cryst. from 1:1 conc. HCl + aq., m.p. 197°; this prod. is useful in identification of organic acids (37).]

 \bar{C} on oxidn. with CrO₃ (11) (3) or with KMnO₄ (1) (12) yields p-chlorobenzoic acid (3:4940), m.p. 236°.

CHLOROBENZOTRICHLORIDE C7H4Cl4 Beil. V - 302 V_1 -(153) V_{2} -(234)

M.P. 30° **B.P. 260°**

Division B: Liquids, Section 1, $D_4^{20} > 1.15$. See 3:6880.

2,3-DICHLORODIOXANE-1,4 C₄H₆O₂Cl₂ Beil. S.N. 2668

M.P. 30° B.P. 100-101° at 24-25 mm.

See 3:9105. Division C: Liquids with b.p. only at reduced pressure.

3: 0235 α-CHLORO-ISOBUTYRIC ACID C₄H₇O₂Cl Beil. II-294 II1---II₂—

M.P. 31° (1) (2) B.P. 118° at 50 mm. (1) 28-30° (3) 116-118° at 50 mm. (4) 80-82° at 12 mm, (2)

Eas. sol. aq.

[For prepn. of C from isobutyric acid (1:1030) with Cl2 in light (5) (10) or with cat, as specified (6) (7), or with SO₂Cl₂ + dibenzoyl peroxide in CCl₄ (15% C + 85% β-chloro isomer) (3:9132) (3), see indic. refs.; from β,β,β -trichloro-ter-butyl alc. ("Chloretone") (3:2662) with aq. alk. (small yield together with other prods.) see (1) (2); from 2-chloro-2methylpropanol-1 (β-chloro-isobutyl alc.) (3:7305) by oxidn. with conc. HNO₃ see (8); from α -chloro-isobutyryl chloride (3:5385) by hydrolysis with ag. see (9),1

 \bar{C} with aq. alk. yields (5) α -hydroxy-isobutyric acid (1:0431) together with other products. — C with aq. Ca(OCl)₂ yields (4) chloroform (3:5050) + AcOH (1:1010) + CO₂. C with SOCl₂ (11) yields α-chloro-isobutyryl chloride (3:5385), b.p. 117-118°

- Methyl α -chloro-isobutyrate: b.p. 129° (see 3:7918).
- ---- Ethyl α -chloro-isobutyrate: b.p. 148° (see 3:8147).
- ---- α-Chloro-isobutyramide: unreported.
- D α -Chloro-isobutyr-anilide: m.p. 71–71.5° (3), 68° (12), 67–68° (13). [From α -chloro-isobutyryl chloride with aniline (3).] [Note that β -chloro-isobutyr-anilide has m.p. 109.0–109.5° (3).]
- \bigcirc α -Chloro-isobutyro-p-toluidide: unreported.

COOCH₃

$$H_{-C}$$
 H_{-C}
 H_{-C}
 H_{-C}
 H_{-C}
 H_{-C}

M.P. 31.5-32° (1)

[For prepn. of \check{C} from $meso-\alpha,\alpha'$ -dichlorosuccinic acid (3:4930) in MeOH with HCl gas see (1).]

[For studies on dipole moment see (2).]

3:0240 (1) Kirchhoff, Ann. 280, 215 (1894). (2) Hassel, Naeshagen, Tids. Kemi Bergvesen 10, 126-127 (1930); Cent. 1931, I 893; C.A. 25, 1493 (1931).

M.P. 32°

[For prepn. from p-xylene, chloroacetyl chloride (3:5235) + AlCl₃, see (1) (2).] \bar{C} on oxidn. with alk. KMnO₄ gives (2) trimellitic ac. (1:0551), m.p. 228°.

3:0245 (1) Kunckell, Ber. 30, 579 (1897). (2) Collet, Bull. soc. chim. (3) 17, 509 (1897).

[See also 2-(chloromethyl)naphthalene (3:0747).]

Colorless cryst. from alc. at -15° (9); \tilde{C} on distn. tends to dec. and even in vacuum must be distd. with care (11), since it readily changes to a chlorine-free solid melting around 200° (11). — \tilde{C} is a powerful skin irritant (15).

The prepn. of \bar{C} has been much studied in recent years because of its importance in prepn. of the important plant-growth stimulant α -naphthylacetic acid (1:0728).

[For prepn. of $\bar{\bf C}$ from naphthalene + paraformaldehyde (or trioxymethylene) in AcOH with conc. HCl + H₃PO₄ (yields: 70-72% (15), 56.5% (20), 54% (21), 45% (15) (13)) see indic. refs.; from naphthalene + paraformaldehyde (or trioxymethylene) in AcOH with dry HCl gas (yields: 73-95% (3), denied (15), 51.5% (19), 31.6% (20)) or in AcOH/H₃PO₄/conc. HCl (74-77% yield (44)) cf. (15) see indic. refs.; from naphthalene + paraformaldehyde (or trioxymethylene) + ZnCl₂ in pet. ether (yields: 42% (4), 36% (17), 11% (4)) see indic. refs.: for prepn. of $\bar{\bf C}$ from aq. formaldehyde soln. (formalin) with conc. HCl + HCl gas see (8) (7), or with replacement of the HCl gas by conc. H₂SO₄ (yields: 68-70% (11), 60-70% (24) cf. (46), 60% (22), 33% (23)) (6) (26); for prepn. of $\bar{\bf C}$ from naphthalene + chloromethyl ether (3:7085) (50% yield) see (10); from naphthalene + sym.-dichlorodimethyl ether (3:5245) + H₃PO₄ (or H₂SO₄) see (27); note that in prepn. of $\bar{\bf C}$ by the preceding methods other products are also formed, notably 1,5-bis-(chloromethyl)naphthalene, cf. (2) (13), colorless cryst. from C₆H₆, m.p. 144° (2), b.p. 175-185° at 12 mm. (2), and di-(α -naphthyl)methane [Beil. V-728, V₁-(360)], cryst. from alc., m.p. 108° (13).]

[For prepn. of \bar{C} from α -methylnaphthalene (1:7600) with Cl_2 see (9) (12) (14); from α -naphthylmethylcarbinol [Beil. VI-667, VI₁-(320)] with SOCl₂ in toluene (79% yield (18)) or with conc. HCl on htg. in s.t. (30% yield (1)) see indic. refs.; from N-benzoyl- α -naphthylmethylamine (1) or N-benzoyl- α -naphthylmet

C on oxidn. with Cu(NO₃)₂ or C with hexamethylenetetramine refluxed in alc. gives

(yields: 60% (4), 59-60% (11), 48% (6)) α-naphthaldehyde [Beil. VII-400, 955, VII₁-(212)], b.p. 291-292° (28), 158-159° at 14 mm. (6) (oxime, m.p. 98° (11) (28), phenylhydrazone, m.p. 82° (11), p-nitrophenylhydrazone, m.p. 237° (11), 2,4-dinitrophenylhydrazone, m.p. 254° (11), semicarbazone, m.p. 224° (4), 219° (11)).

[\bar{C} on cat. hydrogenation (10) or on reductn. with Zn in alc. + dry HCl gas at 0° (68% yield (4)) (15), or by hydrolysis of α -C₁₀H₇.CH₂MgCl (see below) (80% yield (15)), gives α -methylnaphthalene (1:7600); note that reductn. of \bar{C} with 4Na + alc. is incomplete (4).]

[Č with Mg in dry ether + trace I₂ + trace MeI under N₂ readily gives (88–92% yield (15)) (18) corresp. α-C₁₀H₇.CH₂MgCl. This RMgCl cpd. shows many of usual reactns.: e.g., with aq. it gives (80% yield (15)) α-methylnaphthalene (1:7600); on carbonation with CO₂ and subsequent acidification it gives (59.4% yield (18)) α-naphthylacetic acid (1:0728); with phenyl isocyanate it gives (36% yield (18)) (15) α-naphthylacetic anilide, m.p. 156–157° (15); with α-naphthyl isocyanate it gives (15) α-naphthylacetic α-naphthalide, cryst. from xylene, m.p. 175–177° (15); with HgCl₂ it gives (15) α-naphthylcarbinyl-mercuric-chloride, cryst. from 80% alc., m.p. 126–128° (15); with Me2SO₄ it gives (55.1% yield (18)) α-ethylnaphthalene; with ClNH₂ it gives (47% yield (45)) α-(aminomethyl)-naphthalene. However, in certain cases, the RMgCl cpd. shows abnormal reactns.: e.g., with formaldehyde gas it gives (18) α-methyl-β-naphthylcarbinol + 1,2-di-(α-naphthyl)-ethane; with ethyl chloroformate it gives (18) ethyl α-methyl-β-naphthoate; with acetyl chloride it gives (poor yield (22)) 1,3-di-α-naphthyl-2-methylpropene-1. (Note also that the closely related α-C₁₀H₇.CH₂.COOMgCl with C₂H₅MgBr or iso-C₃H₇MgCl yields (29) α-naphthylmalonic acid, m.p. 151° dec.)]

[\bar{C} with diethyl malonate + NaOEt in alc. gives (yields: 82% (19), 80% (8)) diethyl α -naphthylmethylmalonate which upon hydrolysis gives (99% yield (19)) α -naphthylmethylmalonic acid, and this on htg. at 175° loses CO₂ giving (92% yield (19)) β -(1-naphthyl)propionic acid, m.p. 156.0–156.6° cor. (19) (methyl ester, m.p. 36° (2)). — \bar{C} with diethyl methyl-malonate + NaOEt in abs. alc. gives similarly (70.5% yield (21)) diethyl methyl-(α -naphthylmethyl)malonate, and ultimately (73% yield (21)) β -(1-naphthyl)isobutyric acid, m.p. 91.8–92.6° (21).]

[\bar{C} with KCN in dil. EtOH (yields: 87% (31), 40% (14) (20) (26) (30) (46) or with NaCN in MeOH (yield 85% (2)) gives α -naphthylacetonitrile, b.p. 183–187° at 13 mm., m.p. 31–32° (31), which on hydrolysis with AcOH/H₂SO₄/aq. (20) (2) (31) cf. (32) (46) gives α -naphthylacetic acid (1:0728).]

[\bar{C} with KOAc in AcOH refluxed for 2 hrs. gives (2) α -naphthylcarbinyl acetate, b.p. 134-136° at 1.5 mm. (2), which on hydrol. with alc. KOH gives α -naphthylcarbinol (see above). — \bar{C} with aq. Na₂SO₃ + NaOH gives (4) sodium 1-naphthylmethanesulfonate. — For study of nitration of \bar{C} see (42) (43).]

[\overline{C} with paraformaldehyde + ZnCl₂ + dry HCl gas in pet. ether gives (57% yield (4)) 1,5-bis-(chloromethyl)naphthalene, m.p. 144° (see above).]

[For reactn. of \tilde{C} with 2-(chloromethyl)naphthalene (3:0747) see (33); for reactn. of \tilde{C} with β -methylnaphthalene (1:7605) + AlCl₃ in CS₂ see (33).]

[For reactn. of \bar{C} with xylene in prepn. of synthetic resins see (34); for reactn. of \bar{C} with 2,2'-dihydroxydiethyl sulfide ("thiodiglyccl") in prepn. of textile assts. see (35); for condens. of \bar{C} with 2-hydroxy-3-naphthoic acid derivs. in prepn. of prods. for animalization of vegetable fibers see (37).]

[\bar{C} with aq. at 100° for 1½ hrs. is 21.5% hydrolyzed (1). — \bar{C} with MeOH gives (87% yield (36)) (2) methyl α -naphthylmethyl ether, b.p. 134° at 11 mm. (36), 101–103° at 1.5 mm. (2); \bar{C} with EtOH + CaCO₃ gives ethyl α -naphthylmethyl ether, b.p. 144.5° at 11 mm. (36); other alcs. behave similarly (36). — For reactn. of \bar{C} with cresol in prepn. of synthetic resins see (38).]

[\bar{C} with liq. NH₃ as directed (39) gives 72% α -naphthylmethylamine (N-benzoyl deriv., lfts. from alc., m.p. 154° (1)) + 20% bis-(α -naphthylmethyl)amine (N-benzoyl deriv., pr. from alc., m.p. 134° (1)). — \bar{C} with alc. NH₃ as directed (39) gives 11% of the above prim. amine + 38% of the above sec. amine + 47% tris-(α -naphthylmethyl)amine, cryst. from alc., m.p. 178° (39). — Note the use of the above bis-(α -naphthylmethyl)amine as useful reagent for quant. pptn. of HNO₃ (6). — For reactn. of \bar{C} with (CH₃)₂NH see (1). — \bar{C} with aniline at 100° gives (77% yield (4)) N-(α -naphthylmethyl)aniline, m.p. 67° (4) (corresp. nitroso cpd., m.p. 57° (4)).]

[\bar{C} with thiourea in alc. as directed (40) yields $S-(\alpha-\text{naphthylmethyl})$ isothiourea hydrochloride, m.p. 238° (40). — \bar{C} with p-toluenesulfonamide + alc. KOH refluxed 12 hrs. gives (57% yield (6)) $N,N-bis-(\alpha-\text{naphthylmethyl})p$ -toluenesulfonamide, cryst. from boilg. alc., m.p. 134° (6).]

[C with various polynitrophenols gives addn. prods.: e.g., that from pieric acid has m.p. 80-82° (41), 84° (4); that from 2,4,6-trinitro-m-cresol has m.p. 81.5-82° (41); that from 2,4,6-trinitroresorcinol (styphnic acid) has m.p. 112.5-113° (41).]

① N-(α -Naphthylmethyl)phthalimide (α -phthalimido- α -methylnaphthalene): white ndls. from hot alc., m.p. 174-175° (6). [From \bar{C} + Na phthalimide refluxed 6 hrs. in alc. in 82% yield (6).] — [Hydrolysis of this prod. with 4 pts. conc. HCl in s.t. 2 hrs. at 100° gives (86% yield (6)) α -naphthylmethylamine (see above).]

3:0255 m-CHLOROPHENOL

M.P. 32.8° (1) B.P. 215.5-217.1° (7)
$$D_{-}^{50} = 1.237$$
 (9) $n_{D}^{40} = 1.5565$ (1) 32° (2) 216° (17) $D_{-}^{25} = 1.268$ (9) 31-32° (3) 213-216° (8) 31° (4) 214° (6) cor. (16) 28.5° (5) 211-212° u.c. (5) 28° (6) 98° at 12 mm. (2)

 \bar{C} has odor like phenol (for study of strength of odor in aq. soln. see (10)). — \bar{C} in pres. of aq. has unusual tendency to form supersatd. solns. (11) (for temp./compn. data on soly. of \bar{C} in aq. or in C_6H_6 see (11)). — \bar{C} eas. discolors in air.

[For prepn. of \bar{C} from *m*-chloroaniline [Beil. XII-602, XII₁-(300)] via diazotization and subsequent reaction with aq. (yields: alm. quant. {12} {13}, 67% {1}, 64% {8}, 55% {4}, 50% {14}) {15} {5} {16} see indic. refs. (note that the process is sensitive to conditions and refs. indic. give valuable information on its control); for formn. of \bar{C} from *m*-dichlorobenzene (3:5960) with NaOMe in MeOH in s.t. at 180° for 30 hrs. see (17).

 \bar{C} like its isomers is sol. in conc. Na₂CO₃ soln. at room temp. and is repptd. by CO₂ (18). [For studies of value of ionization const. of \bar{C} in aq. or dil. MeOH or dil. EtOH see (19) (20) (6) (21) (22).]

 $\tilde{\mathbf{C}}$ on fusion with KOH yields (23) resorcinol (1:1530). — [For condens. of $\tilde{\mathbf{C}}$ with phthalic anhydride to yield 3,6-dichlorofluorane ("fluorescein chloride") [Beil. XIX-147] (impt. intermed. in prepn. of rhodamine dyes) see (12) (68).]

[Č conv. to dry Na salt and treated with CO₂ under press. yields after acidifn. (14) 6-carboxy-3-chlorophenol (4-chloro-2-hydroxybenzoic acid) (4-chlorosalicylic acid) (3:4908), ndls. from aq., m.p. 207° (14).]

[\bar{C} in the Reimer-Tiemann reactn. with alk. (or better Ca(OH)₂ + Na₂CO₃ (24)) and chloroform (24) or bromoform (25) yields both 6-aldehydo-3-chlorophenol (4-chlorosalicylaldehyde) (3:0960) and 4-aldehydo-3-chlorophenol (3:4280) in o/p ratio of 0.71 with CHCl₃ (26) (25) and 0.84 with CHBr₃ (25).] — [The 4-aldehydo-3-chlorophenol has also been obtd. (50% yield) from \bar{C} in C₆H₆ with HCl + HCN + ACl₃ (29).]

 $[\bar{C}]$ in aq. Na₂CO₃ soln couples with 1 equiv. of benzenediazonium chloride yielding (27) (18) 3-chloro-4-phenylazophenol, or.-yel. ndls. from 25% AcOH, m.p. 95° (27), or, on expos. to HCl, or.-red, m.p. 114° (27) (18); \bar{C} in aq. NaOH with 2 equivs. of benzenediazonium chloride yields (27) 3-chloro-2,4-bis (phenylazo)phenol, dark red-brn., m.p. 181°; no tris-azo cpds. appear to be formed (27). — For study of coupling of \bar{C} with p-nitrobenzene-diazonium bisulfate see (28).

 $[\bar{C} \text{ is } not \text{ reduced by HI in AcOH (30); for study of replacement of Cl by H with H₂ + Ni cat. at room temp. see (31).]$

[$\bar{\mathbf{C}}$ with p-aminophenol oxidized in alk. soln. with NaOCl yields (32) indochlorophenol; $\bar{\mathbf{C}}$ with p-aminodimethylaniline on oxidn. with NaOCl as directed (8) yields 3-chloro-N,N-dimethylindoaniline.]

[For condensation of \bar{C} with formaldehyde (33) or with benzaldehyde-o-sulfonic acid (34) and use of product as mothproofing agents see indic. refs.; for reactn. of \bar{C} with unsatd. halides in pres. of alk. yielding m-chlorophenyl alkenyl ethers which by rearr. yield corresp. substituted phenols used as bactericides see (35) (36).]

[For condens. of \tilde{C} with malic acid $(1:0450) + \text{conc. } H_2SO_4$ giving small yield of 7-chlorocoumarin [Beil. XVII-331] see (37); with ethyl acetoacetate $(1:1710) + H_2SO_4$

giving small yield of 7-chloro-4-methylcoumarin [Beil. XVII-336] see (37); with ethyl methylacetoacetate $(1:1712) + P_2O_5$ yielding 7-chloro-2,3-dimethylchromone [Beil. XVII₁-(177)] see (38).]

 \bar{C} with 3 moles Br₂ (in aq. KBr) gives 100% yield (39) 2,4,6-tribromo-3-chlorophenol, ndls. from dil. alc., m.p. 105-106° cor. (39) (methyl ether, m.p. 96° (39)); \bar{C} in 10% aq. KOH with 4 moles I₂ (in aq. KI) gives 2,4,6-triiodo-3-chlorophenol, ndls. from boilg. AcOH, m.p. 139-140° (39).

[C in dil. NaOH mixed with aq. NaNO₂ and acidified as directed (40) gives (40% yield (40)) (43) 3-chloro-4-nitrosophenol, m.p. 133° (40), 129.6° (41); on soln. in Na₂CO₃ and subsequent acidification this cpd. yields (40) (43) the isomeric 3-chlorobenzoquinone-4-monoxime, m.p. 184° dec. (40), cf. (42).

[C on mononitration with H₂SO₄ + NaNO₃ as directed (44) or C in AcOH with fumg. HNO₃ at 0° (45) gives (yield: 32% (45), 22% (44)) 3-chloro-6-nitrophenol [Beil. VI-238], volatile with steam, m.p. 41° (44), together with (60% yield (44)) 3-chloro-4-nitrophenol [Beil. VI-240], not volatile with steam, white ndls. from dil. HCl or aq., m.p. 121-122° (44). — Note that the two other position isomers although known have been obtd. indirectly: 3-chloro-2-nitrophenol, anhydrous form, yel. cryst., m.p. 45-47° (46) (47); monohydrate, colorless cryst. from pet. ether, m.p. 37.5-38° (46) (47) (44); 3-chloro-5-nitrophenol [Beil. VI-239] (48), m.p. 147°.]

[C on dinitration as directed (44) (49) gives 3-chloro-4,6-dinitrophenol [Beil. VI-259, VI₁-(128)], colorless cryst. from aq. or lt. pet., m.p. 92-93° (44). — Note that two other position isomers are known but prepd. indirectly: 3-chloro-2,6-dinitrophenol, white cryst. from dil. HCl, m.p. 114.5° (44) (49); 3-chloro-2,4-dinitrophenol, cryst. from aq., m.p. 138-140° (44) (49).]

Č on trinitration by soln. in 1½ pts. fumg. H₂SO₄ (27% SO₃) and treated in cold for 1 hr. with 10 pts. 70% HNO₃ (44) cf. (4) (50) yields 3-chloro-2,4,6-trinitrophenol [Beil. VI-292], cryst. from aq. or dil. H₂SO₄, m.p. 114° (44), 116° (4), 119° (50). — [Note that if \bar{C} is sulfonated prior to trinitration the isomeric 3-chloro-2,5,6-trinitrophenol, m.p. 112.5−113.5° (44), is obtd. (44).]

[For studies on the sulfonation of \bar{C} see (44) (51) (52) (53).]

[\bar{C} in MeOH/KOH with MeI yields (29) m-chlorophenyl methyl ether (m-chloroanisole) (8:6195).] [\bar{C} in EtOH/KOH with EtI gives (18) 3-chlorophenyl ethyl ether (m-chlorophenetole) (3:6323), b.p. 204–205° at 717 mm., $D_4^{20} = 1.1712$ (18) (for rate of formn. from sodium salt of \bar{C} with EtI in alc. soln. see (55)).]

- —— m-Chlorophenyl acetate [Beil. VI-185]: oil, b.p. 116.5° at 21 mm. (18), 108° at 12 mm. (57), $84-86^{\circ}$ at 2 mm. (57), m.p. -1.5° to -0.5° (18), $D_4^{20} = 1.2209$ (18). [From \bar{C} with $Ac_2O + NaOAc$ (18) or indirectly from m-chloroaniline via diazotiazation, etc. (57).] [For rate of reactn. of \bar{C} with AcBr see (58).]
- m-Chlorophenyl benzoate [Beil. IX-117]: pr. from dil. alc. or dil. acetone, m.p. 71-72° (18). [From C in 10% aq. Na₂CO₃ with BzCl (18); for study of rate of benzoylation of C see (59).]
- m-Chlorophenyl m-nitrobenzoate: ndls. from alc. or dil. acetone, m.p. 94-95° (18). [From C in alk. with m-nitrobenzoyl chloride (18).]
- m-Chlorophenyl p-nitrobenzoate: m.p. 99°.
- m-Chlorophenyl 3,5-dinitrobenzoate: m.p. 156°.
- —— m-Chlorophenyl benzenesulfonate: unrecorded.
- ---- m-Chlorophenyl p-toluenesulfonate: unrecorded.
- —— m-Chlorophenyl benzyl ether: m.p. 59°. [From C + benzyl-phenyl-dimethyl-ammonium chloride (60).]
- —— m-Chlorophenyl p-nitrobenzyl ether: unrecorded.

- —— m-Chlorophenyl 2,4-dinitrophenyl ether: pale yel. ndls. from alc., m.p. 75° (61). [From C in alk. with alc. 2,4-dinitrochlorobenzene (61).]
- m-Chlorophenoxyacetic acid: cryst. from aq., m.p. 108-110° u.c. (62), Neut. Equiv. 186.5. [From Č in aq. NaOH with chloracetic acid (62).]
- ---- m-Chlorophenyl N-phenylcarbamate: unrecorded.
- m m-Chlorophenyl N-(p-bromophenyl)carbamate: ndls. from C_6H_6 + EtOAc, m.p. 121-123° cor. (64). [From \ddot{C} + p-bromobenzazide in lgr. (64).]
- 0 m-Chlorophenyl N-(p-iodophenyl)carbamate: m.p. 138-139° (69). [From $\ddot{\textbf{C}}$ with p-iodobenzazide in hot lgr. (69).]
- m-Chlorophenyl N-(m-nitrophenyl)carbamate: m.p. 115-116° u.c., 117-118° cor. (70). [From C with m-nitrophenyl isocyanate in lgr. (70).]
- m m-Chlorophenyl N-(p-nitrophenyl)carbamate: pale yel. pr. from lgr., m.p. 144° cor. (65). [From $\ddot{\mathbf{C}}$ + p-nitrobenzazide in lgr. (65).]
- m-Chlorophenyl N-(3,5-dinitro-4-methylphenyl)carbamate: or.-yel. pr. from lgr., m.p. 170-172° u.c., 174-176° cor. (63). [From C with 3,5-dinitro-4-methylbenzazide in lgr. (63).]
- \bigcirc m-Chlorophenyl N-(α -naphthyl)carbamate: cryst. from lgr., m.p. 157-158° (66). [From $\bar{C} + \alpha$ -naphthyl isocyanate in lgr. (66).]
- m-Chlorophenyl N-(β-naphthyl)carbamate: pr. from igr., m.p. 114-115° u.e., 116-117° cor. (67). [From C + β-naphthyl isocyanate (or azide) in lgr. (67).]
- ---- m-Chlorophenyl N,N-diphenylcarbamate: unreported.

[For prepn. (36.8% yield $\{7\}$) (together with other products) from biphenyl by direct chlorination in presence of Fe or other cat. see $\{7\}$ (2) (8) (9); for prepn. (25-38% yield (5)) from diazotized o-chloroaniline + C₆H₆ see $\{5\}$ (4); for prepn. (60% yield (15)) from diazotized o-aminobiphenyl via Cu₂Cl₂ method see $\{15\}$ (10).]

[\bar{C} with aq. 15-30% NaOH at 300-400° (16) in pres. of Cu (17), or \bar{C} with aq. Na₂ $\bar{C}O_3$ + Cu at 300° (12), or \bar{C} with aq. vapor over cat. at 525-560° (11), gives 2-hydroxybiphenyl (1:1440) (16) (17) (11) or its mixt. with 3-hydroxybiphenyl (1:1475) (12).]

[For reactn. of \tilde{C} with phthalic anhydride + AlCl₃ yielding o-[4-(2'-chlorophenyl)-benzoyl]benzoic acid, short rods from AcOH, m.p. 190° cor., see (13) (14).]

 \tilde{C} (12 g.) on mononitration at 40° with a mixt. of conc. HNO₃ (D=1.43) (10 g.) + conc. H₂SO₄ (15 g.) gives (25% yield (3)) (18) of 2-chloro-4'-nitrobiphenyl, cryst. from pet. ether, m.p. 74-75° (18), 73-74° (3) accompanied by (50% yield (3)) of 2-chloro-4',5'-dinitrobiphenyl (see next paragraph). [Note that only one other nitro-2-chlorobiphenyl isomer is known, viz., 2-chloro-2'-nitrobiphenyl, m.p. 71° (19), and this has been prepd. only by indirect means (19).]

 $\tilde{\mathbb{C}}$ on dinitration (see above) or 2-chloro-4'-nitrobiphenyl on further nitration with fumg. HNO₃ (D=1.5) at 100° for 5 min. gives (18) 2-chloro-4',5'-dinitrobiphenyl, cryst. from AcOH, m.p. 159-160° (18), 158-159° (3) (formerly erroneously regarded (3) as the 2-chloro-3',4'-dinitro isomer). [Note that two other isomeric dinitro-2-chlorobiphenyls are known, viz., 2-chloro-4,4'-dinitrobiphenyl, m.p. 153-154° (18), and 2-chloro-3,5-dinitrobiphenyl, m.p. 115-116° (20), 119° (21), but both have been obtd. only by indirect means.] [$\tilde{\mathbb{C}}$ with Mg in evacuated hard-glass tube at 200-215° for 6 hrs. gives (32% yield (15)) o-xenyl MgCl.]

C on oxidn. with CrO₃ + AcOH yields (2) o-chlorobenzoic acid (3:4150), m.p. 141°.

White cryst., sol. in CCl₄ and in pet. eth. — Note that the name cinnamoyl chloride avoids confusion with cinnamyl chloride, C₆H₅.CH=CH.CH₂Cl (3:0010).

[For prepn. of \bar{C} from cinnamic acid (1:0735) with PCl₅ (86% yield (17)) (9) (18), with PCl₃ (19) (15) (6), with PCl₃ + ZnCl₂ (86% yield (17)), with SOCl₂ alone (yields: 98% (17), 90–95% (13), 89% (11)) (62) (1) (2) (16) or in CCl₄ (80% yield (3)), with COCl₂ (3:5000) in pres. of tertiary bases (20), with p-toluenesulfonyl chloride in pyridine or diethylaniline (21), see indic. refs.; from sodium salt of cinnamic acid (1:0735) with oxalyl (di)chloride (3:5060) in C₆H₆ (75–90% yield) see (22).]

[\bar{C} in CCl₄ with Cl₂ in dark gives (5) an oily prod. which with aq. hydrolyzes to a mixt. of cinnamic acid dichloride [Beil. IX-514, IX₁-(200)], m.p. 167°, and allocinnamic acid dichloride [Beil. IX-514], m.p. 84°; \bar{C} in CCl₄ with Cl₂ in direct sunlight, however, yields (5) α,β -dichloro- β -phenylpropionyl chloride (the acid chloride of cinnamic acid dichloride), ndls. from pet. eth., m.p. 54-55° (5), 55° (23).]

[Č is not reduced by copper hydride (24) but on cat. hydrogenation as directed (25) (26) yields cinnamaldehyde (1:0245).] [Č with KCN + quinoline gives (34% yield (57)) 1-cinnamoyl-2-cyano-1,2-dihydroquiroline which on acid hydrolysis yields 30% cinnamaldehyde (1:0245).]

[\bar{C} with 5% H_2O_2 in acetone + pyridine yields (27) di-cinnamoyl peroxide, m.p. 144° (27).]

[C with anhydrous neutral K oxalate (28), or with dil. aq. KOH + methylaniline or dimethylaniline (29) or with pyridine (30), or with excess $K_2S_2O_5$ in pyridine (31), or with Na cinnamate (6), yields cinnamic anhydride [Beil. IX-586, IX₁-(232)], ndls. from C_6H_5 or alc., m.p. 136° (30).] — [\bar{C} with aq. under certain conditions yields cinnamic anhydride + HCl (for use in micro detn. of aq. (2), or indirectly for micro detn. of O_2 (after combustion), see (4) (32)).]

[For reactn. of \bar{C} with diethyl malonate (1 mole) + Na (2 moles) see (33); for reactn. of \bar{C} with ethyl sodio-acetoacetate giving (60% yield (10)) (34) ethyl α -cinnamoylacetoacetate, m.p. 44° (10) (Cu enolate, m.p. 164° (10)), with methyl sodio-acetoacetate giving (35) methyl α -cinnamoylacetoacetate, m.p. 49-50° (35), with ethyl sodio-benzoylacetate giving (10) ethyl cinnamoyl-benzoyl-acetate (Cu enolate, m.p. 202° (10)), or with sodio-benzoylacetone giving (36) benzoyl-cinnamoyl-methane, m.p. 111° u.c. (36), see indic. refs.]

[\bar{C} with $C_6H_6+AlCl_3$ in CS_2 gives (37) (38) (39) (41) (by combined ring closure and addition to the unsatd. linkage or vice versa) 3-phenylhydrindone-1 (3-phenylindanone-1) [Beil. VII-483, VII₁-(265)], cryst. from MeOH, m.p. 78° (37), 77-78° (39) (oxime, m.p. 141° (40), phenylhydrazone, m.p. 130° (40), p-nitrophenylhydrazone, m.p. 220-221° (39), semicarbazone, m.p. 223-225° (39)), accompanied by β , β -diphenyl-propiophenone (1,3,3-triphenylpropanone-1 [Beil. VII-524, VII₁-(293)] (38) and other prods.: note that under similar conds. (41) with toluene or o-xylene neither of the corresp. indanones is formed (see also below); however, \bar{C} + m-xylene + AlCl₃ in CS_2 yields (41) 5,7-dimethyl-3-phenylindanone-1, m.p. 101° (semicarbazone, m.p. 195-197° (41)), and \bar{C} + p-xylene + AlCl₃ in CS_2 yields (41) 4,7-dimethyl-3-phenylindanone-1, m.p. 94-95° (oxime, m.p. 218-219°; phenylhydrazone, m.p. 193-194°; semicarbazone, m.p. 232° (41)).]

[\bar{C} with many arom. cpds. in pres. of AlCl₃ condenses with loss of HCl to yield corresp. benzalacetophenone (chalcone) derivs.: \bar{C} with C_6H_6 + AlCl₃, however, gives no (41) chalcone (see above); \bar{C} with toluene + AlCl₃ yields (41) 4'-methylchalcone, m.p. 76° (41); \bar{C} with o-xylene + AlCl₃ in CS₂ gives (63% yield (41)) 3',4'-dimethylchalcone, m.p. 72-73° (41); \bar{C} with m-xylene + AlCl₃ in CS₂ yields (41) 2',4'-dimethylchalcone, oil, b.p. 218-219° at 11 mm. (41); \bar{C} with biphenyl + AlCl₃ in CS₂ gives (78% yield (45)) (11) 4'-phenylchalcone, m.p. 155-156° (45), 165° (11).]

[Similar chalcone formation occurs with many arom. ethers; e.g., \bar{C} with anisole + AlCl₃ in CS₂ gives (42) 4'-methoxychalcone [Beil. VIII-193, VIII₁-(580)], m.p. 106-107° (42); \bar{C} similarly with phenetole gives (42) 4'-ethoxychalcone [Beil. VIII-193], m.p. 74-75° (42); \bar{C} similarly with methyl p-tolyl ether gives (43) not only 2'-methoxy-5'-methylchalcone, m.p. 55-56°, but also by demethylation 2'-hydroxy-5'-methylchalcone, m.p. 111° (43); \bar{C} similarly with methyl 3,4-dimethylphenyl ether yields (13) 4',5'-dimethyl-2'-methoxychalcone, m.p. 78° (13); \bar{C} similarly with methyl β -naphthyl ether yields (44) β -methoxynaphthochalcone, m.p. 138-140° (44); \bar{C} similarly with diphenyl ether yields (37) 4'-phenoxychalcone, m.p. 85° (37); for extension of this reactn. to ethers of polyhydric phenols such as \bar{C} + AlCl₃ + catechol dimethyl ether (veratrole) (1:7560) (44), resorcinol dimethyl ether (1:7570) (13), resorcinol diethyl ether (1:7585) (13) (43), hydroquinone diethyl ether (1:7185) (43), and pyrogallol trimethyl ether (1:7145) (44) see indic. refs.]

[Similar formation of substituted chalcones occurs with $\bar{C} + AlCl_3 + phenols$; e.g., for cases of \bar{C} with o-cresol (1:1400) (46), resorcinol (1:1530) (47), phloroglucinol (1:1620) (47) cf. (48) see indic. refs.]

[\bar{C} with diazomethane in ether gives (49) (50) (note both replacement of Cl and addn. to unsatd. linkage) 5-(diazoacetyl)-4-phenylpyrazoline, cryst. from C_6H_6 + pet. eth.; m.p. 80-81° (49), 77-78° (50).]

 $[\bar{C} + \text{NaN}_3]$ in ether gives (12% yield (51)) (52) cinnamoyl azide, cryst. from lgr., m.p. 86° dec. (51) (52); this cpd. on htg. above m.p. or preferably in C_6H_6 readily loses N_2 and rearr. giving (77% yield (53)) (51) (52) styryl isocyanate, b.p. 107° at 12 mm.; this isocyanate (or even its azide precursor) with aq. at 50° yields (51) N_iN' -distyrylurea, m.p. 213–214° (51); for its reactn. with MeOH yielding (52) methyl N-styrylcarbamate, m.p. 126°, with EtOH yielding (52) ethyl N-styrylcarbamate, m.p. 87°, with ammonia gas in dry ether yielding (51) N-styrylurea, m.p. 143°, or with aniline yielding (52) N-phenyl-N-styrylurea, m.p. 217°, see indic. refs.]

[\bar{C} with free NH₂OH in C₆H₆ gives (100% yield (16)) cinnamoylhydroxamic acid, cryst. from hot EtOAc by addn. of lgr., m.p. 119.5° (16), 111.5° (54).]

[\bar{C} htd. with urea at 70° gives (44% yield (55)) (56) N-cinnamoylurea, m.p. 208–209° (55), 197° (56).]

[For reactn. of \bar{C} with C_6H_5MgBr see (58); for reactn. of \bar{C} with cellulose see (59); for reactn. with o-aminothiophenol yielding 1-styrylbenzothiazole see (60); for reactn. of \bar{C}

with m-aminobenzoic acid and ring closure of intermediate m-(cinnamoylamino)benzoic acid to 1-(N),9-pyridanthrone-2', m.p. 408°, see (61).]

[C with MeOH yields methyl cinnamate (1:2090), m.p. 36°; C with EtOH yields ethyl cinnamate (1:4206), b.p. 271°; C with phenol (1:1420) gives (63-75% yield (62)) phenyl cinnamate, cryst. from 95% alc., m.p. 75-76° (62).]

 $\bar{\mathbf{C}}$ on hydrolysis yields cinnamic acid (1:0735), m.p. 133°; for the amide, anilide, p-toluidide, and other derivs. corresp. to $\bar{\mathbf{C}}$ see cinnamic acid (1:0735). [For reaction of $\bar{\mathbf{C}}$ with piperidine giving 93% yield cinnamopiperidide, m.p. 122°, or with morpholine giving 99% yield cinnamomorpholide, m.p. 94°, see (63).]

3: 0340 p-CHLOROPHENYL ETHYL KETONE C₉H₉OCl Beil. VII - 301 (4-Chloropropiophenone) Cl CO.CH₂.CH₃

Insol. aq.; sol. alc., ether, CS₂, and most org. solv. — Cryst. from abs. alc. at -15° (1). [For prepn. from propionyl chloride (3:7170) (2) (81% yield (4)) or propionic anhydride (1:1100) (1) + chlorobenzene + AlCl₃ see (1) (2) (4); for prepn. from p-chloro- α -methoxystyrene (68% yield (3)) by htg. in s.t. 2 hrs. at 300° see (3).

 $\bar{\mathbb{C}}$ on treatment with *n*-butyl nitrite + dry HCl gas in ether (1) (4) gives (83% yield (4)) 4-chloro-isonitrosopropiophenone, ndls. from dil. alc., m.p. 122-123° (4); 114° (1). $[\bar{\mathbb{C}} + \text{NaOEt}]$ in abs. alc. + *n*-butyl nitrite yields (1) only *p*-chlorobenzoic acid (3:4940), m.p. 243° (1).]

- D p-Chloropropiophenone oxime: from $\ddot{\textbf{C}}$ + hot alc. NH₂OH soln. (2); lfts., m.p. 62-62.5° (2).
- D p-Chloropropiophenone semicarbazone: ndls., m.p. 175-176° (3).

3:0340 (1) Edkins, Linnell, Quart. J. Pharm. Pharmacol. 9, 203-229 (1936); Cent. 1937, I 4781; C.A. 30, 6724 (1936). (2) Collet, Compt. rend. 126, 1577 (1898). (3) Lauer, Spielman, J. Am. Chem. Soc. 55, 4928 (1933). (4) Hartung, Munch, Crossley, J. Am. Chem. Soc. 57, 1091 (1935).

3: 0350 3,5-DICHLOROBENZYL CHLORIDE $C_7H_5Cl_3$ Beil. S.N. 466 Cl — CH_2Cl

M.P. 36° (1)

Cryst. from MeOH (1); note that $\tilde{\mathbf{C}}$ has same m.p. as 3,5-dichlorobenzal dichloride (3:0370), but the m.p. of a mixture of the two is depressed (1).

[For prepn. of C from 3,5-dichlorobenzyl alc. with PCl₅ (91% yield) see (1).]

3:0350 (1) Asinger, Lock, Monatsh. 62, 347 (1933).

3: 0360 3,5-DICHLOROBIPHENYL Cl $C_{12}H_8Cl_2$ Beil. V $V_1-V_{2^-}$ (484)

M.P. 36° (1) B.P. 180° at 15 mm. (2) 166° at 10 mm. (1)

[For prepn. from 5-phenyl-4,5-dihydroresorcinol [Beil. VII-706] by conversion with PCl_5 in CHCl₃ to 3,5-dichloro-1-phenylcyclohexadiene-2,4, colorless oil, b.p. 156° at 10 mm. (1), which in CHCl₃ on treatment with Cl₂ first adds 2Cl₂, then splits off 2HCl to yield \tilde{C} , see (1); for prepn. from 3,5-dichloro-2-aminobiphenyl via replacement of $-NH_2$ by -H via diazo reactn. see (2)

 \bar{C} (5 g.) in AcOH (12 ml.) on nitration with mixt. (50 ml.) of equal vols. fumg. HNO₃ + AcOH yields (1) mainly 3,5-dichloro-4'-nitrobiphenyl, pale yel. ndls. from alc., m.p. 146° (1), accompanied by a smaller amt. of 3,5-dichloro-2'-nitrobiphenyl, ndls., m.p. 75° (1).

 \tilde{C} on oxidn, with CrO_3 + AcOH yields (1) (2) 3,5-dichlorobenzoic acid (3:4840), m.p. 183° (1), 188° (2).

3:0360 (1) Hinkel, Hey, J. Chem. Soc. 1928, 2786-2791, (2) Scarborough, Waters, J. Chem. Soc. 1927, 93.

M.P. 36.5° (1)

Colorless cryst, from MeOH or from dil, AcOH; eas, sol, usual org, solv. [Note that C has same m.p. as the closely related 3,5-dichlorobenzyl chloride (3:0350) but that a mixture of the two becomes liquid.

[For prepn. of C from 3,5-dichlorobenzaldehyde (3:1475) with PCl₅ (80% yield) see (1).1

 \bar{C} on hydrolysis with fumg. H_2SO_4 as directed gives (71-80% yield (1)) 3,5-dichlorobenzaldehyde (3:1475) (for study of rate of hydrol. in 50% alc. at 83.5° see (2)).

3:0370 (1) Asinger, Lock, Monatsh. 62, 347 (1933). (2) Asinger, Lock, Monatsh. 62, 337-338 (1933).

3: 0372 2,4,6-TRIMETHYLBENZYL CHLORIDE
$$C_{10}H_{13}Cl$$
 Beil. S.N. 469 $(\alpha^2$ -Chloroisodurene) CH_3 CH_2Cl

114-115° at 10 mm. (3)

[See also the isomeric 2,4,5-trimethylbenzyl chloride (3:9702).]

Colorless cryst. from alc. (4). — C blisters skin (3). — [Equiv. conductance of C in liq. SO₂ is 10 times that of benzyl chloride (3:8535) (3) cf. (5).]

PREPARATION OF C

[For prepn. of C from 1,3,5-trimethylbenzene (mesitylene) (1:7455) with formalin $(1:0145) + \text{conc. HCl} + \text{HCl gas at } 55^{\circ} \text{ for } 5\frac{1}{2} \text{ hrs. (yields: } 55-61\% \text{ (1), } 29\% \text{ (3)) (some)}$ α^2 , α^4 -dichloropentamethylbenzene = bis-1,3-(chloromethyl)2,4,6-trimethylbenzene, cryst. from pet. eth., m.p. 105° (1) (3), is also formed) see indic. refs.]

[For prepn. of C from mesitylene (1:7455) with chloromethyl methyl ether (3:7085) + SnCl₄ (yields: 60% (4) cf. (6)), or in AcOH without other cat. (yields: 80-85% (7), 80% (2)), or with chloromethyl ethyl ether (3:7195) + SnCl₄ in CCl₄ soln. at -5° (70% yield (8)), see indic. refs.]

CHEMICAL BEHAVIOR OF C

Reduction. [\overline{C} with H_2 + Pt cat. in alc. soln. gives (80% yield (2) cf. (7)) 1,2,3,5tetramethylbenzene (isodurene) [Beil. V-430, V₂-(329)] (9), liquid, b.p. 195-197° at 760 mm., f.p. -24° , $D_4^{20} = 0.8906$.]

Hydrolysis. C on hydrolysis (no details (2)) gives 2,4,6-trimethylbenzyl alc. (mesitylcarbinol), ndls. from alc., m.p. 89° (2), 88-89° (10) (3) (11), 87° (12) (corresp. N-phenylcarbamate, m.p. 124-125° (11)).

Conversion to ethers. [C with MeOH/KOH at 100° for 3 hrs. gives (79% yield (3)) methyl 2,4,6-trimethylbenzyl ether, oil, b.p. 109-110° at 15 mm. (3); C with EtOH/KOH similarly gives (77% yield (3)) ethyl 2,4,6-trimethylbenzyl ether, oil, b.p. 114-115° at 14 mm. (3).]

Conversion to esters. [C with AgOAc in AcOH at 100° for 3 hrs. gives (70% yield (3)) 2,4,6-trimethylbenzyl acetate, oil, b.p. 136-137° at 15 mm. (3); this ester on hydrolysis with 15% aq. KOH at 100° for 3 hrs. gives (91% yield (3)) 2,4,6-trimethylbenzyl alc., m.p. 88-89°. (See also above.)]

Conversion to nitrile. \bar{C} in alc. with aq. NaCN (1) (13) or KCN (4) (8), or C with CuCN in pyridine (14) cf. (1), gives (yields: almost 100% (13), 89-93% (1)) mesitylacetonitrile, cryst. from pet. eth., m.p. 79-80° (1), 79° (4); b.p. 160-165° at 22 mm. (13), 150-155° at 15 mm. (4), 190° at 11 mm. (8); this nitrile on hydrolysis with abt. 50% H₂SO₄ under reflux for 6 hrs. gives (87% yield (1)) mesitylacetic acid [Beil. IX-563, IX₁-(219)], cryst. from dil. alc. or lgr., m.p. 167-168° (1) (note that partial hydrolysis may give mesitylacetamide, m.p. 216° (8)).

BEHAVIOR OF C WITH ORGANOMETALLIC COMPOUNDS

With MeMgI. [C with MeMgI in dry ether undergoes mainly a coupling reaction giving (86% yield (15)) 1,2-dimesitylethane, m.p. 117.0-117.5°, accompanied by a little ethylmesitylene (1-ethyl-2,4,6-trimethylbenzene), b.p. 212-214° (15), 210° at 725 mm. (16), $D_{20}^{20} = 0.894$ (16), $n_{1}^{20} = 1.5074$ (16) (corresp. dinitro deriv., m.p. 111° (17), 109-111° (17) (15)).]

With misc. reactants. [\bar{C} with diethyl sodiomalonate gives (4) diethyl α -(2,4,6-trimethylbenzyl)malonate, m.p. 36°, b.p. 195–197° at 15 mm. (4). — \bar{C} with ethyl sodiobenzoylacetate gives (21% yield (18)) ethyl α -(2,4,6-trimethylbenzyl)benzoylacetate which upon alk. hydrolysis gives (45% yield (18)) the ketone 1-benzoyl-2-mesitylethane, ndls. from MeOH, m.p. 85.0–85.5° (18).]

OTHER REACTIONS OF C

[C (1 mole) with hexamethylenediamine (1 mole) in CHCl₃ refluxed 3 hrs. gives (96% yield (19)) corresp. quaternary salt, C.C₆H₁₂N₄: this prod. in aq. refluxed 4 hrs. does not give the expected mesitaldehyde but instead (75% yield (19)) di-(2,4,6-trimethylbenzylamino)methane, cryst. from alc., m.p. 151.5-152° (19).

N-(2,4,6-Trimethylbenzyl)phthalimide: ndls. from alc., m.p. 209.5-210° (19). [From C with K phthalimide at 170-180° for 4 hrs. as directed (19) (63% yield (19)).]

64

3:0375 14-CHLOROTETRADECANOL-1

C₁₄H₂₉OCl Beil. S.N. 24

 $(\omega$ -Chloro-n-tetradecyl

CH2.(CH2)12.CH2OH alcohol; ω-chloromyristyl alcohol)

M.P. 37-38° (1) B.P. 156-160° at 4 mm. (1)

Colorless cryst.

[For prepn. of \bar{C} from α, ω -tetradecamethylene glycol [Beil. I₂-(564)] (m.p. 85°) with SOCl₂ + dimethylaniline in C₆H₆ (43% yield) or by htg. with conc. HCl (32% yield) see (1); note that by the first method a little 1,14-dichlorotetradecane, cryst. from MeOH, m.p. 40°, is also formed.]

14-Chlorotetradecyl N-phenylcarbamate: lfts. from lt. pet., m.p. 68° (1).

3:0375 (1) Bennett, Gudgeon, J. Chem. Soc. 1938, 1679-1681.

3:0380 2,4,6-TRICHLOROTOLUENE

M.P. 38° (1) 34° (7) 33-34° (2)(3)31.9-32° (4)

Colorless ndls. from alc. (2); eas. volatile with steam (2).

[For prepn. of C from 2,4,6-trichloro-3-aminotoluene [Beil. XII-873] via diazotization and reaction with alc. see (2) (1) (4) (7); from 6-chloro-2,4-diaminotoluene via tetrazotization and use of Cu₂Cl₂ reaction see (3).] .

[C with Cl₂ in pres. of Al/Hg yields (5) 2,3,4,6-tetrachlorotoluene (3:2480), m.p. 89° (5), but \bar{C} with Cl_2 at 200° gives (82% yield (7)) 2,4,6-trichlorobenzal dichloride (3:0142).]

C on mononitration with cold fumg. HNO3 yields (2) (1) (6) 2,4,6-trichloro-3-nitrotoluene [Beil. V-333], ndls. from AcOH + EtOH (2) or dil. AcOH (6), m.p. 54° (2) (6), 50° (1); Č on dinitration (2) yields 2,4,6-trichloro-3,5-dinitrotoluene, cryst. from AcOH, m.p. 178-180° (2).

C on oxidn. with dil. HNO₃ readily yields (2) 2,4,6-trichlorobenzoic acid (3:4545), m.p. 160-161° (2).

3:0380 (1) Bureš, Trpišovska, Časopis Českoslov. Lékárnictva 15, 179-186 (1935); Čent. 1936, I 1209; C.A. 30, 1753 (1936). (2) Cohen, Dakin, J. Chem. Soc. 81, 1335-1336 (1902). (3) Morgan, Drew, J. 3: 0395 $d,l-\alpha,\alpha'$ -DICHLOROSUCCINYL (DI)CHLORIDE

, CO—Cl
$$C_4H_2O_2Cl_4$$
 Beil. II — II_1 — II_2 —(558) Cl — Cl — Cl — Cl

M.P. 39° (1) B.P. 78.5° at 7 mm. (1)

[For prepn. of \bar{C} from $d_i l - \alpha_i \alpha'$ -dichlorosuccinic acid (3:4711) with PCl₅ (2 moles) (yield 100%) see (1).]

 $\ddot{\mathbf{C}}$ on hydrolysis yields (1) $d_{l}\mathbf{l}$ - $\alpha_{l}\alpha'$ -dichlorosuccinic acid (3:4711).

[Č with C_6H_6 + AlCl₃ gives (66% yield (1)) solely d,l-1,2-dichloro-1,2-dibenzoylethane (d,l-2,3-dichloro-1,4-diphenylbutandione-1,4), m.p. 86° (2) (3).]

3:0395 (1) Lutz, J. Am. Chem. Soc. 49, 1110 (1927). (2) Conant, Lutz, J. Am. Chem. Soc. 47, 886 (1925). (3) Lutz, J. Am. Chem. Soc. 48, 2908, 2911 (1926).

Ndls. from hot conc. lgr.; spar. sol. aq.; eas. sol. alc., ether, AcOH. — C forms a monohydrate, C.H₂O, m.p. 42° (4) (1). — [For crystallographic data see (2).]

[For prepn. of \mathbb{C} from p-cresol (1:1410) with Cl_2 (1) in CCl_4 (7) (6) or in aq. NaOH (8), or with $\operatorname{SO}_2\operatorname{Cl}_2$ (2 moles) (9), see indic. refs.; from 4-methylphenoldisulfonic acid-2,6 [Beil. XI-261, XI₁-(62)] with Cl_2 in aq. soln. see (3); from 1,2,3,3,5,5,6-heptachloro-1-methylcyclohexanone-4 [Beil. VII-19] by reduction with SnCl_2 (poor yield (7)) or from 3,5-dichloro-1-methyl-1-dichloromethylcyclohexadien-2,5-one-4 [Beil. VII₁-(99)] by reduction with $\operatorname{Zn} + \operatorname{AcOH}$ (4) see indic. refs.; from ethyl 2,6-dichloro-4-methylphenyl ether by cleavage with conc. HCl see (5) although identity of prod. is doubtful.]

[\bar{C} with dry NH₃ gas forms at room temp. a mol. cpd. $\bar{C}.NH_3$; at -15° a mol. cpd. $\bar{C}.2NH_3$ (10); \bar{C} with alc. NH₃ htd. in s.t. short time at 100° gives (1) an NH₄ salt, $C_7H_5Cl_2-ONH_4$, colorless ndls, m.p. 125°, which sublime unchanged and from whose aq. soln. acidification reppts. \bar{C} (1) (dif. from 4,6-dichloro-2-methylphenol (3:1020) q.v.)] — [\bar{C} also yields a yellow silver salt (11) (12) which in light rapidly turns green and decomposes (11) (12).]

[C in AcOH with conc. HNO₃ in cold gives (yield: 92% (6), 82% (7)) 2,6-dichloro-4-methyl-quinitrol, alm. colorless ndls., m.p. 74-76° (6) (7), 80-82° if taken in warm bath (6) (for study of reactions of this prod. with McOH and with EtOH see (13)).]

[\bar{C} with warm dil. HNO₃ (D=1.1) readily oxidizes yielding (1) as the only solid product oxalic acid (1:0445); \bar{C} on oxidn. with CrO₃ in AcOH yields (1) an acid, C₇H₄O₃Cl₂, m.p. 156° u.c., which, however, is *not* the expected 3,5-dichloro-4-hydroxybenzoic acid, m.p. 255-256°.]

[\bar{C} on monosulfonation with fumg. H_2SO_4 (65% SO_3) at 50° yields (14) 2,6-dichloro-4-methylphenolsulfonic acid-3.]

[$\bar{\mathbf{C}}$ in MeOH/KOH with MeI refluxed 5 hrs. gives (15) 2,6-dichloro-4-methylphenyl methyl ether, b.p. 234° (15), which on oxidn with dil. HNO₃ (D=1 15) by refluxing for 50 hrs. yields (15) 2,6-dichloro-4-methoxybenzoic acid, m.p. 200-201° (15); the ethyl ether of $\bar{\mathbf{C}}$ is an oil, b.p. 147-154° at 16 mm., and has been reported by indirect means (5).]

- 2.6-Dichloro-4-methylphenyl acetate: lfts. from dil. AcOH, m.p. 48° (7).
- 2,6-Dichloro-4-methylphenyl benzoate: tbls. from dil. alc., m.p. 91° (7) (4). [From C on htg. with benzoic anhydride (1:0595) (7).]

3:0410 2,6-DICHLOROBENZYL CHLORIDE

C7H5Cl3 Beil. S.N. 466

$$C_{\rm Cl}$$
 CH₂Cl

M.P. 39-40° (1)

Colorless cryst. from lgr., ether, or alc. + ether.

[For prepn. of C from 2,6-dichlorotoluene (3:6270) by treatment at b.p. with Cl₂ in u.v. light see (1).]

C with Mg in dry ether gives 90% yield 2,6-dichlorobenzyl MgCl; this prod. upon treatment with CO₂ (1) or with methyl chloroformate (3:5075) followed by appropriate treatment yields 2,6-dichlorophenylacetic acid, cryst. from alc., m.p. 157-158° (1).

3:0410 (1) Austin, Johnson, J. Am. Chem. Soc. 54, 658-659 (1932).

3:0422 OCTACHLOROCYCLOPENTENE

Beil. V - 62 **V**1---

M.P.		B.P.				
41°	(1) (8)	283-284°	at 733 mm.	(5) (6)	$D_4^{50} = 1.817 (4)$	$n_{\rm D}^{50}=1.5660~(4)$
40-4	1° (7)	283°		(1)		
40°	(2)	183°	at 20 mm.	(2)		
39°	(3)	140°	at 10 mm.	(4)		
38°	(4)					
32°	(10)					

[See also hexachlorobutadiene-1,3 (3:6425).]

Colorless cryst. from 95% alc. (4) or EtOH contg. 5% tetrachloroethylene (3:5460) (3). [For prepn. of C from pentachlorocyclopentenone [Beil. VII-49] (7), from either the higher- or lower-melting stereoisomer of hexachlorocyclopentenone [Beil. VII-49] (1). from dibromo-dichloro-cyclopentanetrione [Beil. VII-853] (8), or from xanthogallol (tetrabromocyclopentenedione [Beil. VII₁-(321)] (2), all with PCl₅ in s.t., at elevated temps, as directed, see indic. refs.]

[For formn. from nonachloropentene-1 (itself obtd. from hexachloropropene (3:6370) with trichloroethylene (3:5170) + AlCl₃ (9)) by elimination of 1 HCl with alc. KOH yielding octachloropentadiene-1,3 followed by rearr. to C by boilg. with AlCl3 see (3).1

[For formn. of C (together with CCl₄ (3:5100) and hexachloroethane (3:4835) by highpress./high-temp. chlorination of chloropentanes see (4); by exhaustive chlorination of hexyl iodide, heptaldehyde, heptylic acid, etc. (5), of high-mol.-wt. hydrocarbons (6), or of 3-chloro-5,6-dihydroxy-2-(dichloromethyl)pyridine [Beil. XII-164] (10), see indic. refs.]

Note that C, formerly regarded as hexachlorobutadiene-1,3 (3:6425), is currently (3) believed to have the structure octachlorocyclopentene; for Raman spectra evidence see (11). 3:0422 (1) Zincke, Küster, Ber. 23, 2214-2215 (1890). 3: 0425 2,3,4-TRICHLOROTOLUENE

$$\begin{array}{cccc} {\rm CH_3} & {\rm C_7H_5Cl_3} & & \text{Beil. V - 298} \\ & & & \text{V_1--} \\ & & & \text{V_2-(232)} \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ \end{array}$$

C₅H₉O₂Cl

Beil. S.N. 162

Ndls. from MeOH or EtOH; volatile with steam.

[For prepn. of \bar{C} from 2,3-dichloro-4-aminotoluene [Beil. XII-990] via diazotization and use of Cu_2Cl_2 reaction see (4); from toluene with $AlCl_3 + SO_2Cl_2$ (34% $\bar{C} + 40\%$ 2,4,5-trichlorotoluene (3:2100)) see (2); for formn. of \bar{C} (together with other isomers) from toluene, o-chlorotoluene (3:8245), or p-chlorotoluene (3:8287) with Cl_2 see (1); from 2,3-dichlorotoluene (3:6345) or 2,4-dichlorotoluene (3:6290) with Cl_2 in pres. of Al/Hg see (5); for prepn. of \bar{C} from its sulfonic acid by hydrolysis see (1) (7).]

[C with Cl₂ in pres. of Al/Hg yields (6) 2,3,4,6-tetrachlorotoluene (3:2480).]

 \bar{C} on mononitration (1) (4) by soln. in cold fumg. HNO₃ yields a mononitro \bar{C} [Beil. V-333], ndls. from alc., m.p. 60-61° (4), 60° (1); \bar{C} on dinitration by warming with a mixt. of 2 pts. fumg. HNO₃ and 1 pt. conc. H₂SO₄ (1) (4) cf. (7) yields 2,3,4-trichloro-5,6-dinitro-toluene [Beil. V-345], ndls. from alc., m.p. 141° (1) (2), 140-141° (4).

 \bar{C} on shaking with 2 pts. fumg. H₂SO₄ at 60° yields (1) (7) a monosulfonic acid (use in sepn. of \bar{C} from 2,4,5-trichlorotoluene (3:2100) which is not sulfonated under these conditions (1) (7)).

 \bar{C} on oxidn, with dil. HNO₃ in s.t. at 150° (4) yields 2,3,4-trichlorobenzoic acid (3:4810), m.p. 186-187° (4).

3:0425 (1) Scelig, Ann. 237, 132, 137, 138, 140, 156 (1887). (2) Silberrad, J. Chem. Soc. 127, 2681-2682 (1925). (3) I.G., Brit. 287,178, May 9, 1928; Cent. 1929, II 352. (4) Cohen, Dakin, J. Chem. 3:0440 CHLOROPIVALIC ACID

(β-Chloro-α,α-dimethylpropionic acid)

CH₂-C-CC

M.P. 40-42° (1) B.P. 126-129° at 30 mm. (1)

[For prepn. of \bar{C} from pivalic acid (trimethylacetic acid) (1:0410) with SO_2Cl_2 + dibenzoyl peroxide in CCl_4 see (1).]

© Chloropivalamide: pl. from aq., m.p. 108-109° (1).

3:0440 (1) Kharasch, Brown, J. Am. Chem. Soc. **62**, 925-929 (1940). (2) Kharasch, Brown (to du Pont Co.), U.S. 2,302,228, Nov. 17, 1942; C.A. **37**, 2018 (1943).

3: 0455 2,6-DICHLORO-2,6-DIMETHYLHEPTANE
$$C_9H_{18}Cl_2$$
 Beil. I - 167 I_1 — I_2 —(129) CH_3 — C — CH_2 . CH_2 . CH_2 — C — CH_3 CH_3

68

M.P. 41-42° (1)

[For prepn. of \bar{C} from 2,6-dimethylheptanediol-2,6 [Beil. I-494] (2) with conc. HCl or AcCl see (1) (2); from the corresponding internal ether, viz., $\alpha,\alpha,\alpha',\alpha'$ -tetramethylpentamethylene oxide (2,2,6,6-tetramethyltetrahydropyran) [Beil. XVII-17], with HCl see (1).]

 \bar{C} on warming with aq. readily hydrolyzes (1) back to 2,6-dimethylheptanediol-2,6 (monohydrate, cryst. from C_6H_6 , m.p. 60-61°; anhydrous form by heating monohydrate at 135-140°, m.p. 76-77° (1).

[\bar{C} in C_6H_6 + AcOH treated with Zn dust in a stream of dry HCl yields (2) mixt. of α - and β -cyclogeraniols [Beil. VI-66, VI₁-(43)].]

3:0455 (1) Bruylants, Bull. acad. roy. Belg. **1909**, 276–282; Cent. **1909**, II 797; C.A. **4**, 1485 (1910); Rec. trav. chim. **29**, 130–133 (1910). **(2)** Staudinger, Widmer, Helv. Chim. Acta **9**, 531, 546–547 (1926).

3: 0460
$$\beta$$
-CHLOROPROPIONIC ACID $C_3H_5O_2Cl$ Beil. II - 249 (3-Chloropropanoic acid) ClCH₂.CH₂.COOH II₁-(111) II₂-(226) M.P. 42° (1) (2) B.P. 204° (11) 41.5° (3) 203-205° at 764 mm. (12)

41.5° (3)203-205° at 764 mm. (12) 41° (4) (19) 127 at 35 mm. (13)40.5° cor. (5) 120° at 30 mm. (27)40° (6)(7)124° at 25 mm. (1) 39° 105-107° at 20 mm. (8) (9) (14)38.5-39.5° (10) 108° at 12 mm. (1)

Lfts. from lgr. or pet. eth. — Very eas. sol. aq., alc., $CHCl_3$; spar. sol. dry ether. — Fairly hygroscopic. — \tilde{C} on boilg. slightly dec. to HCl + acrylic ac. (1:1020). [Note that samples with m.p. higher than 42° may have contd. adipic ac. (8).] [For stability of \tilde{C} in aq. soln. see (8).]

[For prepn. of \bar{C} from acrolein (1:0115) via addn. of HCl to β -chloropropionaldehyde (3:5576) and subsequent oxidn. with fumg. HNO₃ (yield: 65-70% (14), 60-65% (15), 50% (1)) see (15) (14) (7) (1) (16); from 3-chloropropanol-1 (trimethylene chlorohydrin) (3:8285) by oxidn. with conc. HNO₃ (yield: 78-79% (9)) (17) (13) (27) or alk. KMnO₄ (18) see indic. refs.; from β -hydroxypropionitrile (ethylene cyanohydrin) by hydrolysis with HCl see (10); from phosgene + ethylene + AlCl₃ via hydrolysis of intermediate β -chloropropionyl chloride (3:5690) see (19); for other methods see Beil. II-249.]

Č on htg. with aq. alk. or alk. carbonates (1) (7) (19) or on passing over activated carbon at 230-240° at 250-320 mm. (21) loses HCl and yields acrylic ac. (1:1020). [The alk. salts of Č dec. even at ord. temp. giving alk. chlorides (3).] [For example of use of Č as source of acrylic acid in Diels-Alder addn. reactions see under 9,10-dichloroanthracene (3:4916).]

 \tilde{C} with PCl₃ (12) or SOCl₂ (22) yields β -chloropropionyl chloride (3:5690) q.v., b.p. 144°.

Č (1 g.) + pyridine (2 g.) htd. at 100° solidifies after 2 hrs. to give 100% yield addn. cpd. Č.C₅H₅N, pr. from abs. alc., m.p. 160° (26).

- —— Methyl β-chloropropionate: b.p. 148-150° at 760 mm. (3:5765)
- Ethyl β -chloropropionate: b.p. 162-163° at 760 mm. (3:8290).
 - ---- β-Chloropropionamide: unrecorded.
- Φ β-Chloropropionanilide: cryst. from aq. or MeOH, m.p. 119° (23). [From β-chloropropionyl chloride + aniline in acetone in 90% yield (23).]
- **Φ** β-Chloropropion-p-toluidide: cryst. from MeOH, m.p. 121° (23) (22).
- Φ β-Phenoxypropionic acid: ndls. from hot aq. (24) or lgr. (25); m.p. 98° (24), 97-98° (25). [From \bar{C} + phenol + NaOH, 36% yield (25).]

[See also o-chlorophenol (3:5980).]

 \bar{C} has disagreeable and persistent odor (15) for study of strength of which in aq. soln. see (16). — \bar{C} is spar. sol. aq. at ord. temp. (for details see (17)); but \bar{C} is eas. sol. alc., ether, C_6H_6 , $CHCl_3$, CS_2 . — \bar{C} (like its o-isomer (3:5980)) is volatile with steam (for studies see (18)) even from soln. in equiv. aq. NaOH (19) (dif. and sepn. from 2,4-dichlorophenol (3:0560), 2,6-dichlorophenol (3:1595), and 2,4,6-trichlorophenol (3:1673) (19).

The cryoscopic const. of \bar{C} is 85.8 (20).

SELECTED DATA ON BINARY SYSTEMS CONTG. C

 \overline{C} + aq.: for solubility/temp. data see (17).

 $\bar{C} + C_6H_6$: for solubility/temp. data (17) or for vapor-press. data (21) see indic. refs.; for association of \bar{C} in C_6H_6 soln. see (30). $\bar{C} + \text{MeOH}$ (1:6120): for vapor-press. data see (21). $\bar{C} + \text{acetone}$ (1:5400): for vapor-press. data see (21). $\bar{C} + \text{methyl}$ acetate (1:3005): for vapor-press. data see (21).

 $\ddot{\mathbf{C}}$ + nitrobenzene: for f.p./compn. data and diagrams see (24) (25), eutectic m.p. -24.5° contg. 41.5 wt. % $\ddot{\mathbf{C}}$ (24), m.p. -30.5° contg. 50.5 mol. % $\ddot{\mathbf{C}}$ (25).

 \overline{C} + aniline: for D^{25} and D^{50} + viscosity at 25° and 50° sec (26). \overline{C} + p-toluidine: for f.p./compn. and n_D^{54} /compn. data and diagrams see (4) cf. (29); note two eutectics, E_1 , m.p. 21° contg. 28 mol. % \overline{C} , and E_2 , m.p. 7.4° contg. 71 mol. % \overline{C} (4). \overline{C} + benzylamine: for f.p./compn. diagram see (27), noting two molecular cpds., one of compn. 3 \overline{C} .1 benzylamine, m.p. 55°, the other 1 \overline{C} .1 benzylamine, m.p. 16° (27). \overline{C} + phenylhydrazine: for f.p./compn. data and diagram see (1).

 \bar{C} + piperidine: for n_{D}^{65} /compn. data see (23).

 $\bar{\bf C}$ + pyridine: for f.p./compn. diag. of entire system see (4) cf. (28) (note two eutectics, viz., E_1 , m.p. -19.5° contg. 66.6 mol. % $\bar{\bf C}$, E_2 , m.p. -47.3° contg. 13.5 mol. % $\bar{\bf C}$); for n_D^{25} /compn. and n_D^{50} /compn. data over entire system see (14).

 $\ddot{\mathbf{C}}$ + o-chlorophenol (3:5980): for f.p./compn. data and diagram see (3) (note that the eutectic, m.p. about -20.5° , conts. about 38.5 mol. % $\ddot{\mathbf{C}}$). $\ddot{\mathbf{C}}$ + p-dichlorobenzene (3:0980): for f.p./compn. diagram see (4) (note eutectic m.p. 27.2° contg. 73.4 mol. % $\ddot{\mathbf{C}}$); for $n_{\mathbf{D}}^{54}$ / compn. data see (4).

AZEOTROPIC SYSTEMS CONTG. Č

 $\bar{\bf C}$ with naphthalene (1:7200) forms a const.-boilg. mixt., b.p. 216.3° contg. 36.5% $\bar{\bf C}$ (11). $\bar{\bf C}$ with *p*-dibromobenzene forms a const.-boilg. mixt., b.p. 215.05° contg. 35% $\bar{\bf C}$ (11).

PREPARATION OF C

From p-chloroaniline. [For prepn. of \bar{C} from p-chloroaniline [Beil. XII-607, XII₁-(304)] via diazotization to salts of p-chlorobenzenediazonium hydroxide [Beil. XVI-463, XVI₁-(355)] and hydrolysis of the latter (yields not stated) (3) (10) in an inert solvent (31) see indic. refs.; for study of rate of hydrolysis (32) of p-chlorobenzenediazonium chloride and influence of light thereon (33) see indic. refs.]

From phenol. [For prepn. of \bar{C} from phenol (1:1420) with Cl₂ at temps. over range 40°-155° see (3) cf. (6) (35); with Cl₂ + conc. aq. Na₂CO₃ soln. see (34); by use of N,N-dichlorobenzenesulfonamide in CHCl₃ at -15° see (36) (note that evidence obtd. from this reaction in pres. of isobutylene indicates that phenyl hypochlorite is first formed and subsequently rearranges (36)); by use of N,N'-dichlorourea + HCl see (37); with EtOCl (3:7022) in CCl₄ at -20° see (38); or by use of SO₂Cl₂ see (39) (40) (41) (for use of SO₂Cl₂ on NaOC₆H₅ see (7)). — Note that in all these methods some o-chlorophenol (3:5980) is usually also formed.]

From p-aminophenol. [For form. of \bar{C} from p-aminophenol [Beil. XIII-427, XIII₁-(143)] via diazotization, conversion to corresp. PtCl₄ double salt, and dry distn. see (42); or via diazotization, conv. to corresp. ZnCl₂ double salt, and decompn. by addn. of molten phenol (yield 40% accompanied by 41% hydroxybiphenyl + 11% diphenyl ether) see (43).]

From p-dichlorobenzene. [For prepn. of \tilde{C} from p-dichlorobenzene (3:0980) with MeOH/NaOMe in s.t. at 180° (44) (45), or with MeOH/NaOH in s.t. at 190-195° (90%) yield (46)) or at 200° for 25 hrs. under press. (8), see indic. refs.; for use of aq. alk. or alk. earths with MeOH in pres. of copper salts at 150-190° under press. see (47) (note, however, that, although the hydrolysis of p-dichlorobenzene to \tilde{C} is markedly facilitated by presence of Cu, e.g., with aq. NaOH, maximum yield is 30% while with MeOH/NaOH + Cu yield is 85% (48), yet in presence of Cu₂O some ord. phenol (1:1420) is also formed (49); for prepn. of \tilde{C} from p-dichlorobenzene (3:0980) by vapor-phase hydrolysis with steam + cat. at 550-850° see (50).]

From other miscellaneous sources. [For formn. of \bar{C} from various p-chlorophenyl ethers by cleavage, e.g., from p-chloroanisole (3:6300) with conc. HCl in s.t. (51) or with MeOH/NaOMe in s.t. at 176° (45); from p-chlorophenetole (3:0090) with conc. HCl (52) or with HBr in AcOH (85% yield (53)); or from p-chlorophenoxyacetic acid (3:4375) with conc. HCl in s.t. at 150° (34), see indic. refs.]

 $[\bar{C}]$ is also obtainable by hydrolysis of its various esters, but these need not be cited here.] [For formn. of \bar{C} from p-bromophenol with SO_2Cl_2 at ord. temp. see (55); from calcium salt of p-dichlorobenzenesulfonic acid with $Ca(OH)_2 + Cu$ at 200-220° followed by removal of the sulfonic acid group from the resultant p-chlorophenolsulfonic acid see (56).]

BIOCHEMICAL ASPECTS OF C

[For studies involving fate of \bar{C} in animal metabolism see (57) (58) (59); for studies from various aspects of bactericidal and fungicidal action of \bar{C} see (60) (61) (62) (63) (64) (65) (67) (68).]

[For studies from various aspects of effect of \bar{C} and other chlorophenols on taste of water see (69) (70) (71) (72) (73).]

MISCELLANEOUS USES OF C

[For use of \bar{C} in selective solv. refining of mineral oils see (74); as denaturant for alc. see (75); as solv. for lignin see (76).]

QUANT. DETN. OF C

See text below under bromination of $\bar{\mathbf{C}}$, iodination of $\bar{\mathbf{C}}$, and nitration of $\bar{\mathbf{C}}$.

CHEMICAL BEHAVIOR OF C

Pyrolysis of C

[Č on pyrolysis through silica tube at red heat gives (77) 3,6-dichlorodiphenylene oxide, m.p. 188° (77).]

REDUCTION OF C

[\bar{C} with H_2 + Ni cat. in aq. or aq. alc. alk. soln. loses chlorine quant. as HCl (78) (for study of rate see (79)); note also that \bar{C} with Li at 220° (80) or with Ca at 160° (80) followed by treatment with aq. gives (yields 14% and 36% resp.) phenol (1:1420). — Note that \bar{C} with aq. Cu₂O at 250–380° under press. gives (81) phenol (1:1420) (see also above under prepn. of \bar{C} from p-dichlorobenzene). — Note that reduction of \bar{C} to 4-chlorocyclohexanol-1 (3:9376) appears to be unreported.]

OXIDATION OF C

[$\bar{\mathbf{C}}$ on oxidn. with 35% peracetic acid at 25° gives (82) slowly (17 days) in small yield β -chloromuconic acid (2-chlorobutadien-1,3-dicarboxylic acid-1,4), m.p. 223°, accompanied in the mother liquor by some lactone ($C_6H_5O_6Cl$) of 3-chloro-4,5-dihydroxyhexen-2-dioic acid-1,6, m.p. 177° (82). — $\bar{\mathbf{C}}$ on electrolytic oxidn. gives (83) benzoquinone-1,4 (1:9025).].

NUCLEAR SUBSTITUTION OF C

(See also below under condensation reactions of C.)

Halogenation of \tilde{C}. Fluorination. [The fluorination of \tilde{C} has not been reported, and no fluoro- or difluoroderiv. of \tilde{C} is known.]

Chlorination. [\bar{C} with Cl₂ (2 moles) in AcOH in cold gives (80% yield (84)) 2,4-dichorophenol (3:0560), m.p. 45°; presumably \bar{C} with Cl₂ (3 moles) would give 2,4,6-trichlorophenol (3:1673), but such reaction is not actually reported. — For study of rate of chlorination of \bar{C} with Cl₂ in CCl₄ (85) or with NaOCl in alk. soln. at 25° (86), or behavior of \bar{C} with Cl₂ in presence of radioactive HCl in C₆H₆ soln. (87), see indic. refs.]

Bromination. [C with Br₂ (1 mole) in CCl₄ at room temp. gives (62% yield (88)) 2-bromo-4-chlorophenol, m.p. 33-34°, b.p. 121-123° at 10 mm. (corresp. benzoyl deriv., m.p. 99-100°) (88).]

Č with Br₂ (2 moles) in AcOH (89) (90) (91) or Č with Br₂ (2 moles) in aq. KBr soln. (92) gives (yields not stated) 4-chloro-2,6-dibromophenol, ndls. from dil. alc., m.p. 92° (89), 90° cor. (92), 89° (90) (corresp. methyl ether, m.p. 74° (92); 2,4-dinitrophenyl ether, m.p. 145-146° (90), p-toluenesulfonate, m.p. 107-108° (90)). [Note difference from the isomeric 4-chloro-3,5-dibromophenol, m.p. 121° (93), 118° (94) (corresp. Me ether, m.p. 82.5° (93), benzoyl deriv., m.p. 132° (94)).]

[Č with Br₂ (4 moles) in pres. of Fe powder gives (93) 4-chloro-2,3,5,6-tetrabromophenol, m.p. 215° (corresp. methyl ether, m.p. 161°, benzoyl deriv., m.p. 203° (93)).]

[For quant. detn. of C by dibromination with KBrO₃/KBr soln. see (95) (96) (97).]

Iodination. \bar{C} with I₂ (1 mole) in aq. KI + conc. NH₄OH gives (88% yield (98)) 4-chloro-2-iodophenol, ndls. from CHCl₃ or lt. pet., m.p. 78° (98) (99) (corresp. acetyl deriv., m.p. 57° (98); corresp. benzoyl deriv., m.p. 88° (99), 83-84° (98); corresp. N-phenyl-carbamate, m.p. 128° (99)).

 \bar{C} with excess I_2 in eq. KI + conc. NH₄OH (98), or \bar{C} in alk. soln. with I_2 in eq. KI (92),

or \overline{C} in alk. soln. with $I_2 + KIO_3$ followed by dil. H_2SO_4 (89), or \overline{C} with ICl (99), gives (89% yield (98)) 4-chloro-2,6-iodophenol, ndls. from alc. or lt. pet., m.p. 109° cor. (92), 108° (98) (100), 107-108° (89), 106-107° (99) (corresp. methyl ether, m.p. 79° (92); corresp. acetyl deriv., m.p. 128° (98), 127.5° (100)).

[For quant. detn. of \bar{C} by di-iodination using I_2 + borax soln. see (97).]

Nitration of \bar{C} . \bar{C} on mononitration with dil. HNO₃ (101) (102), or with 30% HNO₃ in cold (103), or with nitrosulfonic acid + fumg. HNO₃ (104), or in MeOH with HNO₃ (105), gives (yields 90% (103), 85% (102), 77% (104)) 4-chloro-2-nitrophenol [Beil. VI-238, VI₁-(122)], yel. cryst. from alc., volatile with steam, m.p. 86-87° (101) (102) (corresp. methyl ether, m.p. 98° (44), 97.5° cor. (106); corresp. ethyl ether, m.p. 61-62° (101); corresp. benzyl ether, m.p. 84-85° (99)). — [For use of mononitration in quant. detn. of mixts. of \bar{C} with o-chlorophenol (3:5980) see (107) cf. (112).]

C on dinitration with conc. HNO₃ (108) (or the above 4-chloro-2-nitrophenol on further nitration with fumg. HNO₃ (101)) gives 4-chloro-2,6-dinitrophenol [Beil. VI-260, VI₁-(128)], yel. ndls. or lfts. from aq., ndls. or pr. from alc., ether, or CHCl₃, m.p. 81° (108) (corresp. methyl ether, m.p. 66° (109), 64° (94); corresp. ethyl ether, m.p. 54-55° (110); corresp. N-phenylcarbamate cannot be prepared (111)).

Nitrosation of C. [Unlike the isomeric o-chlorophenol (3:5980) the nitrosation of C has not been reported, and no nitroso-p-chlorophenol is known.]

Sulfonation of \bar{C} . [\bar{C} with equiv. amt. fumg. H_2SO_4 (D=1.90) at 100° (113) (114) gives 4-chlorophenolsulfonic acid-2 [Beil. XI-236], deliquescent tbls. of monohydrate from aq., m.p. 75-76° (113) (for study of acid strength see (115)). — Note also that \bar{C} with very large excess (15 wt. pts.) fumg. H_2SO_4 (20% SO_3) gives (80-85% yield (116)) a bimolecular condensation prod. of the above sulfonic acid.]

Mercuration of \bar{C} . [\bar{C} with HgO/HgSO₄ on warming, followed by neutraliz. with NaOH, gives (117) 4-chloro-2-hydroxymercuriphenol [Beil. XVI₁-(564)]. — For other studies of mono- and di-mercuration of \bar{C} see (118) (119); for patents see (120) (121).]

CONDENSATION REACTIONS INVOLVING NUCLEAR HYDROGEN OF C

With alcohols. \tilde{C} with alcs. contg. more than one C in pres. of conc. HClO₄ at 0-160° gives ultimately (although doubtless through formn. of intermediate esters followed by rearr. or intermediate formn. of olefins followed by addn.) (122) the corresp. 2-alkyl-4-chlorophenols [e.g., \tilde{C} with isopropyl alc. (1:6135) + conc. HClO₄ as directed (122) gives 4-chloro-2-isopropylphenol, sol. aq. NaOH, b.p. 235-250° accompanied by 4-chloro-2,6-diisopropylphenol, insol. aq. NaOH, m.p. 260-265°].

With aldehydes. [$\bar{\mathbb{C}}$ with formaldehyde (1:0145) + conc. HCl + H₂SO₄ is claimed (123) to undergo simple chloromethylation yielding 5-chloro-2-hydroxybenzyl chloride, m.p. 85° (123); note, however, that further condensation (involving 2 additional moles of formaldehyde) may occur giving (67% yield (124)) 6-chloro-8-(chloromethyl)benzodioxane-1,3, cryst. from MeOH, m.p. 103° (124). — $\bar{\mathbb{C}}$ with formaldehyde (1:0145) + aq. alkali gives (125) 4-chloro-2,6-bis-(hydroxymethyl)phenol ("p-chlorophenol dialcohol"), m.p. 154° (126) (corresp. mono-(p-toluenesulfonate), m.p. 151° (127)); note that reaction of $\bar{\mathbb{C}}$ with 1 mole formaldehyde to give 4-chloro-2-(hydroxymethyl)phenol (5-chlorosalicyl alcohol) is not reported although the latter [Beil. VI-893], m.p. 93°, is known.]

With CHCl₃, chloral, or hexamethylenetetramine. [Č with CHCl₃ + EtOH + aq. NaOH (128), or Č with hexamethylenetetramine in anhydrous glyceroboric acid at 150-155° followed by H₂SO₄ hydrolysis (129), or Č with chloral + anhydrous Na₂HPO₄ at 70-75° (giving (4-chloro-2-hydroxyphenyl)-trichloromethyl-carbinol cf. (130)) followed by hydrolysis + oxidation (131), gives (18% yield (129)) 5-chloro-2-hydroxybenzaldehyde (5-chlorosalicylaldehyde) (3:2800), m.p. 99-100°.]

With CCl₄. [C with CCl₄ in aq. NaOH (128) in pres. of Cu or Cu compds. (132) or C with CCl₄ in alc. KOH in s.t. at 140° for 5-6 hrs. (133) gives 5-chloro-2-hydroxybenzoic acid (5-chlorosalicylic acid) (3:4705), m.p. 172°.]

With CO₂ or organic acids. [C (as dry NaA) with CO₂ at 140-150° under press. gives (135) (136) Na salt of 5-chlorosalicylic acid (3:4705) (see also above).]

[C with o-chlorobenzoic acid (3:4150) in MeOH/NaOMe + trace Cu powder evapd., htd. at 200°, then htd. with conc. H₂SO₄ for 15 min. gives (136) 2-chloroxanthone, m.p. 165° (136).]

With acid chlorides of organic acids. The conventional type of reaction of \bar{C} with acyl halides is to form the corresp. p-chlorophenyl esters (see also below under reactions of phenolic hydrogen of \bar{C}); however, with \bar{C} acid chlorides in pres. of AlCl₃ the ultimate product (undoubtedly formed by rearr. of an intermediate ester) is the ketone [e.g., \bar{C} with benzoyl chloride (3:6240) + AlCl₃ in CS₂ (137) or acetylene tetrachloride (3:5750) (138) gives 4-chloro-2-benzoylphenol (5-chloro-2-hydroxybenzophenone), m.p. 95.0-95.5° (138), 94-95° (139), 94° (137), 93-94° (140), frequently accompanied by p-chlorophenyl benzoate, m.p. 87° (see below); for analogous behavior of \bar{C} with p-toluyl chloride (3:8740) see (138)].

With anhydrides. [\bar{C} with phthalic anhydride (1:0725) + AlCl₃ at 140-145° (141) cf. (143) or in acetylene tetrachloride (3:5750) (142) gives (70% yield (142)) o-(5-chloro-2-hydroxybenzoyl)benzoic acid [Beil. X_{1} -(470)], cryst. from hot AcOH, acetone, or alc., m.p. 202°, after sintering at 192° (142); this product ring-closes under the conditions of its formn (141) (142) (143) (144) or with cone. H_2SO_4 at 100° (144) (142) cf. (141) giving 4-chloro-1-hydroxyanthraquinone [Beil. VIII-340, VIII₁-(651)], yel.-or. ndls. from AcOH or pyridine, m.p. 194° (141), 193-194° (145), 192-193° (146), 189° (142), 188° (147) (corresp. methyl ether, m.p. 168° (145), corresp. acetate, m.p. 176-177° (146)), also obtd. (70% yield (145)) directly from \bar{C} with phthalic anhydride (1:0725) + AlCl₃ + NaCl at 200-220° for 3 hrs. (See also next paragraph.)]

[Note, however, that \bar{C} with phthalic anhydride (1:0725) + conc. H_2SO_4 at 200° (148) (149) or in pres. of conc. $H_2SO_4 + H_3BO_3$ at 200° for $3\frac{1}{2}$ hrs. (150) (151) (143) (152) (153) (154) (155) (156) goes further than above giving (yield: 68-74% (150)) 1,4-dihydroxyan-thraquinone (quinizarin) (1:9085), cryst. from AcOH, m.p. 200-202° cor. (150).]

[C with 4-chlorophthalic anhydride (3:2725) + H₃BO₃ + fumg. H₂SO₄ at 175–195° for 20 hrs. gives (157) 6-chloro-1,4-dihydroxyanthraquinone (6-chloroquinizarin), tbls. from toluene, m.p. 188° (158) (corresp. dimethyl ether, m.p. 168.5° (158); diacetate, m.p. 213° (158)). — For completely analogous behavior under similar circumstances of C with 3,4-dichlorophthalic anhydride (3:3695) or C with 4,5-dichlorophthalic anhydride (3:4830) see these cpds.]

[\bar{C} with 4-sulfophthalic anhydride + H_3BO_3 + H_2SO_4 at 200° for 4 hrs. gives (45% yield (159) (160) cf. (161)) 1,4-dihydroxyanthraquinonesulfonic acid-6 (6-sulfoquinizarin) [Beil. XI-357]; for study of Na salt of latter as acid-base indicator see (162).]

[For behavior of \bar{C} with 3-methylphthalic anhydride + AlCl₃ (144) (163), with 4-methylphthalic anhydride + AlCl₃ (163), with naphthalene-1,2-dicarboxylic acid anhydride + AlCl₃ + NaCl (164), or with naphthalene-2,3-dicarboxylic acid anhydride + AlCl₃ + NaCl (165), see indic. refs.]

With esters of keto acids. [\bar{C} (1 mole) with ethyl acetoacetate (1:1710) + conc. H₂SO₄ stood 24 hrs. gives (2.7% yield (166)) 6-chloro-2-methylcoumarin [Beil. XVII-336, XVII₁-(173)], m.p. 186–187° (167), 186° (168), 185° (170), 184–185° (166), 184° (169); note, however, that 4-chloro-2-acetylphenol (5-chloro-2-hydroxyacetophenone) (see below) with Ac₂O + NaOAc at 160–170° for 5 hrs. gives (167) both the above 6-chloro-2-methylcoumarin and the isomeric 6-chloro-2-methylchromone, ndls. from AcOH, m.p. 115–116° (167).]

[Note also that \bar{C} with α -alkylacetoacetates + P_2O_5 gives the corresp. chromones: e.g.,

 $\bar{\mathbf{C}}$ with ethyl α -methylacetoacetate (1:1712) gives (17% yield (171)) 6-chloro-2,3-dimethyl-chromone, m.p. 107°; $\bar{\mathbf{C}}$ with ethyl α -ethylacetoacetate (1:1723) gives (171) 6-chloro-3-ethyl-2-methylchromone, m.p. 109°; $\bar{\mathbf{C}}$ with ethyl α -(n-propyl)acetoacetate gives (172) 6-chloro-2-methyl-3-n-propylchromone, m.p. 108°; $\bar{\mathbf{C}}$ with ethyl α -isopropylacetoacetate gives (172) 6-chloro-2-methyl-3-n-propylchromone, m.p. 108°; $\bar{\mathbf{C}}$ with ethyl α -isopropylacetoacetate gives (172) 6-chloro-3-isopropyl-2-methylchromone, m.p. 127°.]

[C with diethyl oxaloacetate + conc. H₂SO₄ at 0° gives (small yield (170)) ethyl 6-chlorocoumarin-4-carboxylate [Beil. XVIII₁-(493)], yel. ndls., m.p. 96-97°; C with diethyl acetonedicarboxylate (1:1772) + conc. H₂SO₄ gives (6% yield (170)) ethyl 6-chlorocoumarinyl-4-acetate [Beil. XVIII₁-(493)], m.p. 167°.]

With diazonium salts. \bar{C} in alk. soln. couples with diazonium salts giving upon acidification the corresp. chloro-hydroxy-azo derivs. [e.g., \bar{C} with benzenediazonium chloride (aniline diazotized in HCl soln.) gives (173) 4-chloro-2-(benzeneazo)phenol (5-chloro-2-hydroxyazobenzene) [Beil. XVI-93], red-or. ndls. from AcOH, mp. 110-111° (173) (174); \bar{C} with diazotized p-nitroaniline gives (175) 4-chloro-2-(p-nitrobenzeneazo)phenol, m.p. 140-143°; for patent on coupling of \bar{C} with other diazonium salts see (176)].

With other miscellaneous reactants. [For condensation of \bar{C} with indene (di)chloride (2,3-dichloroindane) see (177); for condensation of \bar{C} with o-nitrobenzenesulfinic acid (178) or with 2-chloro-5-nitrobenzenesulfinic acid (179) see indic. refs.; for oxidative condensation of \bar{C} with N,N-dialkyl-p-phenylenediamines, etc., to give various indophenols see (180).] $[\bar{C}$ (2 moles) with SCl₂ (1 mole) in CCl₄ at -10° (181) or in CS₂ at $40-45^{\circ}$ (70% yield (182)) or \bar{C} with S₂Cl₂ in CS₂ at room temp. (42% yield (182)) gives bis-(5-chloro-2-hydroxyphenyl) sulfide [Beil. VI₁-(396)], ndls. or lfts. from C₆H₆, m.p. 175° (183), 174° (182), 173-174° (184), 173° (181) (corresp. dimethyl ether, m.p. 112° (182); diethyl ether, m.p. 145° (185), dibenzoate, m.p. 145° (182)); for use as disinfectant (181) (183) or in mothproofing compositions (186) see indic. refs.]

[\bar{C} (2 moles) with SOCl₂ (1 mole) + AlCl₃ in CS₂ gives (70% yield (184)) bis-(5-chloro-2-hydroxyphenyl) sulfoxide [Beil. VI₁-(396)], pr. from dil. alc., m.p. 202° (corresp. dinitration prod., m.p. 180–181° (184)).]

REACTIONS INVOLVING NUCLEAR HALOGEN OF C

[\bar{C} on fusion with KOH (187) (188) or \bar{C} with aq. alkali or alk. carbonates in pres. of Cu or Cu compds. at elevated temp. under press. (189), or \bar{C} with aq. Ba(OH)₂ at 170–195° under press. (190), or \bar{C} with alkali or alk.-earth hydroxides + Cu salts at elevated temp. under press. (191) gives 1,4-dihydroxybenzene (hydroquinone) (1:1590); note, however, that in such fusions with alkali some 1,3-dihydroxybenzene (resorcinol) (1:1530) is also formed (187) (188) (192) (193), and \bar{C} (as Na \bar{A}) with NaOH at 310° for 5 hrs. gives (194) as high as 38% resorcinol (1:1530) + a trace of 2,4'-dihydroxybiphenyl; however, \bar{C} on fusion with K₂CO₃ is claimed (193) to yield only hydroquinone (1:1590).]

 $[\bar{C} \text{ with Na}_2S + \text{NaOH at 210-215}^\circ \text{ for 24 hrs. gives (195) 4-mercaptophenol (monothiohydroquinone)}$ [Beil. VI-859, VI₁-(419)], m.p. 29-30°.]

 $[\bar{C} \text{ with NH}_3 \text{ in pres. of Cu cpds. htd. under press. gives (196) } p-aminophenol; <math>\bar{C} \text{ similarly with prim. aliphatic amines gives (196) corresp. } N-alkyl-p-aminophenols.]$

REACTIONS OF C INVOLVING PHENOLIC H (I.E., H OF THE OH GROUP)

Acidic strength. $\ddot{\mathbf{C}}$ behaves as weak acid, is soluble in aq. alk. or in large excess (2.75 moles of 2 N (197)) aq. Na₂CO₃ soln. from which it is repptd. by CO₂ (197). — Dissoc. const. of $\ddot{\mathbf{C}}$ in aq. at 28.5° = 6.6 × 10⁻¹⁰ (198); for studies of dissoc. const. in other solutions, e.g., in 50% MeOH at 20° (199) (200) or at 28.5° (198), or at 18° over range 0-95% MeOH by volume (203), in 30% aq. EtOH at 25° (200) (9) (201), or at 18° over range

0-95% EtOH by vol. (202), see indic. refs. — For hydrogen potential of \bar{C} in 48.95 vol. % EtOH or 95 vol. % EtOH at 20° see (204). — For titration of \bar{C} with standard NaOH and indicator see (205).

Salts of C. [NaA; from C in abs. EtOH with equiv. Na, evapd. under H₂, dried at 140-150° (134); very hygroscopic ndls. from conc. alc. soln., turning brown in air; in contrast to Na phenolate is fairly eas. sol. dry ether (206); for behavior with CO₂ at 140-150° giving Na salt of 5-chlorosalicylic acid (3:4705) see (134) (135).]

 $[\bar{C} (38.4 \text{ pts.}) \text{ with KOH } (5.6 \text{ pts.}) \text{ in } C_6H_6 \text{ gives } (207) \text{ KA.}2\bar{C}.]$

[Č with AlCl₃ evolves heat and HCl giving (208) Cl.C₆H₄.OAlCl₂, m.p. 185–187° (208).] [For patents on use of alkali salts of C as anti-gumming agents for motor fuels see (209); for use of aq. solns. of salts of C as wash liquid for fuel gas purification see (210).]

ETHERIFICATION (see also below under D's)

Aliphatic ethers of \tilde{C} . \tilde{C} with alkyl halides usually in presence of an acid acceptor gives the corresponding p-chlorophenyl ethers [e.g., for methyl ether (p-chloroanisole) (3:6300) or for ethyl ether (p-chlorophenetole) (3:0090) see these compds. — p-Chlorophenyl n-propyl ether appears to be unreported; for p-chlorophenyl isopropyl ether, b.p. 101° at 17 mm. (211), 73-75° at 1.5 mm. (212), $n_D^{25} = 1.5127$ (212), see indic. refs. — For p-chlorophenyl isobutyl ether, b.p. 95-97° at 3 mm., $n_D^{25} = 1.5090$, see (213); the n-butyl, sec-butyl and ter-butyl ethers are unreported. — For p-chlorophenyl n-amyl ether, b.p. 132-133° at 12 mm., p-chlorophenyl n-hexyl ether, b.p. 172° at 34 mm., p-chlorophenyl n-heptyl ether, b.p. 162° at 14 mm., and p-chlorophenyl n-hexadecyl ether, m.p. 48°, see (214)].

[\bar{C} with vinyl chloride (3:7010) + aq. NaOH + CuCl₂ at 170–190° for 10 hrs. under press. gives (215) p-chlorophenyl vinyl ether, b.p. 193–194°, $D^{20}_{-}=1.138$. — \bar{C} with allyl bromide + K₂CO₃ in acetone gives (100% yield (216)) p-chlorophenyl allyl ether, b.p. 232–234° at ord. press., 106–107° at 12 mm.; note that distn. at ord. press. causes thermal rearr. to 4-chloro-2-allylphenol, b.p. 137° at 18 mm., 124–125° at 12 mm., mp. 48° (corresp. p-nitrobenzoate, m.p. 82°) (216). — \bar{C} with methallyl chloride (3:7145) + K₂CO₃ in acetone gives (217) p-chlorophenyl methylallyl ether, b.p. 101.5° at 8 mm., $D^{20}_{20}=1.0979$, $n^{20}_{10}=1.5304$; this prod. on thermal rearr. gives (217) 4-chloro-2-methallylphenol, b.p. 113° at 8 mm., $D^{20}_{20}=1.145$, $n^{20}_{10}=1.5622$, accompanied by some 5-chloro-2,2-dimethyl-coumaran, b.p. 96° at 5 mm., $D^{20}_{20}=1.135$, $n^{20}_{10}=1.5300$ (217).]

[$\bar{\mathbf{C}}$ with ethylene oxide (1:6105) in alc. NaOEt adds giving (218) cf. (219) ethylene glycol mono-(p-chlorophenyl) ether (p-chlorophenyl) β -hydroxyethyl ether), m.p. about 28° (corresp. p-nitrobenzoate, m.p. 90-91°) (218); note that the corresp. ethylene glycol bis-(p-chlorophenyl ether) is unreported.

[\tilde{C} (as Na \tilde{A}) with 2-chloropropanol-1 (3:7917) gives (220) p-chlorophenyl β -hydroxyisopropyl ether (propylene glycol β -(p-chlorophenyl) ether), b.p. 151–153° at 18 mm. — \tilde{C} with 3-chloropropanediol-1,2 (glycerol α -monochlorohydrin) (3:9038) in alk. soln. (221), or \tilde{C} with glycerol (1:6540) + NaOAc at 200–210° in atmosphere of illuminating gas (222) gives p-chlorophenyl β , γ -dihydroxy-n-propyl ether (glycerol α -(p-chlorophenyl ether), cryst. from C_6H_6 , m.p. 80° (221), 76° (222); b.p. 214–215° at 19 mm. (221), 173–175° at 17 mm. (223).]

[\bar{C} with diethyl chlorofumarate (3:6864) + NaOEt at 150° gives (224) diethyl p-chlorophenoxyfumarate, b.p. 199–200° at 12 mm. — \bar{C} (as Na \bar{A}) + \bar{C} with ethyl phenylpropiolate as directed gives (224) ethyl β -(p-chlorophenoxy)cinnamate, m.p. 63–64°, b.p. 220–225° at 12 mm.]

Aromatic ethers of \tilde{C} . [p-Chlorophenyl phenyl ether: b.p. 161-162° at 19 mm. (225), 146-150° at 7 mm. (226), $n_D^{25} = 1.5865$ (225); note that although this prod. has not been reported by etherification of \tilde{C} it has been obtd. from diphenyl ether (1:7125) in AcOH

with Cl_2 (226), from K phenolate + p-chloroiodobenzene (225), or from p-aminophenol phenyl ether via diazotization and use of Cu_2Cl_2 reaction (226); for studies of its chlorination, bromination, iodination, and nitration see (226), for metalation see (227); note also that the product first reported (228) was impure (225).]

p-Chlorophenyl p-chlorophenyl ether (bis-(p-chlorophenyl) ether) [m.p. 30° (226) (229), b.p. 168-172° at 7 mm. (226); note that this prod. has not been reported by etherification of Č but has been prepd. from diphenyl ether (1:7125) in AcOH with Cl₂ (226), or from p-aminophenol p-chlorophenyl ether via diazotization and use of Cu₂Cl₂ reaction (226) (229); for mononitration to 4-chlorophenyl 4-chloro-2-nitrophenyl ether, m.p. 75° (see also below) or dinitration to bis-(4-chloro-2-nitrophenyl) ether, m.p. 152° (229), 154° (236), see (229) (236)].

p-Chlorophenyl o-nitrophenyl ether [from \bar{C} (as $K\bar{A}$) with o-chloronitrobenzene on htg. (230) (231) in pres. of Cu bronze (232) (yields: 75% (232), 72% (230)), pale yel. cryst. from MeOH, m.p. 46° (231), 45.5° (230), 44-45° (232), b.p. 220° at 20 mm. (232), 208° at 11 mm. (232); note that this prod. does not (229) react with piperidine at 100°].

p-Chlorophenyl m-nitrophenyl ether [m.p. 60° (233), reported only by indirect means (233)]. p-Chlorophenyl p-nitrophenyl ether: from $\bar{\mathbf{C}}$ (as $K\bar{\mathbf{A}}$) with p-chloronitrobenzene on htg. (81% yield (230)) (229) (233), m.p. 76.5° (230), 76° (233), 75.5-76° (229); b.p. 215° at 12 mm. (229) or as one prod. of nitration of p-chlorophenyl phenyl ether (above) (226). — [For pat. on use as insecticide see (134).]

p-Chlorophenyl 2,4-dinitrophenyl ether: from \bar{C} (as K \bar{A} (230) or Na \bar{A} (235)) with 2,4-dinitrochlorobenzene on htg. (97% yield (230)); yel. tbls. from 1:2 EtOH/AcOH, m.p. 126° (235), 123° (230).

p-Chlorophenyl 2,4,6-trinitrophenyl ether. [This prod. which should easily be obtd. from \bar{C} (as $K\bar{A}$) with 2,4,6-trinitrochlorobenzene (picryl chloride) appears to be unreported.]

p-Chlorophenyl 4-chloro-2-nitrophenyl ether: from \bar{C} (as $K\bar{A}$) with 2,5-dichloronitrobenzene on htg. (84.4% yield (230)) (229) (231) (84), pale yel. ndls. from alc., m.p. 79° (230), 78° (231), 75° (229); b.p. 215-220° at 15 mm. (229).

p-Chlorophenyl 4-bromo-2-nitrophenyl ether: from \bar{C} (as KA) with 2,5-dibromonitrobenzene on htg. (91.9% yield (230)) (236), pale yel. ndls. from AcOH, m.p. 100-101° (236), 100.5° (230).

ESTERIFICATION

Esters of inorganic acids. [\bar{C} with SOCl₂ + pyridine in C₆H₆ as directed gives (237) (238) bis-(p-chlorophenyl) sulfite, b.p. 213-214° at 12 mm., sl. dec.]

- [\bar{C} (3 moles) with PCl₃ (1 mole) at 150° gives (239) tris-(p-chlorophenyl) phosphite, m.p. 49°, b.p. 290–297° at 15 mm. (corresp. MeI addn. prod., m.p. 71° (239)); note, however, that \bar{C} with large excess PCl₃ at 100° gives (240) p-chlorophenylphosphorous dichloride Cl.C₆H₄.OPCl₂, b.p. 128–130° at 12 mm., and di-(p-chlorophenyl)phosphorous chloride (Cl.C₆H₄.O)₂=P-Cl, b.p. 225–227° at 11 mm.]
- [C (3 moles) with POCl₃ (1 mole) under reflux (241), or C with POCl₃ in cold alk. soln. (242) (243), or C (as NaA) with POCl₃ in neutral inert solv. (244), gives tri-(p-chlorophenyl) phosphate [Beil. VI-188, VI₁-(102)], m.p. 117° (241), 112° (244). Note, however, that C with POCl₃ in pres. of Mg at 130–140° gives (245) p-chlorophenylphosphoryl dichloride, Cl.C₆H₄.O—P(O)Cl₂ [Beil. VI-188, VI₁-(102)], b.p. 265° at 760 mm. (246) (247), 141° at 12 mm. (246), 95–115° at 0.1 mm. (245), accompanied by di-(p-chlorophenylphosphoryl chloride (Cl.C₆H₄.O)₂P(O)Cl [Beil. VI-188], b.p. 164–176° at 0.1 mm. (245); these two products may be hydrolyzed, respectively, to p-chlorophenylphosphoric acid [Beil. VI-188] cf. (248), m.p. 80–81° (249), and di-(p-chlorophenyl)phosphoric acid [Beil. VI-188], m.p. 126–127° (242), 133–135° cor. (248) (250).]

[For analogous behavior of C with TiCl₄ see (251).]

Esters of aliphatic organic acids (see also below under D's).

p-Chlorophenyl acetate: from \bar{C} with Ac₂O + NaOAc (252); m.p. 7-8° (252), b.p. 226-228° (253), 100-102° at 15 mm. (254), 108° at 12.5 mm. (252), 90-92° at 2.5 mm. (61), D_4^{20} = 1.2248 (252). — Note that this prod. with AlCl₃ on htg. (255) (254) (61) or \bar{C} with AcCl + FeCl₃ directly (256) gives (100% yield (255)) 4-chloro-2-acetylphenol (5-chloro-2-hydroxy-acetophenone) [Beil. VIII-86], m.p. 55° (256), 54° (61), 53.5-54.5° (167), b.p. 97-99° at 2 mm. (61) (corresp. acetate, b.p. 156-157° (140)).

p-Chlorophenyl propionate: from \bar{C} with propionyl chloride (3:7170) (140) (61); oil, b.p. 234-236° (140), 76-78° at 2 mm. (61). — Note that this prod. with AlCl₃ undergoes Fries rearr. giving (140) (61) 4-chloro-2-propionylphenol (5-chloro-2-hydroxypropiophenone), m.p. 59.7° (61), 56.5-57.5° (140) (corresp. methyl ether, m.p. 41-42°, b.p. 135-140° at 6 mm. (257)).

p-Chlorophenyl n-butyrate: from \tilde{C} with n-butyryl chloride (3:7370) (140) (61); oil, b.p. 249-251° (140), 96-98° at 3 mm. (61). — Note that this prod. with AlCl₃ undergoes Fries rearr. giving (140) (61) 4-chloro-2-(n-butyryl)phenol (5-chloro-2-hydroxy-n-butyro-phenone), m.p. 50.5° (61), 49-50° (140); b.p. 108-112° at 3 mm. (61).

p-Chlorophenyl isobutyrate: from $\bar{\rm C}$ with isobutyric acid (1:1030) + POCl₃ (258); m.p. 29°, b.p. 120° at 11 mm. (258). — Note that this prod. with AlCl₃ undergoes Fries rearr. giving (258) 4-chloro-2-isobutyrylphenol (5-chloro-2-hydroxy-isobutyrophenone), oil, b.p. 130° at 20 mm., $D_4^{20}=1.192, n_{\rm He}^{20}=1.5521$ (258).

[For generally analogous behavior of \bar{C} with *n*-valeryl chloride (3:7740), *n*-caproyl chloride (3:8168), *n*-heptanoyl chloride (3:8520), *n*-octanoyl chloride (3:8680) see (61); with chloroacetyl chloride (3:5235) see (259); with α -bromo-isovaleryl bromide see (260).]

 $\bar{\mathbf{C}}$ (as Na $\bar{\mathbf{A}}$) (2 moles) with COCl₂ (3:5000) in C₆H₆ at 130–180° under press. (261) or $\bar{\mathbf{C}}$ (as K $\bar{\mathbf{A}}$) in conc. aq. soln. with COCl₂ in toluene (262), or $\bar{\mathbf{C}}$ with trichloromethyl chloroformate (diphsogene) (3:5515) + aq. NaOH (263), gives di-(p-chlorophenyl) carbonate [Beil. VI-187], m.p. 147° (263), 144–145° (264).

Esters of aromatic organic acids (see also below under ©'s).

p-Chlorophenyl benzoute: from C with benzoyl chloride (3:6240) (265) (for study of rate at 25° sec (268)) in pres. of aq. NaOH (252) (266) (267); m.p. 87-87.5° (138), 87° u.e. (252), 86° (266) (267). — Note that this prod. with AlCl₃ undergoes Fries rearr. giving (140) 4-chloro-2-benzoylphenol (5-chloro-2-hydroxybenzophenone), m.p. 95.0-95.5° (138), 94-95° (139), 94° (137), 93-94° (140) (corresp. benzoate, m.p. 112° (139)).

p-Chlorophenyl cinnamate: from \bar{C} with cinnamoyl chloride (3:0330) (68% yield (260)), m.p. 105° (260) (269).

- ---- p-Chlorophenyl methyl ether (p-chloroanisole): oil. (See 3:6300.)
- p-Chlorophenyl ethyl ether (p-chlorophenetole): m.p. 20-21°. (See 3:0090.)
- p-Chlorophenyl acetate: m.p. 7-8° (252). [For further details see above under esters of C with aliphatic organic acids.]
 - D p-Chlorophenyl benzoate: m.p. 87.0-87.5° (138), 87° u.c. (252), 86° (266) (267).
 [From \(\tilde{C}\) with benzoyl chloride in pres. of aq. NaOH (252) (266) (267) (see also above under esters of \(\tilde{C}\) with aromatic organic acids).]
 - --- p-Chlorophenyl o-nitrobenzoate: unreported.
 - D p-Chlorophenyl m-nitrobenzoate: m.p. 124.5° (252). [From C with m-nitrobenzoyl chloride + aq. NaOH (252).]
 - D p-Chlorophenyl p-nitrobenzoate: m.p. 171° (270).
 - D p-Chlorophenyl 3,5-dinitrobenzoate: m.p. 186° (271).
 - --- p-Chlorophenyl benzenesulfonate: unreported.

- ---- p-Chlorophenyl p-toluenesulfonate: unreported.
- D p-Chlorophenyl benzyl ether: ndls. from alc., m.p. 71° (272), 70-71° (273). [Note, however, that C with benzyl chloride (3:8535) + AlCl₃ gives not only this prod. but also (273) cf. (274) some Fries rearr. prod., viz., 4-chloro-2-benzylphenol (5-chloro-2-hydroxydiphenylmethane), m.p. 48-49° (273), 48.5° (274) (corresp. benzoate, m.p. 54-55°, benzenesulfonate, m.p. 68-69°, p-toluenesulfonate, m.p. 75.0-75.5° (273)).]
- p-Chlorophenyl p-nitrobenzyl ether: cryst. from alc., m.p. 101.3° (275). [From C + p-nitrobenzyl chloride (m.p. 71°) (or p-nitrobenzyl bromide, m.p. 99°) in alc. NaOEt (275).]
- D p-Chlorophenyl 2,4-dinitrophenyl ether: yel. tbls. from 1:2 EtOH/AcOH, m.p. 126° (235), 123° (230). [From C (as KA (230) or NaA (235)) with 2,4-dinitrochlorobenzene (m.p. 51°) on htg. (97% yield (230)).]
- D p-Chlorophenoxyacetic acid (3:4375): pr. from hot aq., m.p. 156.7-157.2° cor. (279), 155-156.5° u.e. (276), 155-156° (277), 154-155° (278). [From \(\bar{\mathbf{C}}\) with chloroacetic acid in aq. alk. (279) (276) (277) (278).]
- —— p-Chlorophenyl N-phenylcarbamate: cryst. from alc., m.p. 138° (280), 137-138° (263). [From C (as NaA) with phenylisocyanide dichloride on htg. (280); note, however, prepn. from C + phenyl isocyanate has not been reported.
- ① p-Chlorophenyl N-(p-bromophenyl)carbamate: white pl. from $C_6H_6/EtOAc$, m.p. $196-197^{\circ}$ cor. (281). [From \bar{C} with p-bromobenzazide (281) in lgr. (281).]
- D p-Chlorophenyl N-(p-iodophenyl)carbamate; m.p. 214-215° (282). [From C with p-iodobenzazide (282) in lgr. (282).]
- ① p-Chlorophenyl N-(m-nitrophenyl)carbamate: white pl. from lgr., m.p. 136° u.c., 139° cor. (283). [From C with m-nitrobenzazide (283) or m-nitrophenyl isocyanate (283) in lgr. (283)]
- p-Chlorophenyl N-(p-nitrophenyl)carbamate: pale yel. rods from lgr., m.p. 196° cor.
 (284). [From C with p-nitropenzazide (284) in lgr. (284).]
- \bigcirc p-Chlorophenyl N-(3,5-dinitrophenyl)carbamate: yel. pl. from $C_6H_6/EtOAc$, m.p. 197-198° (285). [From \bar{C} with 3,5-dinitrophenzazide (285) in lgr. (285).]
- D p-Chlorophenyl N-(3,5-dinitro-4-methylphenyl)carbamate: pale yel. pl. from lgr., m.p. 206-207° u.c., 212-213° cor. (286). [From C with 3,5-dinitro-4-methylbenzazide (286) in lgr. (286).]
- p-Chlorophenyl N-(α-naphthyl)carbamate: m.p. 165-166° (287). [From C with α-naphthyl isocyanate in lgr. (287).]
- D p-Chlorophenyl N-(β-naphthyl)carbamate: pl. from lgr., m.p. 165-166° u.c., 169-170° cor. (288). [From C with β-naphthyl isocyanate (288) in lgr. (288).]
- p-Chlorophenyl N,N-diphenylcarbamate: m.p. 97° (289). [From C with N,N-diphenylcarbamyl chloride (289).]

3: 0485 DIMETHYL d,l- α,α' -DICHLOROSUCCINATE $C_6H_8O_4Cl_2$ Beil. II — (Dimethyl allo-dichlorosuccinate; COOCH₃ II₁-(267) dimethyl isodichlorosuccinate) H—C—Cl Cl—C—H

[For prepn. of \tilde{C} from d_l - α,α' -dichlorosuccinic acid (3:4711) in MeOH with H₂SO₄ at ord. temp. see (3); from dimethyl d_l -tartrate (1:2385) (1) or from dimethyl low-melting β -chloro- d_l -malate [Beil. III-438, III₂-(290)] (2) with SOCl₂ in pyridine see indic. refs.] \tilde{C} with dimethylaniline loses 1 HCl yielding (1) dimethyl chlorofumarate (3:6582).

3:0485 (1) Darzens, Séjourne, Compt. rend. 154, 1616 (1912). (2) Kuhn, Wagner-Jauregg, Ber. 61, 514 (1928). (3) Holmberg, Arkiv. Kemi, Mineral. Geol. 8, No. 2, 17, 33 (1920); Cent. 1921, I 820; C.A. 16, 2116 (1922).

3: 0490 2,5-DICHLOROBENZAL (DI)CHLORIDE
$$C_7H_4Cl_4$$
 Beil. V - 302 V_1 — $CHCl_2$ V_2 -(234)

Cryst. from CHCl₃; very eas. sol. org. solvents but spar. sol. in aq. — \bar{C} has faint but not disagreeable odor. — Volatile with steam.

[For prepn. of \bar{C} from 2,5-dichlorobenzaldehyde (3:1145) with PCl₅ (78% yield (1)) or with ClSO₃H in CHCl₃ (3) see indic. refs.; from 2,5-dichlorotoluene (3:6245) at b.p. with Cl₂ see (2).]

 \bar{C} on hydrolysis, e.g., by protracted refluxing (56 hrs.) with aq. + CaCO₃ (2), or by treatment with fumg. H₂SO₄ (3), yields 2,5-dichlorobenzaldehyde (3:1145). [For study of rate of hydrolysis in 50% alc. at 83.5° see (1).]

M.P. 43° (1)

Colorless cryst. from lt. pet.

[For prepn. of \bar{C} from α,ω -hexadecamethylene glycol [Beil. I₂-(565)] (m.p. 87-88° (1)) with SOCl₂ + dimethylaniline in C₆H₆ (60% yield) see (1); note that a little 1,16-dichlorohexadecane, cryst. from McOH, m.p. 47°, is also formed.]

3:0525 (1) Bennett, Gudgeon, J. Chem. Soc. 1938, 1679-1681.

[For prepn. of \bar{C} from p-chlorobenzoic acid (3:4940) with MeOH + HCl (2) or MeOH + H₂SO₄ (2) (6) see indic. refs.; from Ag \bar{A} + MeI in s.t. at 100° see (5); from p-chlorobenzoyl chloride (3:6550) with MeOH see (3).]

 $\bar{\mathbf{C}}$ on htg. with sirupy $\mathbf{H}_3\mathbf{PO}_4$ at 200° yields (7) p-chlorobenzoic acid (3:4940), dimethyl ether, and probably some p-chlorotoluene (3:8287).

C̄ added to 5-6 pts. very conc. HNO₃ at 0°, poured onto ice, yields (3) methyl 4-chloro-3-nitrobenzoate [Beil. IX-402], cryst. from MeOH, m.p. 83° (3).

[$\bar{\mathbf{C}}$ with Na + methyl acetate condenses giving (60% yield (6)) methyl p-chlorobenzoylacetate, b.p. 172° at 12 mm., m.p. 36-37° (6); this prod. with excess phenylhydrazine in alc. + AcOH gives on htg. 3-(p-chlorophenyl)-1-phenylpyrazolone-5, or. eryst. from AcOH, m.p. 140° (6); corresp. prod. from p-nitrophenylhydrazine, m.p. 200-205° (6).]

 \bar{C} on hydrolysis (Sap. Eq. = 170.5) yields methyl alcohol (1:6120) + p-chlorobenzoic acid (3:4940). [For studies of hydrolysis under various cond. see (2) (4).] — For the amide, anilide, p-toluidide, and other derivs, corresp. to \bar{C} see p-chlorobenzoic acid (3:4940).

3:0535 (1) Jaeger, Z. Krist. 42, 22 (1907). (2) Kellas, Z. physik Chem. 24, 243-252 (1897). (3) Montagne, Rec. trav. chim. 19, 55-56, 61 64 (1900). (4) Jones, McCombie, Scarborough, J. Chem. Soc. 123, 2694-2697 (1923). (5) Emmelling, Rec. 8, 883 (1875). (6) Wahl, Rolland, Ann. chim. (10) 10, 9-12, 15-17 (1928). (7) Raikow, Tischkow, Chem. Zlq. 29, 1209 (1905). (8) Berger, Rec. trav. chim. 43, 170 (1924). (9) Kahovec, Wagner, Monatsh. 74, 285 (1943).

3:0550 3,4-DICHLOROBENZALDEHYDE
$$C_7H_4OCl_2$$
 Beil. VII - 238 VII_1 -(134)

Colorless adds. from alc. (1), odor like benzaldehyde (2). — Eas. volatile with steam (2) (3).

[For preph. of C from 3,4-dichlorotoluene (3:6355) via chlorination to 3,4-dichlorobenzal

(di)chloride (3:6876) and hydrolysis of the latter with fumg. H₂SO₄ (5% SO₃) (36% yield (3)), conc. H₂SO₄ (4), or CaCO₃ + H₂O (40% yield (3)) see (2) (3) (4); for prepn. from 4-chloro-3-nitrobenzaldehyde via reduction, diazotization, etc., see (1).]

C with satd. aq. NaHSO₃ yields a cpd. C.NaHSO₃ (3). [Use in purification of C (3).]
C on oxidn. with KMnO₄ yields (2) 3,4-dichlorobenzoic acid (3:4925), m.p. 201-202° (3).
C with conc. aq. KOH undergoes Cannizzaro reactn. yielding 3,4-dichlorobenzyl alcohol, ndls. from aq., m.p. 38° (3), and 3,4-dichlorobenzoic acid (see above).

Č on nitration as specified (5) (4) gives (71% yield (4)) 3,4-dichloro-6-nitrobenzalde-hyde [Beil. VII₁-(144)], yel. pr. from C₆H₆, m.p. 73° (5). [This product with NH₄OH/AgNO₃ is oxidized (4) to 3,4-dichloro-6-nitrobenzoic acid, cryst. from C₆H₆, m.p. 165° (6).]

[For conversion of \bar{C} to 3,4-dichlorostyrene (7) (8) cf. (9) via reaction with MeMgI giving (73% yield (7)) 3,4-dichlorophenyl-methyl-carbinol (7) (8) and dehydration of latter with KHSO₄ (yields 83% (8), 64% (7)) see indic. refs.]

- 3,4-Dichlorobenzaldoxime (anti form): m.p. 114-115° (2), 118-119° (1). [The syn isomer, ndls. from alc., m.p. 120° rap. htg., is converted by fusion (2) to the anti form.]
 3,4-Dichlorobenzaldehyde phenylhydrazone: unrecorded.
- 1) 3 4-Dichlorobenzaldehyde p-nitrophenylhydrazone: or. ndls., m.p. 276-277° (1).
- --- 3,4-Dichlorobenzaldehyde 2 4-dinitrophenylhydrazone: unrecorded.
- 3,4-Dichlorobenzaldehyde semicarbazone: unrecorded.

M.P. B.P. (1) (2) 210.2-211.5° u.c. (18)
$$D_{-}^{25} = 1.4723$$
 (8) (43-44° (17) 209-211° (6) (11) $n_{D}^{25} = 1.1729$ (8) (43° (3) (4) 209-210° (4) (16) (18) 206-208° u.c. at 753 mm. (7) (42° (5) 106.2-107.6° at 14-16 mm. (3) (41-42° (11)

Colorless ndls. from C_6H_6 . — \bar{C} has unpleasant and persistent odor suggesting iodoform (1) (for study of strength of odor of aq. solns. of \bar{C} see (1)). — \bar{C} is spar. sol. aq. (100 g. aq. at 20° dis. 0.45 g. \bar{C}), but is eas. sol. alc., ether, C_6H_6 , or CHCl₃. — \bar{C} is volatile with steam; note, however, that from alk. soln. \bar{C} is not volatile with steam (dif. and sepn. from 2-chlorophenol (3:5980) or 4-chlorophenol (3:0475) (9)), although \bar{C} is volatile with steam from aq. solns. contg. PbCO₃ (dif. and sepn. of \bar{C} from 2,4,6-trichlorophenol (3:1673) (9)). — Note that comml. \bar{C} often contains 2,4,6-trichlorophenol, and that \bar{C} prepd. by chlorination of phenol may cont. 2,6-dichlorophenol (3:1595).

[For prepn. of \bar{C} from p-chlorophenol (3:0475) or o-chlorophenol (3:5980) with Cl_2 (1 mole) in AcOH soln. (80% yield) see (6); from phenol (1:1420) with Cl_2 (2 moles) diluted with CO_2 in AcOH and under these cond. giving exclusively \bar{C} see (7).]

[For formn. of \bar{C} (together with other prods.) from phenol (1:1420) with Cl₂ (2 moles) (2) (1) (4) (10), with Cl₂ (2 moles) in alk. soln. (11) (12), with N,N'-dichlorourea in HCl soln. (13), or with SO₂Cl₂ (14) see indic. refs.; for formn. of \bar{C} from salicylic acid (1:0780) in excess aq. KOH with Cl₂ see (15); from 3,5-dichloro-2-hydroxybenzoic acid (3,5-dichloro-salicylic acid) (3:4935) on distn. with lime see (16) (17); from 2,6-dichloro-3-hydroxybenzaldehyde (3:4160) in excess 50% aq. KOH on htg. at 80° (94% yield) see (5).]

Nuclear substitution of \bar{C} . \bar{C} in AcOH with Br₂ (1 mole) (7) (18), or in 50% AcOH with Br₂ (1 mole) in AcOH (19), yields 6-bromo-2,4-dichlorophenol, ndls. from C_6H_6 or lt. pet., m.p. 68-69° (19), 68° (7) (18), b.p. 268° dec. (18), 204° at 19 mm. (19), 198° at 15 mm. (19), 192° at 12 mm. (19) (corresp. methyl ether, m.p. 65° (7); corresp. 2,4-dinitrophenyl ether, yel. lfts. from alc., m.p. 140-141° (19); corresp. p-toluenesulfonate, m.p. 82-83° (19)). — [This 6-bromo-2,4-dichlorophenol with excess Br₂ in pres. of Fe powder and absence of aq. yields (20) 2,4-dichloro-3,5,6-tribromophenol, cryst. from AcOH, m.p. 209° (20) (corresp. methyl ether, m.p. 143-144° (20), corresp. benzoate, m.p. 202° (20)).]

Č in aq. NaOH with I₂ (1 mole) in aq. KI yields (7) 2,4-dichloro-6-iodophenol, ndls. from dil. alc., m.p. 63° (7) (corresp. methyl ether, m.p. 35°, b.p. 278-285° u.c. (7)).

C on nitration by soln. in cold fumg. HNO₃, subsequently poured into aq. (4) cf. (21), yields 2,4-dichloro-6-nitrophenol [Beil. VI-241, VI₁-(122)], yel. cryst. from alc., m.p. 121-122° (4), 124° (22).

Condensation reactions involving nuclear hydrogens. [\tilde{C} with formalin (1:0145) + conc. HCl + conc. H₂SO₄ in pres. of stream of HCl gas at 35-40° (23), or \tilde{C} with trioxymethylene + AcOH/H₂SO₄ at 50° (24), gives (54% yield (23)) 6,8-dichlorobenzodioxane-1,3, volatile with steam, cryst. from MeOH, m.p. 111° (24), 109-109.5° (23). — \tilde{C} with formalin (1:0145) + conc. HCl in stream of HCl gas at 50° for 36 hrs. gives (72% yield (23)) 3,5-dichloro-2-hydroxybenzyl chloride, ndls. from pet. eth., m.p. 82-84° (23); this prod. on hydrol. with aq. at 50° yields (23) 3,5-dichloro-2-hydroxybenzyl alc., ndls. from aq., m.p. 80-81°, also formed as by-product of the dichlorobenzodioxane mentioned above.]

[C with methylal (1:0105), methylene diacetate, or methylene (di)iodide in pres. of conc. H₂SO₄ or ZnCl₂ (25) or \bar{C} + formalin (1:0145) with AcOH/H₂SO₄ (26) yields methylene-bis-(2,4-dichlorophenol) (2,2'-dihydroxy-3,5,3',5'-tetrachlorodiphenylmethane); for use of this prod. as mothproofing cpd., antiseptic, and seed disinfectant see (25) (26) (27) (28) (29) (30). — Note, however, that \bar{C} (as Na salt) with methylene (di)chloride (3:5020) at 120-140° in s.t. for 6 hrs. gives (24) bis-(2,4-dichlorophenoxy)methane, m.p. 98°. — \bar{C} with SCl₂ or S₂Cl₂ + AlCl₃ in CS₂ or CCl₄ yields (31) 2,2'-dihydroxy-3,5,3',5'-tetrachlorodiphenyl sulfide, m.p. 188°. — For condens. of \bar{C} with benzaldehyde o- (or p-) sulfonic acids and use of products as mothproofing agts. see e.g. (26).]

[\bar{C} with phthalic anhydride (1:0725) + AlCl₃ at 150° for 2 hrs. yields (36) cf. (37) (38) 2-(3',5'-dichloro-2'-hydroxybenzoyl)benzoic acid, colorless lfts. from alc., m.p. 204° cor. (36), which with conc. H₂SO₄ ring-closes to 2,4-dichloro-1-hydroxyanthraquinone, yel. ndls. from C₆H₆, m.p. 242° (36), 241-242° (39). — \bar{C} with 4,5-dichlorophthalic anhydride (3:4830) + fumg. H₂SO₄ + H₃BO₃ at 195° yields (40) 2,6,7-trichloro-1,4-dihydroxyanthraquinone (2,6,7-trichloroquinizarin).]

Reactions of the phenolic group of \bar{C} (see also under \oplus below). \bar{C} behaves as a weak acid: \bar{C} is sol, in aq. alk, but largely pptd, by CO_2 . — Dissoc. const. at 25° in aq. is 31. \times 10⁻⁷ (41) cf. (42).

[For study of bactericidal prop. of \bar{C} see (43); for use as insecticide in paper see (44); for prepn. and use of metal complexes as antiseptics see (45).]

[Č with alkali metals gives corresp. alk. 2,4-dichlorophenolates: K 2,4-dichlorophenolate with CO₂ at 140° yields (15) 3,5-dichloro-2-hydroxybenzoic acid (3,5-dichlorosalicylic acid) (3:4935).]

- [\bar{C} with ethyl α -methylacetoacetate (1:1712) + P₂O₅ gives (14.5% yield (46)) 6,8-dichloro-2,3-dimethylchromone [Beil. XVII₁-(177)], ndls. from alc., m.p. 141°.]
- [\bar{C} in 20% aq. KOH htd. 2 hrs. at 100° with Me₂SO₄ (22) cf. (1) yields 2,4-dichlorophenyl methyl ether (2,4-dichloroanisole) [Beil. VI-189, VI₁-(103)], b.p. 232-233° cor. at 743.5 mm.; m.p. 27-28° (47). $-\bar{C}$ with EtI + K₂CO₃ in acetone refluxed 6-8 hrs. gives (90% yield (48)) 2,4-dichlorophenyl ethyl ether (2,4-dichlorophenetole), oil, b.p. 235-236° (48), 236-237° (4) (for study of cleavage of this ether with HBr/AcOH see (48), for study of rate of formation see (49)). $-\bar{C}$ with allyl bromide + K₂CO₃ in acetone yields (50) allyl 2,4-dichlorophenyl ether, b.p. 144-145° at 25 mm. (50).]
 - 2,4-Dichlorophenyl acetate: oil, b.p. 244-245° (4), 167-168° at 80 mm. (51). [From C with AcCl refluxed 40 min. (86% yield (51)); this ester with AlCl₃ at 170° for 40 min. undergoes Fries rearr. giving (75% yield (51)) 3,5-dichloro-2-hydroxyacetophenone, m.p. 95-96° (51).]
 - ② 24-Dichlorophenyl benzoate: cryst. from alc., m.p. 96.5° (5), 96° (1), 97° [Beil. IX-117]. [From C in dil. aq. NaOH shaken with BzCl (5) cf. (1).] [For study of nitration of this ester see (6).]
 - **② 2,4-Dichlorophenyl** *m*-nitrobenzoate: ndls. from alc., m.p. 115-116° (6). [From $\ddot{\mathbf{C}}$ + *m*-nitrobenzoyl chloride in dil. aq. alk.; for study of its nitration see (6).]
 - ---- 2,4-Dichlorophenyl p-nitrobenzoate: unreported.
 - ---- 2,4-Dichlorophenyl 3,5-dinitrobenzoate: unreported.
 - ---- 2,4-Dichlorophenyl benzenesulfonate: unreported.
 - 2,4-Dichlorophenyl p-toluenesulfonate: pr. from alc., m.p. 125° (6).
 - Q 2,4-Dichlorophenyl benzyl ether: pr. from alc., ether, or pet. eth., m.p. 62° (52), 61-62° (53), 60° (54), 59.0-59.5° (55). [From \(\tilde{\mathbb{C}}\) + benzyl chloride (3:8535) + NaOEt in hot alc. (53), or from Na salt of \(\tilde{\mathbb{C}}\) + benzyl chloride in MeOH (55); note, however, that Na salt of \(\tilde{\mathbb{C}}\) with benzyl chloride in toluene at 160° for 5 hrs. undergoes instead nuclear alkylation yielding (55) 2,4-dichloro-6-benzylphenol (3,5-dichloro-2-hydroxydiphenylmethane), cryst. from pet. eth., m.p. 77.0-77.5° (55).]
 - ② 2,4-Dichlorophenyl p-nitrobenzyl ether: ndls. from ether, m.p. 148-150° (53).
 - 2,4-Dichlorophenyl 2,4-dinitrophenyl ether: lfts. from AcOH, AcOH/EtOH, or EtOH, m.p. 119° (56), 118-119° (6), 118° (57). [From Na or K salt of C + 2,4-dinitrochlorobenzene refluxed in alc. (56) (6) (57).]
 - **D** 2,4-Dichlorophenoxyacetic acid (3:4095): cryst. from C_6H_6 , m.p. 138° (58), Neut. Eq. = 221.0. [From \bar{C} + chloroacetic acid in slight excess aq. NaOH, refluxed and then acidified (87% yield (58)); for studies on use of this prod. as plant hormone see (59).]
 - 2,4-Dichlorophenyl N-phenylcarbamate: unreported.
 - 2,4-Dichlorophenyl N(p-iodophenyl)carbamate: m.p. 182-183° (61). [From C + p-iodobenzazide in hot lgr. (61).]
 - **D 2,4-Dichlorophenyl** N-(p-bromophenyl)carbamate: rods from lgr./AcOEt, m.p. 169° cor. (62). [From $\tilde{C}+p$ -bromobenzazide in hot lgr. (62).]
 - **D 2,4-Dichlorophenyl** N-(p-nitrophenyl) carbamate: yel. pl. from lgr./EtOAc, m.p. 205° cor. (62). [From $\bar{C} + p$ -nitrobenzazide in hot lgr. (63).]
 - ② 2,4-Dichlorophenyl N-(3,5-dinitro-4-methylphenyl)carbamate: or.-yel. pr. from lgr. or EtOAc, m.p. 153° u.c., 157° cor. (64). [From C + 3,5-dinitro-4-methylbenzazide in hot lgr. (64).]
 - 2.4-Dichlorophenyl $N-(\alpha$ -naphthyl)carbamate: unreported.
 - D 2,4-Dichlorophenyl N-(β-naphthyl)carbamate: pl. from lgr., m.p. 162° u.c., 166° cor.
 (65). [From C + β-naphthyl isocyanate (or azide) in hot lgr. (65).]

3: 0563 1,8-DICHLOROPROPANONE-2
$$(\alpha,\alpha'-Dichloroacetone, CH_2-C-CH_2 sym.-dichloroacetone, Cl $(\alpha,\alpha'-Dichloroacetone, CH_2-C-CH_2 sym.-dichloroacetone, Cl $(\alpha,\alpha'-Dichloroacetone, CH_2-C-CH_2 sym.-dichloroacetone, Cl $(\alpha,\alpha'-Dichloroacetone, CH_2-C-CH_2 sym.-dichloroacetone, Cl $(\alpha,\alpha'-Dichloroacetone, CH_2-C-CH_2 sym.-dichloroacetone, CH_2-C-CH_2 sym.-dichloroacetone, CH_2-C-CH_2 sym.-dichloroacetone, CH_2-C-CH_2 sym.-dichloroacetone, CH_2-C-CH_2 sym.-dichloroacetone, CH_2-C-C-CH_2 sym.-dichloro$$$$$$

Colorless tbls. or ndls. volatile even at ord. temp. — Vapors are lachrymatory; liquid blisters skin. — Appreciably sol. in aq. especially on warming, eas. sol. alc., ether. — Volatile with steam.

[For prepn. of \bar{C} from 1,3-dichloropropanol-2 (glycerol α -dichlorohydrin) (3:5985) by oxidn. with Na₂Cr₂O₇ + H₂SO₄ (68-75% yield {10}), with K₂Cr₂O₇ + H₂SO₄ (1) {2} {4} (6) (7) {8} (9) {11} (generally poorer yields) see indic. refs. (note also that b.p. of \bar{C} is very close to that of the precursor 1,3-dichloropropanol-2 (3:5985), a fact which leads to some doubt as to the true yield of \bar{C} in certain of the older reports); for prepn. of \bar{C} from acetone (1:5400) with Cl₂ directly (12), in pres. of I₂, FeCl₃, or SbCl₅ (yield: 28% \bar{C} accompanied by 48.6% unsym.-dichloroacetone (3:5430) {13}), in pres. of NiCl₂ at 70° (other prods. are also formed {14}), or in pres. of aq. + CaCO₃ (yield: 10% \bar{C} accompanied by other prods. (16)) {4} (15), see indic. refs.]

[For prepn. of \bar{C} from epichlorohydrin (3-chloro-1,2-epoxypropane) (3:5358) with S_2Cl_2 (yield: 33% \bar{C} accompanied by 67% 1,3-dichloropropanol-2 (3:5985) (17)), from ethyl γ -(α)-chloro- α (γ)-ethoxyacetoacetate (18) or from ethyl α , γ -dichloracetoacetate (19) by ketonic cleavage with HCl, from allene (propadiene) (20) or 1,2-dichloropropene-2 (21) with HOCl, or from 1,3-diiodoacetone on digestion with AgCl (22) cf. (3) see indicrefs.]

 $[\bar{C}]$ on reduction with yeast gives (53% yield (2)) 1,3-dichloropropanol-2 (3:5985), b.p. 178° (2). — \bar{C} with Zn + AcOH does *not* give acetone but yields (23) a gas formerly supposed to have been cyclopropanone (since it yielded with semicarbazide a semicarbazone, m.p. 156° (23)) although in the light of later work (24) (25) (26) this now appears very doubtful. — For polarographic study of reduction potential of \bar{C} see (27).]

 $\bar{\bf C}$ with aq. alk. presumably yields 3-chloropropanone-2-ol-1 [Beil. I-823] and/or propanone-2-diol-1,3 (dihydroxyacetone) [Beil. I-846, I₁-(428), I₂-(889)] since $\bar{\bf C}$ readily reduces Fehling's soln. (28).

 \bar{C} with satd. aq. NaHSO₃ soln. yields a NaHSO₃ cpd. which seps. with $2\frac{1}{2}$ H₂O (1), 3 H₂O (7). — \bar{C} with aq. K₂SO₃ soln. yields (30) corresp. salt of acetone- α , α '-disulfonic acid [Beil. IV₂-(530)].

[C with KOAc (slightly more than 1 mole) in boilg. AcOH gives (48% yield (29)) chloro-acetylmethyl acetate, b.p. 112-114° at 16 mm. (29). — C with K benzoate refluxed in alc. yields (23) 1,3-dibenzoyloxyacetone, long ndls. from alc., but m.p. not reported.]

[C in dry McOH treated with HCl gas gives (84.5% yield (31)) 1,3-dichloroacetone dimethylketal, cryst. from McOH, m.p. 81.5° (31); C in abs. EtOH similarly treated gives (smaller yield (31)) 1,3-dichloroacetone diethylketal, m.p. 28° (31). — For reactn. of C with ethylene glycol see (32).]

[\bar{C} with equal wt. ethyl mercaptan gives (34% yield (33)) 1,3-bis-(ethylmercapto)-propanone-2, b.p. 117-121° at 15 mm. (33) (corresp. semicarbazone, m.p. 98-99°), but \bar{C} with large excess ethyl mercaptan (4 wt. pts.) gives also 1,2,2,3-tetra(ethylmercapto)-propane, oil (33). — \bar{C} (1 mole) with benzyl mercaptan (2 moles) in alc. NaOH yields (34) 1,3-bis-(benzylmercapto)propanone-2, oil, which on oxidn. in acid soln. with KMnO4 gives the corresp. disulfone, ndls. from alc., m.p. 182° (34).] — [For reactn. of \bar{C} with alk. sulfides and/or polysulfides in prepn. of resins see (37).]

Č with KI even at room temp. (7) yields 1,3-diiodoacetone, pr. from acetone, m.p. 61°. [For reaction of \bar{C} with MeMgBr as means of prepn. of sym.-dichloro-ter-butyl alcohol (3:5977) see the latter.]

[Č with excess conc. aq. or liq. HCN in alc. at 30° for 12 hrs. (11) cf. (35) or with 25% HCN in pres. of a little NH₄OH (36) yields $\beta_{,}\beta'$ -dichloro- α -hydroxyisobutyronitrile (not isolated), which on hydrolysis with HCl (11) (35) (36) gives the corresp. acid, $\beta_{,}\beta'$ -dichloro- α -hydroxyisobutyric acid, in p. 91–92° (11).]

[C with diazotized aniline in pres. of NaOAc yields (3) 1,3-dichloro-1-(benzeneazo)-propanone-2, red-or. cryst. from hot alc., m.p. 156-157° (3); for corresp. homologs using

diazotized o-toluidine or p-toluidine see (3).]

[C with equiv. molar quant. thioacetamide in acetone or alc. followed by htg. with ZnCl₂ (38) (39) gives 4-(chloromethyl)-2-methylthiazole hydrochloride (free base is oil, b.p. 65-67° at 3 mm. (38) (39)); for polymerization of this prod. by htg. see (38). — C with thiobenzamide in acetone followed by htg. of resultant intermediate with HCl in acetone gives 4-(chloromethyl)-2-phenylthiazole hydrochloride (yields: 80-81% (40) (41)) (corresp. free base, m.p. 51° (40), 48.2-51.2° cor. (41)); for reactns. of this prod. see (41). — For analogous reactn. of C with many other substituted thiobenzamides to give corresp. substituted thiazoles see (40) (39).]

 $[\bar{C}$ with equiv. molar amt. carbamyl chloride in dry ether at room temp. for 15 min. is claimed (2) to yield β,β' -dichloroisopropyl carbamate ("Aleudrin"), white cryst. from alc., m.p. 80-81° (2); \bar{C} with 2 molar equivs. of carbamyl chloride similarly treated is claimed (2) to yield β,β -dichloroisopropyl allophanate, cryst. from 60% alc., m.p. 182° (2); note, however, that in view of the facts that the \bar{C} used in the cited work was obtd. from 1,3-dichloropropanol-2, that the b.p.'s of this precursor and \bar{C} are almost identical, and that the \bar{C} employed was purified only by distillation, the indicated esters may have been due to the presence of unoxidized starting material.]

- D 1,3-Dichloropropanone-2 semicarbazone: m.p. 120° (23). [Note that this prod. is very sensitive to heat (care in recrystn. from aq. or C₆H₆) and is also changed by stdg. in solution (23).]
- ① 1,3-Dichloropropanone-2 4-(p-bromophenyl)semicarbazone: ndls. from alc., m.p. 196° cor. dec. (42). [From C + 4-(p-bromophenyl)semicarbazide in alc. refluxed for 12 hrs. (42).]
- © Condensation product (C₁₇H₁₉O₄N₃SCl₂) of C with N-methyl-3-(carbohydrazido)-pyridinium p-toluenesulfonate: cryst. from 1:1 alc./ether, m.p. 115° cor. (43). [From C with nicotinic acid hydrazide metho-p-toluenesulfonate in abs. alc. on refluxing for 15 mins. (43).]

3: 0565 PHENYL CHLOROACETATE C₈H₇O₂Cl Beil. VI - 153 VI₁-(87) ClCH₂.CO.C VI₂-(154) M.P. B.P. $n_{\rm D}^{44} = 1.5146 (9)$ 45° (1) (2)230-235° $D_4^{44} = 1.2202 (9)$ 44-45° 155° (3) at 65 mm. (7) 44° (5) 123-126° at 14 mm. (2) 43° (7) 40.2° (6)

Ndls. or lfts. from alc. — Insol. aq.; eas. sol. alc., ether.

[For prepn. of \bar{C} from phenol (1:1420) with chloroacetyl chloride (3:5235) on htg. alone (7) (6) (3), in ether soln. + pyridine (2), or with AlCl₃ in CS₂ (1) see indic. refs.; with chloroacetic acid (3:1370) + P_2O_5 in CHCl₃ (8) or on htg. with POCl₃ or ZnCl₂ (5) see (8) (5).]

 \bar{C} hydrolyzes rather easily, even slowly on stdg. in moist air (3). \bar{C} on mere refluxing for $\frac{3}{4}$ hr. with abs. alc. or with alc. NaOEt undergoes trans-esterification yielding (3) ethyl chloroacetate (3:5700) and phenol (1:1420).

C in ether treated with NH₃ gas reacts vigorously yielding (3) NH₄ phenolate (sol. in aq.) and chloroacetamide (insol. aq.), m.p. 118° (3).

 \bar{C} with aniline (2 moles) at 80° for 1 hr. gives (4) aniline hydrochloride (sol. in aq.) + phenyl N-phenylaminoacetate [Beil. XII-471] pptd. from alc. by addn. of aq., m.p. 82-83° (4). [Note that \bar{C} on boilg. with aniline yields (4) N-phenylaminoacetanilide (N-phenyl-glycine anilide) [Beil. XII-556], m.p. 111-112° (4).]

C with phenylhydrazine (2 moles) at 50° for ¼ hr. yields (4) phenyl β-phenylhydrazinoacetate [Beil. XV-321], lfts. from C₆H₆ or from alc. by addn. of aq., m.p. 93-94° (4).

C htd. with AlCl₃ for 5 hrs. at 130-140° gives (10) o-hydroxyphenacyl chloride (vol. with steam), m.p. 74°, + p-hydroxyphenacyl chloride (not vol. with steam), m.p. 148°.

 \bar{C} + equal wt. pyridine htd. at 100° gives (1) cpd. $\bar{C}.C_5H_5N.5H_2O$, ndls. from alc., m.p. 165-168° dec. (11), cf. (4).

3: 0572 DI-(β-CHLOROETHYL) OXALATE

C₆H₈O₄Cl₂ Beil. S.N. 170

94

CO.O.CH₂.CH₂Cl CO.O.CH₂.CH₂Cl

M.P. 45° (1) B.P. 132° at 3 mm. (2)

[For prepn. of C from ethylene chlorohydrin (3:5552) with anhydrous oxalic acid (1:0535) by satn. with HCl gas and htg. at 100° see (1).]

[Č with Me₃N in C₆H₆ gives (1) "oxalylcholine chloride," C₁₂H₂₆O₄N₂Cl₂, very hygroscopic cryst. ndls. (chloroaurate, m.p. 256.5° dec.).]

 $[\bar{C} + C_6H_6 + AlCl_3 \text{ gives (2) bibenzyl } (1:7149) + \tan .]$

3:0572 (1) Contardi, Ercoli, Atti IX congresso intern. chim. Madrid 9, V, 163-173 (1934); Cent. **1936**, II 3903-3904; C.A. **31**, 1764 (1937). (2) Markarov-Zemlyanskii, Korshak, Savenkov, J. Gen. Chem. (U.S.S.R.) **11**, 331 334 (1941); Cent. **1942**, I 993; C.A. **35**, 5883 (1941).

3:0580 3,4,5-TRICHLOROTOLUENE

Readily volatile with steam.

[For prepn. of C from 3,5-dichloro-4-aminotoluene [Beil. XII-990] or from 4,5-dichloro-3-aminotoluene [Beil. XII-872] via diazotization and use of Cu₂Cl₂ reactn. see (1); from potassium salt of 3,4,5-trichlorotoluenesulfonic acid-2 by hydrolysis with strong H₂SO₄ see (2).]

[\bar{C} with Cl_2 in pres. of Al/Hg yields (3) 2,3,4,5-tetrachlorotoluene (3:2710), m.p. 97-98° (3).]

C on mononitration with cold fumg. HNO₃ (1) yields 3,4,5-trichloro-2-nitrotoluene [Beil. V-333], pr. from alc., m.p. 81-82° (1); C on dinitration with a mixt. of 6 pts. fumg. HNO₃ and 4 pts. conc. H₂SO₄ (1) yields 3,4,5-trichloro-2,6-dinitrotoluene [Beil. V-346], ndls. from AcOH, m.p. 163-164° (1).

 \bar{C} on oxidn. with dil. HNO3 in s.t. at 130° readily yields (1) 3,4,5-trichlorobenzoic acid (3:4920), m.p. 203° (1).

3: 0610 2,3,5-TRICHLOROTOLUENE CH_3 $C_7H_5Cl_3$ Beil. V - 299 V_1 — V_2 —

M.P. 45-46° (1) B.P. 229-231° at 757 mm. (1)

[For prepn. of \bar{C} from 3,5-dichloro-2-aminotonuene [Beil. XII-837] or from 2,5-dichloro-3-aminotoluene [Beil. XII-872] via diazotization and use of CuCl₂ reactn. see (1); for formn. of \bar{C} from 3,5-dichlorotoluene (3:6310) with Cl₂ in pres. of Al/Hg see (2).]

[C with Cl2 in pres. of Al/Hg yields (3) 2,3,5,6-tetrachlorotoluene (3:2575).]

 \bar{C} on mononitration with cold fumg. HNO₃ (1) yields 2,3,5-trichloro-4(or 6)-nitrotoluene [Beil. V-333], ndls. from alc. or AcOH, m.p. 58-59° (1); \bar{C} on dinitration with 6 pts. fumg. HNO₃ + 4 pts. conc. H₂SO₄ yields 2,3,5-trichloro-4,6-dinitrotoluene [Beil. V-345], ndls. from alc. + AcOH, m.p. 149-150° (1).

 \bar{C} on oxidn. with dil. HNO₃ in a s.t. at 140° yields (1) 2,3,5-trichlorobenzoic acid (3:4485), m.p. 162° (1).

3:0610 (1) Cohen, Dakin, J. Chem. Soc. 81, 1329-1331 (1902). (2) Cohen, Dakin, J. Chem. Soc. 81, 1343-1344 (1902). (3) Cohen, Dakin, J. Chem. Soc. 85, 1284 (1904).

M.P. 46° (1) (2) B.P. 265° (2) 45° (3) 162–163° at 28 mm. (3)

[For prepn. of \bar{C} from m-cresol (1:1730) in aq. alk. with excess Cl_2 (3) or from m-cresol with Cl_2 in the dark (2) see indic. refs. (note that m-cresol with Cl_2 in sunlight yields (2)

3,5,6-trichloro-2-methylbenzoquinone-1,4 [Beil. VII-651, VII₁-(354)], m.p. 238° (2)); from 2,4-dichloro-3-methylphenol (3:1205), from 2,6-dichloro-3-methylphenol (3:0150), and from 4.6-dichloro-3-methylphenol (3:1745) in CHCl₃ with Cl₂ see (1).]

[Č with PCl₅ yields (2) both tris-(2,4,6-trichloro-3-methylphenyl) phosphate, m.p. 230° (2), and bis-(2,4,6-trichloro-3-methylphenyl) phosphate, m.p. 94.5° (2); for study of Hg, Sb, and Bi derivs, of Č see (2).

 $[\tilde{C}$ on sulfonation with fumg. H_2SO_4 (50% SO_3) at 50° yields (4) a monosulfonic acid; for condens, of \tilde{C} with benzaldehyde-p-sulfonic acid and use of prod. as motheroofing agent see (5); for study of use of Na or K salts of \tilde{C} as wood impregnants (preservatives) see (6).]

Č with aqua regia at 100° for 1½ hrs. gives (25% yield (3)) 3,5,6-trichloro-2-methyl-

benzoquinone-1,4 (see above), m.p. 233° (3).

[C in aq. alk. with Me₂SO₄ yields (2) corresp. methyl ether, ndls. from alc., m.p. 46°, b.p. 258° (2); C in aq. alk. with Et₂SO₄ yields (2) corresp. ethyl ether, ndls. from alc., m.p. 35.5°, b.p. 266° (2).]

- --- 2,4,6-Trichloro-3-methylphenyl acetate: m.p. 35°, b.p. 270° (2).
- **② 2,4,6-Trichloro-3-methylphenyl benzoate:** fine prismatic pl. from alc., m.p. 53° (1). [From \bar{C} with BzCl in pyridine (1).]
- **② 2,4,6-Trichloro-3-methylphenyl benzenesulfonate:** prismatic pl. from alc., m.p. 121° (1). [From Č with benzenesulfonyl chloride in pyridine (1).]
- **D 2,4,6-Trichloro-3-methylphenyl** p-toluenesulfonate: prismatic pl. from alc., m.p. 92-93° (1). [From Č with p-toluenesulfonyl chloride in pyridine (1).]

3:0625 2.3.6-TRICHLOROTOLUENE

M.P. 45-46° (1) 41-42° (2)

White ndls, from alc.

[For prepn. of \bar{C} from 2,6-dichloro-3-aminotoluene [Beil. XII-872] via diazotization and use of Cu_2Cl_2 reactn. see (1); from p-toluenesulfonyl chloride via chlorination, hydrolysis to acid, and subsequent hydrolytic cleavage of the sulfonic acid radical see (3) (2); for formn. of \bar{C} together with other prods. from 2,5-dichlorotoluene (3:6245) or 2,6-dichlorotoluene (3:6270) with Cl_2 in pres. of Al/Hg see (4).

[C with Cl₂ in pres. of Al/Hg yields (5) 2,3,5,6-tetrachlorotoluene (3:2575).]

Č on mononitration by soln. in cold fumg. HNO₃ yields (1) 2,3,6-trichloro-5-nitrotoluene [Beil. V-333], ndls. from alc., m.p. 57-58° (1); Č on dinitration, e.g., with 6 pts. fumg. HNO₃ + 4 pts. conc. H₂SO₄ (1), yields 2,3,6-trichloro-4,5-dinitrotoluene [Beil. V-346], pr. from AcOH, m.p. 140-142° (1), 140-141° (6).

C on oxidn. with dil. HNO3 in s.t. at 140° yields (1) 2,3,6-trichlorobenzoic acid (3:4500), m.p. 164°.

3:0625 (1) Cohen, Dakin, J. Chem. Soc. 81, 1331-1332 (1902). (2) Austin, Johnson, J. Am. Chem. Soc. 54, 658 (1932). (3) Geigy Co., Ger. 210,856, June 16, 1909; Cent. 1909, II 79. (4) Ref. 1, pp. 1342-1343. (5) Cohen, Dakin, J. Chem. Soc. 85, 1284 (1904). (6) Qvist, Holmberg, Acta Acad. Aboensis Math. Phys. 6, No. 14, 3-28 (1932); Cent. 1932, 2816; C.A. 27, 5726-5727 (1933).

Cryst. from CCl4; spar. sol. alc.; eas. sol. ether, CS2, lgr., or 90% AcOH; sublimes.

[For prepn. of \bar{C} from 3,5-dichloro-2-nitroaniline [Beil. XII-733] via diazotization and use of Cu₂Cl₂ reactn. (note that the nitro group is also replaced by chloride) in 83% yield (4) see (4) (5); from 2,3,4-trichloroaniline [Beil. XII-626] via diazotization and use of Cu₂Cl₂ reaction see (7) (6) cf. (1); from 1,2,3-trichlorobenzene (3:0990) with Cl₂ in CCl₄ in pres. of Al/Hg see (7); for formn. of \bar{C} as by-prod. of actn. of conc. HNO₃ on acet-2,4-dichloroanilide see (2).

[For use of C in mixts. of dielectric liquids see (8).]

[For behavior of \bar{C} with liq. Cl_2 yielding addn. products see (9).]

[For behavior of C with NaOMe see (4) (10).]

 \bar{C} on mononitration by warming with HNO₃ (D=1.52) (1) yields 1,2,3,4-tetrachloro-5-nitrobenzene [Beil. V-247], m.p. 64.5° (1), 62.0-63.5° (7), 66-67° (11); this prod. on further nitration by boilg. 2 hrs. with 10 pts. mixed HNO₃ (D=1.52) + conc. H₂SO₄ yields 1,2,3,4-tetrachloro-5,6-dinitrobenzene, m.p. 151° (11).

3: 0670 2,4'-DICHLOROBIPHENYL C₁₂H₈Cl₂ Beil. S.N. 479

M.P. 46° (1) B.P. 191° at 30 mm. (2)

Cryst from alc. (1); sol. in C_6H_6 or AcOH (1).

[For prepn. of C from 2-amino-4'-chlorobiphenyl (2), from 4-amino-2,4'-dichlorobiphenyl (1), or 2,4'-diaminobiphenyl (1) by appropriate diazo reactions see (1) (2).]

 \bar{C} on oxidn. with $CrO_3 + AcOH$ yields (2) p-chlorobenzoic acid (3:4940), m.p. 232° (2).

3:0670 (1) Finzi, Bellavita, Gazz. chim. ital. 64, 339 (1934). (2) de Crauw, Rec. trav. chim. 56, 776-777 (1931).

3:0685 2,4-DICHLOROBIPHENYL
$$C_{12}H_8Cl_2$$
 Beil. V — $V_1-V_2-(483)$

Pale yel. cryst. (1).

[For prepn. of C from 3-amino-4-chlorobiphenyl (3) or from 4-amino-3-chlorobiphenyl (1) via appropriate diazo methods see (1) (3).]

C htd. with aq. alk. for 3 hrs. at 290-300° yields (4) phenylpyrocatechol (3,4-dihydroxy-biphenyl) (1:1576), m.p. 144 8-145.2° (4); diacetate, m.p. 77.5-78° (4).

C on oxidn. with CrO₃ + AcOII yields (1) (3) 3,4-dichlorobenzoic acid (3:4925), m.p. 198° (3), 200° (1).

3:0685 (1) Scarborough, Waters, J. Chem. Soc. **1926**, 560. (2) Zerweck, Schutz (to General Aniline and Film Corp.), U.S. 2,280,504, Apr. 21, 1942, C.A. **36**, 5658 (1942). (3) Blakey, Scarborough, J. Chem. Soc. **1927**, 3007. (4) Harvey (to E R. Squibb and Sons), U.S. 1,952,755, March 27, 1934; Cent. **1934**, II 1846; C.A. **28**, 3426 (1934).

Strong camphoraceous odor! — Cryst. from ice-cold lt. pet. ether (3) (2). — Volatile with steam (2).

[For prepn. from 4-chloro-3-aminotolucne (2-chloro-5-methylaniline) [Beil. XII-871] via diazo reaction see (1) (2) (4); from 6-amino-m-cresol (2-amino-5-methylphenol) [Beil. XIII-590] see (1).]

 \tilde{C} treated with $(CH_3)_2SO_4+aq$. NaOH gives its methyl ether, 2-chloro-5-methylanisole, b.p. 212.5° (3). [This methyl ether on oxidn. with dil. KMnO₄ (2.7 hrs. for 5 g.) gave (3) 4-chloro-3-methoxybenzoic ac., pr. from 50% alc. or pl. from CHCl₃, m.p. 211° (3), Neut. Eq. 186.5.]

- © 6-Chloro-3-methylphenyl benzoate: from $\bar{C} + BzCl + pyridine$; pr. contg. alc. (3) from alc., m.p. 31° (3), 38° (1); cryst. from lt. pet. ether, m.p. 40° (3).
- ⊕ 6-Chloro-3-methylphenyl benzenesulfonate: from C
 + benzenesulfonyl chloride +
 pyridine; cryst. from alc., m.p. 99° (1).
- © 6-Chloro-3-methylphenyl p-toluenesulfonate: from \bar{C} + p-toluenesulfonyl chloride + pyridine; hexag. pr. from alc. (3) (1) or acetone (3), m.p. 96° (3), 93-94° (1).

3:0700 (1) Houston, Chen, J. Am. Chem. Soc. 55, 4214-4216 (1933).
 42) Kraay, Rec. trav. chim.
 49, 1090 (1930).
 43) Gibson, J. Chem. Soc. 1926, 1424-1425.
 44) Hodgson, Moore, J. Chem. Soc. 1926, 2038-2039.
 45) Raschig, Ger. 232,071, March 4, 1911; Cent. 1911, I 854.

Tbls. from CHCl₃ + lgr. (3) (4); cryst. from pet. eth. (5). — [For crystallog. data see (5) (8).]

[For prepn. (93% yield (9)) from o-chlorobenzoyl chloride (3:6640) + C_6H_6 + AlCl₃ see (3) (5) (9); for formation (12%) in reaction of BzOH + chlorobenzene + AlCl₃ (main prod. 4-chlorobenzophenone (3:1914)) see (2).]

 \bar{C} on reduction with 10% Na/Hg + ale. (11) or boilg. alc. KOH (12) gives almost exclusively 2-chlorodiphenylcarbinol [Beil. VI-680], m.p. 65° (11) (12), 62° (19). — \bar{C} with Al/Hg + 80% alc. (6) gives mainly 2-chlorodiphenylcarbinol (above) + a little 2,2′-dichlorobenzpinacol. — \bar{C} with Zn + AcOH (11) or \bar{C} in alc. on long exposure to sunlight (11) (13) (14) gives 2,2′-dichlorobenzpinacol [Beil. VI₁-(523)], m.p. 174-175° (6), 178° dec. (11).

Č htd. with aniline 3-4 hrs. at 200° yields (4) 2-chlorobenzophenone anil [Beil. XII-201], pale yel. ndls. or scales from alc., m.p. 128° (4). [Fused subst. or solns. in org. solvents (especially CHCl₃) are yellow.]

Č fused for 3 hrs. at 200° with a mixt. of KOH + NaOH gives (1) BzOH (1:0715) (90-95% yield) + chlorobenzene (3:7903) but no o-chlorobenzenic acid; however, Č with aq. NaOH + trace CuO in iron bomb (or in pres. of Fe powder) at 240° for 6 hrs. gives (58% yield (20)) fluorenone (1:9014).

 \bar{C} with CH₃MgI yields (15) 1-(o-chlorophenyl)-1-phenylethylene, oil, b.p. 162-163° at 18 mm. (15); \bar{C} with Mg + MgI₂ easily loses nuclear halogen (16).

② 2-Chlorobenzophenone oxime: from C̄ + NH₂OH.HCl + dil. alc. KOH (5) (17) (7) or from C̄ + NH₂OH.HCl + alc. htd. in s.t. for 3 hrs. at 130° (17); cryst. from pet. ether, m.p. 133-134° (17), 121° (5) (7). [With PCl₅ in dry ether, followed by aq. this oxime yields by Beckmann rearr. o-chlorobenzanilide [Beil. XII-266], m.p. 118° (5), 114° (17).] [The above oxime boiled with conc. aq. KOH for 1 day (5) or refluxed 6 hrs. with 20 pts. 30% MeOH/KOH, then diluted with aq. (17) (18), gives 3-phenylindoxazene [Beil. XXVII-71], ndls. or tbls. from ether or alc., m.p. 83-84° (18), 82.5° (5) (11).]

100

[For prepn. of \bar{C} from 2,2'-dichlorobenzilic acid (1) by oxidn. with CrO₃/AcOH (47% yield (1)) or from di-(o-chlorophenyl)carbinol (1) by oxidn. with Na₂Cr₂O₇/H₂SO₄/AcOH see indic. refs.l

① 2,2'-Dichlorobenzophenone 2,4-dinitrophenylhydrazone: m.p. 206-208° (1).

3:6717 (1) Haller, Bartlett, Drake, Newman, Cristol et al., J. Am. Chem. Soc. 67, 1600-1601 (1945).

3: 0720 ETHYLENE GLYCOL bis-CHLOROACETATE C₆H₈O₄Cl₂ Beil. S.N. 160 ClCH₂.CO.O.CH₂ ClCH₂.CO.O.CH₄

Cryst. from ether/pet. eth. — Insol. aq. (dif. from β -hydroxyethyl chloroacetate (3:6780)).

[For prepn. of $\bar{\mathbf{C}}$ from ethylene oxide (1:6105) with chloroacetic acid (3:1370) as by-product of prepn. of β -hydroxyethyl chloroacetate (3:6780) see (1); note also that $\bar{\mathbf{C}}$ is formed (together with ethylene glycol (1:6465)) by disproportionation of β -hydroxyethyl chloroacetate (3:6780) on long stdg. in ord. glass bottles (1).

C on shaking with aq. is hydrolyzed only very slowly (1).

[For use of \bar{C} as insecticide, fungicide, and disinfectant see (2).]

3:0720 (1) Meerwein, Sönke, *J. prakt. Chem.* (2) **137**, 316-318 (1933). (2) Peet (to Rohm and Haas Co.), U. S. 1,816,441, July 28, 1831; *Cent.* **1932**, I 1146; *C.A.* **25**, 5501 (1931); French 667,633, Oct. 18, 1929; *Cent.* **1930**, I 2614.

3: 0730 CHLOROACETIC ACID ANHYDRIDE
$$C_4H_4O_3Cl_2$$
 Beil. II - 199 $II_{1^-}(89)$ $II_{1^-}(89)$ $II_{1^-}(89)$ $II_{1^-}(89)$ $II_{1^-}(89)$ $II_{1^-}(193)$ $II_{1^-}(193)$

Note that the above name of \tilde{C} is so rendered to emphasize that it is the anhydride of chloroacetic acid (not a monochlorinated acetic anhydride).

Pr. from C₆H₆; eas. sol. cold ether, CHCl₃; spar. sol. cold C₆H₆; insol. cold lgr.

[For prepn. of \bar{C} from chloroacetic acid (3:1370) with P_2O_5 in vac. (2), or with Ac_2O_5 (6) (in latter case note also formn. of mixed anhydride acetic-chloroacetic anhydride, b.p. 80-83° at 30 mm. (5), 80-85° at 20 mm. (3), $D_4^{20} = 1.2003$ (5)), or with chloroacetyl chloride (3:5235) + an inorg. acid chloride (7) or $AlCl_3$ (8), see indic. refs.; for prepn. of \bar{C} from sodium chloroacetate with oxalyl (di)chloride (3:5060) in C_6H_6 (54% yield) see (9); for prepn. of \bar{C} from chloroacetyl chloride (3:5235) with Na_2CO_3 (4) or KNO_3 (1) see indic. refs.]

C with aq. K₂CO₃ yields (2) polyglycolide (1:4970), m.p. 220°.

[For reactn. of \bar{C} with AlCl₃ + toluene giving 46-59% ω -chloro-p-methylacetophenone (3:1130) see (10); for reactn. of \bar{C} with AlCl₃ + biphenyl giving 41% yield ω -chloro-p-phenylacetophenone, pale yel. ndls. from dil. alc., m.p. 122-123° see (11); for abnormal reactn. of \bar{C} with benzyl MgCl yielding ω -chloro- σ -methylacetophenone (3:9660) see (12).]

[For behavior of \bar{C} with various carbohydrates (13) and with cellulose (14) see indic. refs.] \bar{C} htd. 4 hrs. at 160–180° with phenyl isothiocyanate yields (15) after distn. at 14–20 mm. 2,4-dioxo-3-phenylthiazolidine [Beil. XXVII-238, XXVII₁-(305)], m.p. 147–148° (15).]

 \bar{C} with aq. hydrolyzes almost instantly yielding chloroacetic acid (3:1370). — For the amide, anilide, p-toluidide, and other derives corresp. to \bar{C} see chloroacetic acid (3:1370).

$$\alpha, \alpha', \beta, \beta, \beta, \beta', \beta' - \beta' - OCl'ACHLORODIETHYL ETHER C4H2OCl8 Beil. I - 624 (bis-($\alpha, \beta, \beta, \beta$ -tetrachloroethyl) ether) Cl Cl I₁— I₂-(681)$$

M.P. 47° (1) B.P. 130-131° at 11 mm. (1) 45-46° (1) 128-130° at 9 mm. (1) 40-42° (2)

Cryst. with agreeable camphoraceous odor from MeOH or EtOH. — Eas. sol. MeOH, C_6H_6 , toluene, or pet. ether; spar. sol. in abs. alc. below 0°.

C slowly sublimes but on attempted distn. at ord. press. decomposes at about 240°.

[For prepn. of $\bar{\mathbb{C}}$ from chloral (3:5210), chloral hydrate (3:1270), or metachloral with ClSO₃H or FSO₃H at not above 50-60° see {1}; note that from chloral (3:5210) with ClSO₃H at -50° for 10-12 hrs. yield of $\bar{\mathbb{C}}$ may be as high as 50%; from metachloral with ClSO₃H at 50° for a few hrs. yield is 60% {1}; note also that various other products including chloralide (3:3510) are also formed. — For form. of $\bar{\mathbb{C}}$ from trichloroethylene (3:5170) with excess Cl₂O in CCl₄ at -20° {2}, or perhaps from α,α' -dichlorodicthyl ether (3:7595) with Cl₂ in sunlight (3), see indic. refs.]

C on htg. in pres. of air gives (2) phosgene (3:5000).

 \overline{C} on reduction with conc. HI (D=1.78) in boilg. AcOH quantitatively yields (2) ethane.

C is fairly stable toward boilg. aq. or aq. alkalies (1).

Č is claimed (1) to react with 2 moles of RMgX cpds. of either aliphatic or aromatic types, but no details are reported.

3:0738 (1) Fuchs, Katscher, *Ber.* **62**, 2381–2386 (1929). (2) Goldschmidt, Schussler, *Ber.* **58**, 569–570 (1925). (3) Roth, *Ber.* **8**, 1017–1018 (1875).

White cryst. (from pet. ether) (1); hygroscopic scales (from lgr.) (2). — Eas. deliquesces absorbing $\frac{1}{2}$ mole H₂O. — Eas. sol. aq. but insol. almost all org. solvents except cold pet. ether or cold lgr.

[For prepn. from catechol (1,2-dihydroxybenzene) (1:1520) by action of SO₂Cl₂ in ether at 0° see (1) (2); for prepn. from o-benzoquinone [Beil. VII-600] by action of ethereal HCl see (2); 4-chlorocatechol (3:2470) is also a by-product of both methods.]

[\bar{C} on oxidn. with PbO₂ in pet. ether gives (12% yield (2)) 3-chloro-o-benzoquinone [Beil. VII₁-(338)]; for use in prepn. of α -chlorophenazine see (1).]

C with FeCl₃ gives a blue-green color, changing to clear red on addn. of Na₂CO₃ (2).

3-Chloropyrocatechol dibenzoate: ndls. from alc., m.p. 108-109° (2); 109° u.c. (1).
 3:0745 (1) Wrede, Mühlroth, Ber. 63, 1932-1933 (1930). (2) Willstätter, Müller, Ber. 44, 2184-

3:0745 (1) Wrede, Mühlroth, *Ber.* **63**, 1932–1933 (1930). **(2)** Willstätter, Müll**er**, *Ber.* **44**, 2184–2189 (1911).

[See also 1-(chloromethyl)naphthalene (3:0250).]

Colorless cryst. from alc. (6) (5); loses HCl on attempted distn. at ord. press.

[For prepn. of \tilde{C} from 2-methylnaphthalene (1:7605) with Cl_2 in sunlight (5) (3) (6) and best at elevated temp., e.g. 220° (7) or even 250-280° (8) (53% yield (11)), see indic. refs.; from β -naphthylcarbinol [Beil. VI-668] (4) (2) with PCl_3 (2) or with $SOCl_2$ in toluene (4) see indic. refs.; from N-(benzoyl)- β -naphthylmethylamine (1) or from N-(benzoyl)- β -naphthylmethyl)amine (1) by htg. with PCl_3 see (1).]

 \bar{C} on oxidn. with aq. Pb(NO₃)₂ soln. yields (6) β -naphthaldehyde (1:0036); \bar{C} on oxidn. with alk. KMnO₄ yields (6) β -naphthoic acid (1:0800).

C on reductn. with Zn/Cu couple yields (2) 2-methylnaphthalene (1:7605).

[\bar{C} with excess Na in dry ether readily gives (8) α,β -bis-(2-naphthylmethyl)ethane, m.p. 182° (9) (picrate, m.p. 198° (9)).] — [For study of reactn. of \bar{C} with 1-(chloromethyl)-naphthalene (3:0250) + AlCl₃ in CS₂ see (7).]

[C with Mg in dry ether + trace C_2H_5I gives corresp. β - $C_{10}H_7$. CH_2MgCl , but reactn. is capricious and requires pure C (4); the RMgCl cpd. with AcCl in ether does not follow a normal course but gives instead 1,3-di-(β -naphthyl)-2-methylpropene-1, cryst. from AcOH, m.p. 184-185° (4).]

[For study of reactn. of \tilde{C} with ethyl acetoacetate + NaOEt in abs. alc. giving (83% yield) ethyl α -(β -naphthylmethyl)acetoacetate see (10).]

 \overline{C} with aq. at 100° for $1\frac{1}{2}$ hrs. is 17% hydrolyzed (1).

[\bar{C} with large excess of conc. C_6H_6 soln. of dimethylamine htd. in s.t. at 100° for 10 hrs. yields (1) N,N-dimethyl- β -naphthylmethyl-amine.]

3:0747 (1) von Braun, Moldaenke, Ber. 56, 2168-2171 (1923). (2) Sah, Rec. trav. chim. 59, 461-470 (1940); C.A. 35, 4763 (1941). [See also liquid diastereoisomer (3:9068).]

Colorless crystals from alc. (2).

[For prepn. of \tilde{C} (30-50% yield of mixed solid + liquid stereomers (2)) from 1,2-dichloroethylene (3:5030) + 1,1,2-trichloroethane (3:5330) + 1% AlCl₃ for 5 days at 35-40° see (2); for formn. of \tilde{C} from 1,2-dichloroethylene (3:5030) with HCl + AlCl₃ at 50° see (1).]

Č in CCl₄ treated with AlCl₃ remains colorless and the solution does not (2) evolve HCl, even on boilg.

Č in alc. treated with Zn dust gives (80% yield (2)) 1-chlorobutadiene-1,3 (3:7210), b.p. 68° (2).

 \bar{C} dissolved in hot alc. and titrated with N/10 KOH splits off 1.44-1.59 moles HCl (2).

[A pentachlorobutane obtained (3) from trichloroethylene (3:5170) + 1,1-dichloroethane (3:5035) + AlCl₃ may or may not be identical with \tilde{C} .]

3:0765 p-CHLOROBENZALDEHYDE CLCCHO C7H5OCl Beil. VII - 235 VIII-(133)

M.P.	49°	(1)	R.P.	214.5-216.5°	at	760 mm.	(3)	
	48°	(2) (3)		213-214°			(6)	(8)
	47.5°	(4) (6)		213°	at	748 mm.	(9)	
	47°	(5)		108-111°	at	25 mm.	(7)	
	46-47°	(7)						

Colorless pl. with odor like benzaldehyde. — Volatile with steam. — Somewhat sol. cold aq., more sol. hot aq.; eas. sol. alc., ether, C_6H_6 , CS_2 , AcOH. — Forms spar. sol. NaHSO₃ cpd.

[For prepn. of \bar{C} from p-chlorotoluene (3:8287) with CrO_2Cl_2 (10), or by halogenation to p-chlorobenzal (di)chloride (3:6700) (7) (46) or p-chlorobenzal (di)bromide (11) and their subsequent hydrolysis with fumg. H_2SO_4 (6) (12) (13), conc. H_2SO_4 (7), anhydrous oxalic acid (8), or water in a s.t. at 170° (14) (15) see indicated refs.; from p-aminobenzaldehyde by diazotization and reactn. with CuCl (73% yield (16)) see (16) (17) (1); from p-chlorobenzyl chloride (3:0220) (or bromide) by boilg. with aq. $Pb(NO_3)_2$ in CO_2 (4) (5) or with hexamethylenetetramine (2); from p-chlorobromobenzene vap-chlorophenyl MgBr and its reactn. with ethyl orthoformate (64% yield) (18); from p-chlorobenzonitrile with $SnCl_2$ (19); from chlorobenzene + HCN + $AlCl_3$ (20) or with CO + $AlCl_3$ (21); from p-chlorobenzylamine with hexamethylenetetramine (45) see indic. refs.]

 $\bar{\mathbb{C}}$ with KMnO₄ (2) (4) (5) or even slowly in air oxidizes to p-chlorobenzoic ac. (3:4940), m.p. 236°. [For study of auto-oxidation see (22).] — $\bar{\mathbb{C}}$ on cat. hydrogenation (92% yield (23)) or electrolytic reductn. (24) or by actn. of iodo-magnesium hydrobenzoinate (84% yield (25)) gives p-chlorobenzyl alc., ndls. from $C_6H_6/lgr.$, m.p. 71–72.5° (23). — $\bar{\mathbb{C}}$ with conc. alk. undergoes Cannizzaro reactn. (for study see (26) (28)) although presumable products, p-chlorobenzyl alc. and p-chlorobenzoic ac., have not been (by this reactn.) actually isolated. [For study of $\bar{\mathbb{C}}$ in mixed Cannizzaro reactn. see (27).]

 \bar{C} on reduction with Ni/Al alloy (Raney Ni) in aq. alk. gives (60% yield (48)) toluene (1:7405).

Č with dil. KCN gives benzoin condensation yielding 4,4'-dichlorobenzoin, m.p. 85-87° (29), which on oxidn. with HNO₃ in AcOH yields 4,4'-dichlorodibenzil, m.p. 195-196° (29).

C on htg. with NaOAc + Ac₂O for 8 hrs. at 180-200° undergoes Perkin reactn. giving (yield: 52% (13), 60% (17)) p-chlorocinnamic ac., m.p. 249-250° (17), 247° (13) (31). [This with Br₂ in CHCl₃ gives (30) p-chlorocinnamic acid dibromide, m.p. 191° (30).]—C + malonic acid + pyridine gives alm. quant. yield (31) p-chlorocinnamic acid. [With-

out pyridine reactn. gives (100% yield (31)) p-chlorobenzalmalonic acid, m.p. 197-198° dec. (31).]

 \bar{C} on mononitration with conc. HNO₃ + conc. H₂SO₄ at 80-90° gives (32) (33) 4-chloro-3-nitrobenzaldehyde [Beil. VII-262], ndls. from CHCl₃/lgr. or from aq., m.p. 62° (32) (33); ndls. from dil. alc., m.p. 64.5° (34) [oxime, pale yel. ndls. from alc., m.p. 146° (34), 141.5-142.5° (35); phenylhydrazone, m.p. 148.5-149.5° (35), p-nitrophenylhydrazone, or. ndls., m.p. 278-279° (34); semicarbazone, yel. ndls., m.p. 244-245° dec. (35)].

Č htd. at 100° with 1 mole aniline gives (16) (36) p-chlorobenzalaniline, pale yel. pl., from alc., m.p. 62° (16) (36); Č htd. with 1 mole p-toluidine gives (16) (36) p-chlorobenzal-p-toluidine, colorless ndls. from alc., m.p. 125° (16) (36).

[For conversion of \tilde{C} with MeMgX to p-chlorophenyl-methyl-carbinol and dehydration of latter to p-chlorostyrene see (46).]

- p-Chlorobenzaldoxime (anti form): cryst. from alc., m.p. 106-107° (6) (37). [From C + NH₂OH.HCl + Na₂CO₃ (6); the syn isomer has m.p. 142° (37), 140° (6), and on fusion is converted to anti isomer (6).]
- **p-Chlorobenzaldehyde phenylhydrazone:** lt. yel. cryst. from dil. alc., m.p. 127-127.5° (35), 126-128° (38). [For study of kinetics of formn. see (39).]
- p-Chlorobenzaldehyde p-nitrophenylhydrazone: dk. br. cryst. from alc., m.p. 216.5° u.c. (40), 224° (41), 218-220° (35).
- p-Chlorobenzaldehyde 2,4-dinitrophenylhydrazone: or. cryst., m.p. 270° (42), 265° (45), 264° cor. (43). [Use in detn. of C (43).]
- p-Chlorobenzaldehyde semicarbazone: tbls. from pyridine (10), ndls. from MeOH (44, m.p. 230° (10) (47), 232-233° (44).

$$C_{10}H_{20}Cl_2$$
 Beil. I — Cl Cl I_{1-} (66) I_{2-} CH_3 — C — CH_2 . CH_2 . CH_2 . CH_3 — C — CH_3 CH_3

Cryst. (from abs. alc.) with agreeable musk-like odor.

[For prepn. of C from 2,7-dimethyloctanediol-2,7 [Beil. I₁-(257)] with conc. HCl in the cold or with HCl gas in toluene see (1).]

3:0840 (1) Bouvet, Bull. soc. chim. (4) 17, 204 (1915).

Colorless ndls.

[For prepn. of Č from anhydrous chloral (3:5210) with 1 mole n-butyl alcohol (1:6180) (1) (2), or from chloral hydrate (3:1270) under reflux with n-BuOH (yields: 54% in 45 min., 28% in 60 min. (3)) or with tri-n-butyl orthoformate, see indic. refs.; for study of formn. of Č from chloral ethylalcoholate (3:0860) or from chloral n-propyl-hemiacetal by reflux with n-BuOH for 45 min. (yield 40-50%) see (3).]

[\bar{C} with AcCl gives (78% yield (1)) corresp. acetate, b.p. 129–131° at 20 mm. (1).] [For behavior of \bar{C} with diazomethane see (4).]

3:0843 (1) Fourneau, Florence, Bull. soc. chim. (4) 47, 352 (1930). (2) Kuntze, Arch. Pharm. 246, 98 (1908). (3) Post, J. Org. Chem. 6, 832-833 (1941). (4) Meerwein, Bersin, Burneleit, Ber. 62, 1009 (1929).

M.P. 49-50° (1)

[For form. of \bar{C} from 3,5-dimethylphenol (sym.-m-xylenol) (1:1455) with SO_2Cl_2 in CHCl₃ (as by-product of the principal isomer 4-chloro-3,5-dimethylphenol (3:3505)) see (1).]

- --- 2-Chloro-3,5-dimethylphenyl acetate: unreported.
- ---- 2-Chloro-3,5-dimethylphenyl benzoate: unreported.
- 3:0844 (1) Lesser, Gad, Ber. 56, 974 (1923).

3: 0846 1,1,1-TRICHLOROPROPANOL-2
$$C_3H_5OCl_3$$
 Beil. I - 365 $(\beta,\beta,\beta$ -Trichloroisopropyl CH_3 — CH — CCl_3 I_1 -(185) alcohol; "Isopral") OH 12-(385)

Hexag. cryst. from aq. (7); for crystallographic data see (2). — Spar. sol. aq., eas. sol. org. solvents (for data see (7)). — \bar{C} has high vapor press. (for measurement see (2)) and sublimes even at ord. temp. (for study of sublimation of \bar{C} by various methods see (5)).

[For prepn. of $\tilde{\mathbb{C}}$ from 1,1,1-trichloropropanone-2 (3:5620) by reduction with fused Al(OEt)₃ in abs. alc. under H₂ or N₂ (8) or with AlEt₃ etherate in ether (3) (yields: 67% (8), 65% (3)) see indic. refs.; for prepn. of $\tilde{\mathbb{C}}$ from chloral (3:5210) with CH₃MgBr (9) (19) (2) cf. (4) or MeMgI (2) cf. (4) (yield: 40% (9) (2)) see indic. refs. (note that by this method the normal addn. of RMgX leading to $\tilde{\mathbb{C}}$ is accompanied by reduction leading to 2,2,2-trichloroethanol (3:5775) and the relative proportion of these two reactions is profoundly influenced by the pres. of metal salts (9)); for prepn. of $\tilde{\mathbb{C}}$ from chloral (3:5210) with ZnMe₂ see (6).]

Č is used as hypnotic pharmaceutical under the trade name "Isopral" (10), for use as seed disinfectant see (11); for study of disinfectant power and toxicity see (12); for comparative study of narcotic action see (13). — For study of tests for C see (7) (14).

 \bar{C} on reduction in aq. AcOH + Zn dust in cold yields (15) 1,1-dichloropropene-1 (3:5120). \bar{C} on oxidn. with fumg. HNO₃ under reflux for 5 hrs. gives (2) trichloroacetic acid (3:1150); use of $K_2CR_2O_7$ + H_2SO_4 gives only insignificant yields (2) while less strong HNO₃ even after 4 hrs. at 100° has only slight action (2).

 \bar{C} with P_2O_5 on htg. loses H_2O giving (84% yield (19)) (2) 1,1,1-trichloropropene-2 (3:5345), b.p. 114-115° at 757 mm. (2).

[\bar{C} with HNO₃/H₂SO₄ mixt. yields (2) β,β,β -trichloroisopropyl nitrate, oil, $D_{-}^{13} = 1.499$, $n_{\bar{D}} = 1.47892$, but decompg. on htg. — \bar{C} with PCl₃ or PCl₅ yields (2) (1) various partial ester/acid chloride derivs. of phosphorous or phosphoric acids. — \bar{C} with SOCl₂ evolves HCl + SO₂ and also yields (2) a liq. presumably β,β,β -trichloroisopropyl chlorosulfonate.]

 \tilde{C} with aq. or alc. NaOH or conc. aq. Na₂CO₃ gives on htg. (16) (17) mainly acetaldehyde (1:0100) and lactic acid (1:0400), also accompanied by formic acid (1:1005) and carbon monoxide; for use of this reactn. in detection of \tilde{C} see (14). — \tilde{C} with EtOH/NaOEt on htg. gives (15) ethyl α -ethoxypropionate [Beil. III-280, III₁-(109), III₂-(206)], b.p. 155° cor. at 760 mm., $D_4^{20} = 0.9446$, $n_D^{20} = 1.40125$.

[Č with AcCl yields (2) β,β,β -trichloroisopropyl acetate, b.p. 180–181° cor. 766 mm., m.p. + 8°, $D_{13}^{13} = 1.353$, $n_{\overline{D}} = 1.46017$ (2).]

— $\beta_{\gamma}\beta_{\gamma}\beta_{\gamma}$ -Trichloroisopropyl carbamate: cryst. from C_6H_6 , m.p. 125° (18). Prepd. indirectly from $\beta_{\gamma}\beta_{\gamma}\beta_{\gamma}$ -trichloroisopropoxy MgBr with phosgene in toluene, followed by treatment with NH₃ (35% yield (18)).]

	7.5° 6.6°	(4) (5)		115-116° 111.0	at 741.4 mm.	(9) . (4)	
4. 4.	6° 5.2° (5°–46.5° 0°	(6) (7) (10) (8) (9)					

[See also chloral (3:5210) and chloral hydrate (3:1270).]

PREPARATION

From chloral. [For prepn. of \bar{C} from chloral (3:5210) with EtOH (1:6130) (yields: 100% (11), 71.3% with 95% EtOH refluxed 2 hrs. (4) (9) (12)) see indic. refs.; for influence of solvents see (13) (14); for form. of \bar{C} from chloral (3:5210) + AcH + Al(OEt)₃ see (8).]

From chloral hydrate. [For prepn. of \bar{C} from chloral hydrate (3:1270) with EtOH (1:6130) (yield: 75% in 60 min., 38% in 24 hrs. reflux (4)), with triethyl orthoformate (1:3241) (25% yield in 105 min. reflux (4)), or with tetraethyl orthosilicate (4% yield in 4 hrs. reflux (4)) see indic. refs.]

From ethyl alcohol. [For formn. of \ddot{C} as end prod. of reaction of ethyl alcohol (1:6130) with Cl_2 see (15).]

PHYSICAL PROFERTIES

 \tilde{C} is less sol. in aq. than chloral hydrate (3:1270) (6) (7). — [For study of toxicity of \tilde{C} as compared with chloral hydrate (3:1270) see (29).]

CHEMICAL BEHAVIOR

Dissociation. \tilde{C} on distillation (7) or in some solns, in org. solvents cf. (17) (2) (18) is partially dissociated into chloral (3:5210) and EtOH (1:6130).

BEHAVIOR WITH INORGANIC REACTANTS

With H_2SO_4 . \bar{C} with cold cone. H_2SO_4 yields (1) chloral (3:5210) (or its polymerization products) and EtHSO₄.

With aq. alkali. \bar{C} with aq. alkali gives (6) CHCl₃ (3:5050) + salts of formic acid (1:1005).

With chlorine. [\bar{C} with Cl₂ at 80° gives (19) trichloroacetaldehyde diethylacetal (3:6317).] With PCl₅. [\bar{C} with PCl₅ in ether below 20° (20) (4) cf. (21) (22) gives (yields: 55-74% (20), 25-33% (11)) α,β,β,β -tetrachloroethyl ethyl ether [Beil. I-623, I₂-(681)], b.p. 189.7° at 758.7 mm. (21), 189.4° at 749.1 mm. cor. (20), 184° at 738 mm. (4), 79° at 16 mm. (20); $D_4^{18} = 1.4225$ (20).]

BEHAVIOR WITH ORGANIC REACTANTS

With other alcohols. [Č with other alcohols may undergo an exchange of alkyl radicals; for studies of such interchange see (4) (2).]

With aic. NaOEt. [C with EtOH/NaOEt yields (23) CHCl₃ (3:5050) + ethyl formate (1:3000).]

With alc. KCN. [C with EtOH/KCN gives within 1 min. (88% yield (24)) ethyl dichloroacetate (3:5850): cf. behavior of chloral (3:5210) with KCN in various alcohols.]

With acid chlorides. [C with AcCl (3:7065) gives (25) the corresp. acetate [Beil. I-153], b.p. 198°. — C with isovaleryl chloride (3:7560) gives (41% yield (26)) the corresp. isovalerate, b.p. 143° at 20 mm. (26).]

With diazomethane. [\bar{C} with CH₂N₂ in EtOH soln. at 0° gives (27) trichloroacetaldehyde ethyl-methyl-acetal [Beil. I-621, I₂-(681)], b.p. 193.4° cor. (28), 78-80° at 13 mm. (27) accompanied by 3,3,3-trichloro-1,2-epoxypropane (3:5760).]

- **Behavior on heating.** Note that \bar{C} on htg. gives off inflammable vapor (EtOH) (dif. from chloral hydrate (3:1270) whose initial ignition cannot be maintained).
- P Behavior with conc. HNO₃. C reacts violently on warming with conc. HNO₃ (dif.) from chloral hydrate (3:1270) which is almost unaffected).
- P Iodoform test. C with aq. alk. + I₂/KI soln. on warming gives iodoform, m.p. 119° accompanied of course by CHCl₃ (3:5050) (dif. from chloral hydrate (3:1270)).

3:0870 1,2,3,4-TETRACHLOROBUTADIENE-1,3 C₄H₂Cl₄ Beil. S.N. 12 (Solid stereoisomer) HC=C-C=CH

M.P. 50° (1)

[See also the liquid stereoisomer (3:6150).]

[For isolation of \bar{C} from the high-boilg, fractn. resulting in the preparation of trichloroethylene (3:5170) from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) see (1).]

Č adds Cl₂ (although much more slowly than its liquid stereoisomer) yielding 1,1,2,3,4,4-hexachlorobutene-2 (3:1945), m.p. 80° (1). [This product with Zn/Cu couple in hot alc. regenerates C̄, but in alc. with Ca(OH)₂ or with alk. at room temp. gives the liquid stereoisomer (3:9046) (1).]

Č in CHCl₃ treated with Br₂ gives (100% yield (1)) 1,2-dibromo-1,2,3,4-tetrachloro-butene-2, m.p. 105° (1). [This prod. with Zn/Cu couple in hot alc. regenerates Č (1).]

3:0870 (1) Müller, Hüther, Ber. 64, 589-600 (1931); C.A. 25, 3956 (1931).

α-CHLORO-DIPHENYLACETYL CHLORIDE C14H10OCl2 3:0885 Beil. IX - 675 (Diphenyl-chloro-acetyl chloride) IX₁-(283)

Cryst. from lgr.

[For prepn. of \bar{C} from benzilic acid (α -hydroxy-diphenyl-acetic acid) (1:0770) with 2 moles PCl₅ at 120-130° (2), at 100° (8) (68% yield (9)), or with excess PCl₅ in C₆H₆ at room temp. (7) see indic. refs. (Note that benzilic acid dislvd. in undil. SOCl2 yields (4) benzophenone (1:5150), that benzilic acid treated with 3 moles SOCl₂ in CCl₄ for several days at room temp. ppts. (5) diphenylchloroacetic acid (3:3585), m.p. 118-119° dec., and that benzilic acid in CCl4 with 6 moles SOCl2 refluxed for several days yields (5) on concn. of the soln. diphenyl-chloro-acetic anhydride [Beil. IX₁-(228)], m.p. 129° (5).) - For formn, of C from diphenylketene [Beil. VII-471, VII₁-(254)] with SOCl₂ or SO₂Cl₂ by htg. at 100° in s.t. in absence of air (1), or from diphenyldiazomethane [Beil. VII-418, VII₁-(226)] with liq. phosgene in pet. ether in s.t. (92% yield), see (6).]

[For abnormal reactn. of \bar{C} with C_6H_5MgBr see (9) (10); for reactn. of \bar{C} with Zn filings in dry ether yielding diphenylketene (above) see (11); for reactn. of C with phenylhydroxylamine in ether giving quant, yield of anhydro-[N-phenyl-benzilhydroxamic acid] [Beil. XXVII₁-(290), cryst. from MeOH, m.p. 72-73°, see (12).]

 \bar{C} in ether treated with gaseous NH₃ (2) (13) yields α -chloro-diphenylacetamide, m.p. 115° (2), 111-113° (13). [This product on boilg, with aq. yields (2) benzilamide, m.p. 154° (2).]

C dislyd. in dry ether and treated with 2 moles aniline in dry ether ppts. aniline hydrochloride and from the filtrate addn. of pet. ether ppts. (3) a-chloro-diphenyl-acet-anilide, m.p. 88° (3); this prod. on htg. with more aniline or C warmed with 4 moles aniline yields (3) a-anilido-diphenyl-acet-anilide, ndls. from alc., m.p. 181-182° (3). [Both the first prod. (on treatment with Na₂CO₃) and the latter prod. (on HCl hydrolysis) yield (3) benzilic acid anilide, m.p. 175° (3).]

3: 0900 β-NAPHTHOYL CHLORIDE

B.P. 304-306° (2) M.P. 51° (1) 43° (2)

Cryst. pdr. from C₆H₆ + lt. pet. (1). - Sol. ether, CHCl₃, C₆H₆; insol. aq.

[For prepn. of \tilde{C} from β -naphthoic acid (1:0800) with PCl₅ (2) (3) or with SOCl₂ (100% yield (4)) (1) (5) see indic. refs.]

 \bar{C} with ter bases + $K_2S_2O_5$ (6) or \bar{C} with calcium β -naphthoate at 150-160° (7) yields β -naphthoic acid anhydride, m.p. 134° (7) [cf. α -naphthoyl chloride (3:6930)].

[\bar{C} with AlCl₃ and hydrocarbons yields corresp. β -naphthyl ketones: e.g., with biphenyl (8), with β -methylnaphthalene (9), with 2,3- (10), 2,6- (11), and 2,7- (12) dimethylnaphthalenes, or with anisole (13) see indic. refs.; \bar{C} with RMgX cpds. also yields β -naphthyl ketones; e.g., see (14).]

[For use of C in prepn. of vat dyes from mono- and diamino-anthraquinones see (15).]

 \tilde{C} with hydrazine hydrate yields (5) both β -naphthoylhydrazine (β -naphthoylhydrazide), cryst. from alc., m.p. 147.5° (5), and N,N'-bis-(β -naphthoyl)hydrazine, cryst. from AcOH, m.p. 241° (5).

 $\bar{\mathbf{C}}$ on hydrolysis yields β -naphthoic acid (1:0800), m.p. 184°. — For the amide, anilide, p-toluidide, and other derivs. corresp. to $\bar{\mathbf{C}}$ see β -naphthoic acid (1:0800); in addition see below.

⑤ β -Naphthoic β -naphthalide: ndls. from hot CHCl₃, m.p. 238° (4). [From $\tilde{C} + \beta$ -naphthylamine in C_6H_6 (4).]

$$\begin{array}{cccc} & \text{Cl} & \text{C}_6\text{H}_2\text{Cl}_4 & \text{Beil. V - 204} \\ & & \text{V}_1\text{-(113)} \\ & & \text{V}_2\text{-(157)} \end{array}$$

Ndls. from alc. — Spar. sol. cold alc.; eas. sol. C_6H_6 , very eas. sol. CS_2 or lgr. — Volatile with steam.

[For prepn. of \bar{C} from 2,4,6-trichloroaniline [Beil. XII-627, XII₁-(312)] via diazotization and use of Cu₂Cl₂ reactn. (2) (6) (9) or otherwise (5) (yield: 64% (6), 61% (9), 55.8% (2)) see indic. refs.; from 2,3,4,6-tetrachloroaniline [Beil. XII-630, XII₁-(313)] by replacement of $-NH_2$ by -H (3); from 2,6-dichloro-p-phenylenediamine [Beil. XIII-118, XIII₁-(37)] via tetrazotization and warming with Cu₂Cl₂ see (7); for formn. of \bar{C} from p-dichlorobenzene (3:0980) with AlCl₃ + S₂Cl₂ in SO₂Cl₂ at 40° (10% pure \bar{C} + 67% 1,2,4,5-tetrachlorobenzene (3:4115)) see (1); from 2,4,6-trichlorophenol (3:1673) with PCl₃ + PCl₅ in s.t. at 200–300° see Beil. V-204; from 3,5-dibromo-4-chlorobenzenesulfonyl chloride (10) or 2,5-dichlorobenzene-1,3-bis-(sulfonyl chloride) (8) or chlorobenzene-2,4,6-tris-(sulfonyl chloride) (4) on htg. in s.t. with PCl₅ see indic. refs.; for formn. of \bar{C} from 1,3,5-trichloro-

benzene (3:1400) with Cl₂ in pres. of Al/Hg see (11); from benzene (12), chlorobenzene (13), or diphenyl sulfone (14) with Cl₂ followed by treatment with alc. KOH see indic. refs.] [For behavior of \tilde{C} with liq. Cl₂ yielding addn. products see (15).]

[For behavior of C with NaOMe see (2) (16).]

 \bar{C} on mononitration, e.g., by boilg, for $\frac{1}{2}$ hr. with 3 pts. HNO₃ (D=1.52) as directed (17), gives 96.7% yield (17) 1,2,3,5-tetrachloro-4-nitrobenzene, cryst. from spontaneous evapn. of alc. soln., m.p. 40-41° (17) (the m p. of 21-22° previously reported (5) was on impure material).

 \bar{C} on dinitration, e.g., by boilg. with a mixt. of 10 pts. fumg. HNO₃ (D=1.52) + 4 pts. conc. H₂SO₄ for 1 hr. and then pouring into aq. (17), gives (100% yield (17)) (9) 1,2,3,5-tetrachloro-4,6-dinitrobenzene [Beil. V-266], pl. from 90% AcOH, m.p. 162° (9), 161-162° (17). (This prod. on htg. with aniline yields (9) (18) 2-chloro-1,3,5-trianilino-4,6-dinitrobenzene, crimson pl., m.p. 179° (9), 179-180° (18).)

$$\alpha,\beta,\beta$$
-TRICHLORO- n -BUTYRIC ACID Cl C₄H₅O₂Cl₃ Beil. II -281 CH₃-C-CH-COOH II₁- II₂- Cl Cl Cl

M.P. 51.5-52° (1)

Tbls. from lgr. — Spar. sol. aq., eas. sol. alc., ether, C₆H₆, CHCl₃, CS₂.

[For prepn. of \bar{C} from either β -chlorocrotonic acid (3:2625) or β -chloroisocrotonic acid (3:1300) in CS_2 soln. with CI_2 stood several days in the dark see (1).]

[\bar{C} in aq. with granulated Zn stood for 6 weeks, then acidified, yields (1) mainly β -chloro-isocrotonic acid (3:1300) accompanied by some β -chlorocrotonic acid (3:2625); note that former is separated from latter by its greater volatility with steam.]

C with aq. Na₂CO₃ soln. on boilg. loses both HCl and CO₂ yielding the higher-boilg. (1) 1,2-dichloropropene-1 (3:5150).

 \bar{C} with alc. KOH (2 moles) loses HCl yielding (1) mainly α,β -dichloroisocrotonic acid [Beil. II-418], m.p. 75.5°, accompanied by a little α,β -dichlorocrotonic acid [Beil. II-418], m.p. 92°; note that these are separated by the greater soly. of the former in lgr. (1).

The acid chloride corresp. to C is unreported.

- Methyl α,β,β -trichloro-n-butyrate: unreported.
- Ethyl α, β, β -trichloro-n-butyrate: unreported.
- ---- α,β,β-Trichloro-n-butyramide: unreported.
- α,β,β-Trichloro-n-butyranilide: unreported.
 α,β,β-Trichloro-n-butyr-α-naphthalide: unreported.

3:0925 (1) Szenic, Taggesell, Ber. 28, 2665-2672 (1895).

M.P. 52° (1)

Cryst. from lt. pet. — Volatile with steam.

[For prepn. of \bar{C} from 6-chloro-2-amino-3,4-dimethylphenol (5-chloro-3-amino-0-4-xylenol) (1) via diazotization and reaction with Cu_2Cl_2 (yield not stated) see (1); from 2,6-dichloro-3,4-dimethylaniline (3,5-dichloro-0-4-xylidine) (2) via diazotization and hydrolysis (yield not stated) see (1).]

The nitration of \bar{C} has not been reported, and the expected 5-nitro-2,6-dichloro-3,4-dimethylphenol is unknown.

2,6-Dichloro-3,4-dimethylphenyl acetate: unreported.

D 2.6-Dichloro-3,4-dimethylphenyl benzoate: m.p. 89° (1).

3:6935 (1) Hinkel, Ayling, Bevan, J. Chem. Soc. 1928, 2532. (2) Hinkel, Ayling, Bevan, J. Chem. Soc. 1928, 1878.

M.P. 52-53° (1) B.P. 80-81° at 40 mm. (1)

Soft waxy solid with characteristic alkyl halide odor; on long stdg. the opaque crystn. structure disappears and \bar{C} becomes transparent (1).

[For prepn. of \bar{C} from 2,2,3,3-tetramethylbutane (hexamethylethane) (1:7090) with Cl_2 in CCl_4 soln. in sunlight (33% yield together with other products) see (1).]

 \bar{C} with Mg + trace of I₂ + a little C₂H₅Br in dry ether gives in 19 hrs. 70% yield corresp. RMgCl (accompanied by 24% 2,2,3,3,6,6,7,7-octamethyloctane, pl. from MeOH, m.p. 74.0-74.5°, from coupling of \bar{C}) (1).

C converted (as above) to RMgCl, treated with wet ether, and poured into dil. H₂SO₄ gives (1) hexamethylethane (1:7090), m.p. 101-102° (1).

 \ddot{C} converted to RMgCl (as above) and the ether soln. treated at -5° with CO₂ gives (59% yield (1)) 3,3,4,4-tetramethylpentanoic acid, cryst. from dil. MeOH, m.p. 66–67° (1). [This acid with SOCl₂ in C₆H₅ gives (80% yield (1)) the corresp. acid chloride, b.p. 87–88° at 20 mm., $D_{-}^{20} = 0.9821$, $n_{D}^{20} = 1.4557$; the latter with dry NH₃ in ether gives (77% yield (1)) the corresp. amide, cryst. from CHCl₃, m.p. 137–138° (a second cryst. form from MeOH has m.p. 149–150° but after fusion melts 137–138°), or with aniline in ether gives the corresp. anilide, cryst. from pet. eth., m.p. 175–176° (1).]

C converted to RMgCl (as above) and the ether soln. treated at -5° with dry O₂ for 4 hrs. gives (53% yield (1)) 2,2,3,3-tetramethylbutanol-1, very volatile solid, m.p. 149-150° [corresp. 3,5-dinitrobenzoate, m.p. 88-90°; N-phenylcarbamate, m.p. 65-66° (1)].

Č converted to RMgCl (as above) and treated with ethereal HgCl₂ gives (35% yield (1)) 2,2,3,3-tetramethylbutyl mercuric chloride, feathery white cryst., m.p. 170-171° (1).

3:0945 (1) Whitmore, Marker, Plambeck, J. Am. Chem. Soc. 63, 1626-1630 (1941).

3:0960 4-CHLORO-2-HYDROXYBENZALDEHYDE C₇H₅O₂Cl Beil. No. 744 (4-Chlorosalicylaldehyde) Cl CHO

M.P. 52.5° (1)

Long colorless ndls. from alc. or dil. AcOH (1). — \tilde{C} has odor of walnuts (1). — \tilde{C} is apprec. sol. in aq. or aq. H_2SO_3 ; readily sol. in org. solvents. — \tilde{C} is very volatile with steam even from its yel. soln. in alk. (1).

[For prepn. of $\tilde{\mathbf{C}}$ from *m*-chlorophenol (3:0255) via Reimer-Tiemann procedure see (1).]

Č does not reduce NH₄OH/AgNO₃ o Fehling soln.; is very resistant to oxidn. by acid, alk., or neutral KMnO₄, and to acetylation (but not benzoylation, q.v. below) (1).

 \bar{C} with FeCl₃ gives brown ppt.; with CuSO₄ or $Cr_2(SO_4)_3$ + dil. aq. alk. gives bright green copper salt and a dark green chromium salt (1).

Č on mononitration as specified (2) yields 5-nitro-4-chloro-2-hydroxybenzaldehyde, pale yel. ndls. from alc., m.p. 116° (2). [This product yields a phenylhydrazone, or.-yel. ndls., m.p. 188° dec.; a p-nitrophenylhydrazone, brn.-yel. ndls. from alc. or AcOH, m.p. 294° dec.; and a semicarbazone, pale yel. ndls. from dil. AcOH, dec. above 300° (2).]

Č on dinitration as specified (2) yields 3,5-dinitro-4-chloro-2-hydroxybenzaldehyde, pale gold.-yel. ndls. from aq., m.p. 153° (2). [This product yields a phenylhydrazone, light brn. cryst. from alc., m.p. 219°; a p-nitrophenylhydrazone, light brn. cryst. from dil. AcOH, m.p. 286° dec.; and a semicarbazone, light yel. cryst. from dil. AcOH, m.p. 225° dec. (2).]

- (1). 4-Chloro-2-hydroxybenzaldoxime: colorless ndls. from alc., m.p. 155° (1).
- 4-Chloro-2-hydroxybenzaldehyde p-nitrophenylhydrazone: or. ndls. from AcOH, m.p. 257° (1).
- 4-Chloro-2-hydroxybenzaldehyde semicarbazone: pale yel. cryst. from AcOH, m.p. 212° (1).
- 4-Chloro-2-benzoxybenzaldehyde: from C + BzCl in ether + pyridine; ndls. from alc., m.p. 98.5° (1).

 $\bar{\mathbf{C}}$ is widely used as anti-moth agent and vapor fumigant but lit. and patents are so numerous that they cannot be included here; note, however, prevention of caking of $\bar{\mathbf{C}}$ by mixt. with 1-10% paraformaldehyde (43). — [For study of toxicity of $\bar{\mathbf{C}}$ see (44). — For use of $\bar{\mathbf{C}}$ in prepn. of sulfur dyes see (45).]

[For detn. of \bar{C} in air see (46); for detn. of \bar{C} in soil by means of detn. of refractive index of solns. in kerosene see (47).]

[For prepn. of \bar{C} from p-chloroaniline [Beil. XII-607, XII₁-(304)] via diazotization, prepn. of diazonium/ZnCl₂ double salt, and decompn. of latter in molten phenol (41% yield \bar{C} together with 31% hydroxybiphenyl + 15% diphenyl ether) see (48); from p-phenylenediamine [Beil. XIII-61, XIII₁-(18)] via tetrazotization in AcOH (49) or H₃PO₄ (50) with nitrosylsulfuric acid followed by subsequent reactn. with Cu₂Cl₂ (yield: 70% (49) (50)) cf. (51), or by reduction with SnCl₂/HCl to p-phenylenedihydrazine and oxidn. with CuSO₄ (52), see indic. rcfs.]

[For prepn. of $\bar{\mathbb{C}}$ from p-chloro-nitrobenzene [Beil. V-243, V₁-(130)] with conc. HCl in s.t. at 270° (53), or with SOCl₂ in s.t. at 160–200° (54) (55), see indic. refs.; from p-bromonitrobenzene [Beil. V-248, V₁-(132)] (56), phenol-p-sulfonic acid [Beil. XI-241, XI₁-(55)] (57), or p-chlorophenol (3:0475) (16) with PCl₅ on htg. see indic. refs.; from p-chlorophenzenesulfonic acid [Beil. XI-54, XI₁-(14)] with SOCl₂ in s.t. at 160–200° see (54) (55); from 2,5-dichlorobenzophenone (3:2340) by fusion with KOH/NaOH (65% yield) see (58); from di-p-chlorophenyl sulfide or di-p-chlorophenyl sulfoxide with S at 260–270° for 3–8 hrs. see (59); from p-chlorophenyl selenium trichloride by htg. at 184° (90% yield) see (12).]

[For form. of $\bar{\mathbf{C}}$ (together with o- and m-isomers in some cases) from C_6H_6 with Cl_2 in pres. of I_2 (15), $MoCl_5$ (60), $AlCl_3$ (61), or conc. H_2SO_4 (62), by electrolysis of susp. in AcOH+aq. HCl (69) or with aqua regia (70), see indic. refs.: from chlorobenzene (3:7903) with Cl_2+cat . at 600° (17) cf. (63), or with Cl_2 in pres. of $AlCl_3$ (65% yield (27)), $FeCl_3$ (55% yield (27)), or Al/Hg (66), see indic. refs.; from chlorobenzene (3:7903) with $Al_2S_2Cl_3$ (i.e., $2AlCl_3+S_2Cl_2$ (64)) $+SO_2Cl_2$ (64) (65), or by boilg. with $FeCl_3$ (67), or in small amt. by htg. with $PbCl_4.2NH_4Cl$ in s.t. at 210° (68), see indic. refs.]

[\bar{C} with Cl₂ (61) in pres. of Al/Hg (66) or \bar{C} with Al₂S₂Cl₈ (i.e., 2AlCl₃ + S₂Cl₂) + SO₂Cl₂ (64) gives (58% yield (64)) 1,2,4-trichlorobenzene (3:6420); \bar{C} , however, chlorinates less readily than o-dichlorobenzene (3:6055), and if their mixture or eutectic is chlorinated residual \bar{C} can be separated by fractional freezing (71) (72) (73). — \bar{C} with Cl₂ in pres. of Fe (74) or with Al₂S₂Cl₈ (i.e., 2AlCl₃ + S₂Cl₂) + SO₂Cl₂ as directed (64) gives (yields: 67% (64), 39% (74)) (75) 1,2,4,5-tetrachlorobenzene (3:4115). — \bar{C} with liq. Cl₂ + sunlight + cat. (76) (77) or \bar{C} in CCl₄ under 1% aq. NaOH in sunlight (76) adds 3Cl₂ yielding a mixt. of β - (m.p. 262° (76)) and α - (m.p. 89.6° (76)) p-dichlorobenzene hexachlorides (use as insecticide (77)). — For study of photochem. chlorination of \bar{C} see (78).]

[\bar{C} when pure can be recovered unchanged after boiling with liq. Br₂ (79); however, \bar{C} warmed with Br₂ in pres. of Fe (79) or htd. with Br₂ + NaNO₂ + fumg. H₂SO₄ in s.t. at 200° for 4 hrs. (80) gives (19% yield (79)) 2,5-dibromo-1,4-dichlorobenzene, ndls. from hot alc., m.p. 148° (79), 146° (80). — \bar{C} with excess Br₂ + AlCl₃ as directed (81) gives 2,3,5,6-tetrabromo-1,4-dichlorobenzene, m.p. 278-278.5° (81).]

[C passed over Pt spiral at bright red heat yields (82) 2,5,2',5'-tetrachlorobiphenyl, m.p. 84-85° (82). — C in EtOH at 55° in pres. of Adams' cat. (PtO₂) with excess H₂ at 3 atm. press. yields (83) cyclohexane (1:8405). — C in alc. KCN with NiCl₂ htd. in s.t. 20 hrs. at 260-270° gives (12% yield (84)) terephthalic acid (1:0910).]

[\bar{C} with Na + n-butyl chloride (3:7160) in xylene at 150° gives small yield (85) p-di-n-butylbenzene, b.p. 224-225.5° at 759 mm. (85). — \bar{C} with Mg + I₂ (0.25 equiv.) gives in 6 hrs. 58% yield (86) p-chlorophenyl MgCl.]

[\bar{C} with ethylene + AlCl₃ gives a mixt. (87) of mono-, di-, tri-, and tetra-ethyl-p-dichlorobenzenes.]

[\bar{C} (3 moles) with CHCl₃ (1 mole) + AlCl₃ gives (14% yield (88)) tris-(2,5-dichlorophenyl)methane, colorless cryst. from C_6H_6 , m.p. 206-208° (88). — \bar{C} with CCl₄ + AlCl₃ at room temp. (88) or in CS₂ (89) (90) gives (26% yield (88)) 2,5,2',5'-tetrachlorobenzophenone dichloride, m.p. 173-174° (89) (88); this with dil. alc. on boilg. or htg. in s.t. at 130° hydrolyzes to 2,5,2',5'-tetrachlorobenzophenone, colorless cryst. from alc., m.p. 128° (89) (90). — \bar{C} with CCl₄ + AlCl₃ at 55° for 10 hrs. presumably first yields tris-(2,5-dichlorophenyl)methyl chloride (not isolated) which then loses 1 HCl giving (23% yield (88)) 1,4,7-trichloro-9-(2,5-dichlorophenyl)fluorene (?), m.p. 179-180° (88).]

[C with acetyl chloride (3:7065) + AlCl₃ gives (91) 2,5-dichloroacetophenone, b.p. 251° at 756 mm., m.p. 14° (91) (oxime, m.p. 130°, via Beckmann rearr. with conc. H₂SO₄ gives acet-2,5-dichloroanilide, m.p. 133° (91)). — C with benzoyl chloride (3:6240) + AlCl₃ yields (91) (92) 2,5-dichlorobenzophenone, white ndls. from alc., m.p. 88° (91), 85-86° (92) (oxime, m.p. on slow htg. 207°, via Beckmann rearr. with conc. H₂SO₄ gives benz-2,5-dichloroanilide, m.p. 122° (91)). — C with o-chlorobenzoyl chloride (3:6640) + AlCl₃ gives (92) 2,2',5-trichlorobenzophenone, m.p. 145-147° (92). — C with 2,4-dichlorobenzoyl chloride + AlCl₃ gives 2,5,2',4'-tetrachlorobenzophenone, m.p. 176° (92).] — [Note that C fails to react with sym-dichlorodimethyl ether (3:5245).]

[\bar{C} with phthalic anhydride (1:0725) + AlCl₃ gives (59.3% (94), 27% (93)) o-(2,5-dichlorobenzoyl)benzoic acid, colorless pr. from C_6H_6 , m.p. 169° cor. (93), 167° (94); this prod. on ring closure with fumg. H_2SO_4 (94) or conc. H_2SO_4 (93) at 150° gives (yields: 83.5% (94), 83% (93)) 1,4-dichloroanthraquinone [Beil. VII-787, VII₁-(111)], or.-yel. ndls. from AcOH, m.p. 187.5° cor. (93), 186° (94). — Note that \bar{C} reacts with phthalic anhydride + AlCl₃ less readily than o-dichlorobenzene (3:6055) (use in sepn. of the two isomers (95)). — For corresp. condens. of \bar{C} with 3-sulfophthalic anhydride and 4-sulfophthalic anhydride in pres. of AlCl₃ see (96).]

[C on partial hydrol. with aq. MeOH alk., alk. carbonates, or best alk. earths in pres. of Cu or Cu salts at elevated temps. under press. gives in excellent yield (98) (99) (100) (101) (102) (103) (104) (105) p-chlorophenol (3:0475) (some phenol (1:1420) is also formed (102)); if the hydrolysis of C is carried further (100) (106) hydroquinone (1:1590) is also obtd.]—[For study of kinetics of reactn. of C with MeOH/alk. see (99) (107) (108).]

[C with anhyd. NH₃ in alc. in pres. of CuCl₂ + Cu under press. at 150-200° yields (109) p-chloroaniline [Beil. XII-607, XII₁-(304)]; C with conc. aq. NH₄OH in pres. of CuO under press. at 150-200° gives (110) (111) (112) (113) (114) p-phenylenediamine [Beil. XIII-61, XIII₁-(18)]. — [C with K diphenylamine at 240-245° gives (115) not only the expected N,N,N',N'-tetraphenyl-p-phenylenediamine, tbls. from acctone, m.p. 199-200°, but also by rearr. N,N,N',N'-tetraphenyl-m-phenylenediamine, m.p. 137.5-138°.]

[\bar{C} on mononitration, e.g., with 5 wt. pts. abs. HNO₃ at 0° (116) (99), with 2 wt. pts. HNO₃ (D=1.48) below 50° (120), or with 1.5 pts. of a mixt.contg.2 pts. HNO₃ (D=1.54) + 3 pts. conc. H₂SO₄ (117) (118) (119) at 70-100° for 30-60 min., yields 1,4-dichloro-2-nitrobenzene [Beil. V-245, V₁-(131)], cryst. from alc., m.p. 55° (120), 54.5° (99), 54° (119), 53° (116) (note close proximity of this m.p. to that of the initial \bar{C}).]

[C on dinitration, e.g., with 4 wt. pts. fumg. HNO₃ (D=1.52) + 10 wt. pts. conc. H₂SO₄ at b.p. for 5 hrs. (8) (121), or with 3 wt. pts. HNO₃ (D=1.52) + 7.5 wt. pts. conc. H₂SO₄ at b.p. for 2 hrs. (122), finally poured into aq., gives a mixt. contg. all three possible dinitrop-dichlorobenzenes; of these the chief prod. is 1,4-dichloro-2,6-dinitrobenzene [Beil. V-265, V₁-(138)], m.p. 106° (123) (119), 105-106° (122), 105° (121), obtd. by recrystn. (repeated if necessary) of the crude dinitration prod. from 30 pts. 95% alc. (121); the mother liquors contain the more soluble 1,4-dichloro-2,3-dinitrobenzene, m.p. 102-103° (122), 101.2° (119),

- 101° (121), and 1,4-dichloro-2,5-dinitrobenzene, m.p. 119° (122) (121) (124). For f.p. compn. data and diagrams of mixtures of the 2,6- and 2,3-dinitro-p-dichlorobenzenes see (119), of mixtures of the 2,6- and 2,5-dinitro-p-dichlorobenzenes see (121). Note also that the prod., m.p. 81°, formerly (8) supposed to be the 2,5-dinitro isomer, has since (121) been proved to be a compound of the 2,6- and 2,5-dinitro-1,4-dichlorobenzenes. The relative proportion of the three dinitration products varies with conditions (119) (121) (122) (124).]
- [\bar{C} on monosulfonation, e.g., with 1.5 wt. pts. fumg. H₂SO₄ (10–12% SO₃) at 140–150° for 45 min. (118) cf. (27), gives on pouring into aq. (85–90% yield (118)) 1,4-dichlorobenzene-sulfonic acid-2, cryst. from aq. as monohydrate (for derivs. see below). Note that \bar{C} is not sulfonated by conc. H₂SO₄ even at 210° (16) (dif. from o-dichlorobenzene (3:6055) and use in sepn. from \bar{C}); for removal of chlorobenzene (3:7903) from mixt. with dichlorobenzenes via sulfonation of former with 95% H₂SO₄ see (17). For use of reactn. prod. of \bar{C} with SO₃ as dye intermed. or for mothproofing of wool see (125). For reactn. of sodium p-dichlorobenzenesulfonate with fused NaOH to yield hydroquinone (1:1590) see (126).]
- [C with 5 moles ClSO₃H at 150° for 1 hr. (127) (128) gives (85% yield (127) (128)) 1,4-dichlorobenzenesulfonyl chloride-2, cryst. from lgr., m.p. 39° (127) (128), 38° (129), 36.8° (27) (corresp. amide, see below; corresp. sulfonanilide, m.p. 160° (128)); for use in prepn. of tetrachlorothioindigo see (130). C with 30 pts. ClSO₃H at 140° for 48 hrs. (128) gives both 1,4-dichlorobenzene-bis-(sulfonyl chloride)-2,6, m.p. 114° (corresp. bis-sulfonanilide, m.p. 215-217° dec. (128)) and 1,4-dichlorobenzene-bis-(sulfonyl chloride)-2,5, m.p. 182° (corresp. bis-sulfonanilide, m.p. not given). Note that C reacts with ClSO₃H much less easily than o-dichlorobenzene; for use in sepn. of the two isomers via formn. of o-dichlorobenzenesulfonyl chloride and sepn. from unchanged C by distn. see (131).]
 - D 1,4-Dichlorobenzenesulfonamide-2 (2,5-dichlorobenzenesulfonamide-1): cryst. from dil. alc., m.p. 179.5-180° u.c. (129), 181° (127), 185-186° (27). [From Č via treatment with ClSO₃H as directed (129) to 1,4-dichlorobenzenesulfonyl chloride-2 (see above) and subsequent conv. with (NH₄)₂CO₃ to desired sulfonamide.] [Note that, although the m.p. of this sulfonamide is practically identical with that from m-dichlorobenzene (3:5960), each depresses the m.p. of a mixt. with the other; the m.p.'s of the precursor sulfonyl chlorides, viz. 52-53° for the isomer from m-dichlorobenzene, 38° for that from Č, may also serve to distinguish them (129).] [For similar prepn. and use of 1,4-dichlorobenzenesulfonamide-2 see (132).]

3: 0985 18-CHLORO-OCTADECANOL-1 C₁₈H₃₇OCl Beil. S.N. 24 (ω-Chloro-n-octadecyl CH₂.(CH₂)₁₆.CH₂OH alcohol; ω-chlorostearyl alcohol) M.P. 53-54.5° (1)

Colorless crystals.

[For prepn. from α , ω -octadecamethylene glycol (m.p. 97-98°) with SOCl₂ + dimethylaniline in C₆H₆ (50% yield) see (1); note that a little 1,18-dichloro-octadecane with m.p. 54° (i.e., practically the same as $\bar{\mathbf{C}}$) is also formed.]

C is only slightly attacked by KOH (2).

D 18-Chloro-octadecyl N-phenylcarbamate: lfts. from ale. or lt. pet., m.p. 77° (1).

3: 9985 (1) Bennett, Gudgeon, J. Chem. Soc. 1938, 1679-1681. (2) Seck, Dittmar, Chem. Umschau Fette, Öle, Wachse, Harze 39, 226-229 (1932); Cent. 1933, I 1757; [C.A. 27, 703 (1933)].

3: 0990 1,2,3-TRICHLOROBENZENE Cl
$$C_6H_3Cl_3$$
 Beil. V - 203 (vic-Trichlorobenzene) C_1 C_1 V_1 -(112) V_2 -(156)

M.P.	54°	(1)	B.P. 218-219	(3)
	53-54°	(2) (3)		
	52.3-53.0°	(4)		
	52.4°	(5)		
	52°	(6)		
	50.8°	(7)		

Tbls. from alc.; eas. sol. CS_2 or C_6H_6 ; spar. sol. alc.; volatile with steam. [For use as component of mixtures for dif. inflammable electric insulating materials see (8).] [For thermal anal. of mixts. of \bar{C} with 1,2,4-trichlorobenzene (3:6420) and with 1,3,5-trichlorobenzene (3:1400) see (5).]

[For prepn. of C from 2,3,4-trichloroaniline [Beil. XII-626] with ethyl nitrite (3) or by diazotization and reaction with alc. (35% yield (4)), or from 3,4,5-trichloroaniline [Beil.

XII-630, XII₁-(313)] via diazotization (9) (6) and reaction with alc. (9), or by reduction to 3,4,5-trichlorophenylhydrazine and reaction of this with Fehling soln. (poor yield (6)) (5), see indic. refs.; for prepn. of \bar{C} from 2,3-dichloroaniline [Beil. XII-621] (7) or from 2,6-dichloroaniline [Beil. XII-626] (7) (4) via diazotization and use of Cu_2Cl_2 reaction see indic. refs.; for prepn. of \bar{C} from 4-chloro-3,5-diaminobenzenesulfonic acid-1 [Beil. XIV-718, XIV₁-(727)] via conv. to 3,4,5-trichlorobenzenesulfonic acid-1 and subsequently hydrolyzing the sulfonic acid group see (1).]

[For form. of \bar{C} (together with other prod.) from a mixt. of o- and p-dichlorobenzenes with Cl₂ (10), or from m-dichlorobenzene + AlCl₃ + Cl₂ (11), or from α -, β -, or γ -benzene-hexachlorides with alc. KOH (5), or from α -benzenehexachloride with pyridine or quinoline (5), see indic. refs.]

[Č with Cl₂ in pres. of Al/Hg yields (9) exclusively 1,2,3,4-tetrachlorobenzene (3:0655), m.p. 44-45° (9); Č with liq. Cl₂ in s.t. at room temp. for 7 days adds 6 atoms halogen yielding (12) 1,1',2,2',3,3',4,5,6-enneachlorocyclohexane (1,2,3-trichlorobenzene hexachloride), pr. from MeOH, m.p. 80° (12).]

[Č on hydrolysis with steam at 550-800° over cat. yields (13) pyrogallol (1:1555); for behavior of Č with NaOMe in McOH see (6) (14).]

 $\bar{\mathbf{C}}$ on mononitration, e.g., by soln. of $\bar{\mathbf{C}}$ (1 g.) in 5 ml. fumg. HNO₃ (D=1.49) (17), gives 100% yield (17) 1,2,3-trichloro-4-nitrobenzene [Beil. V-246], long colorless ndls. from alc., m.p. 56° (15) (7), 55-56° (17) (3) (note that the isomeric 1,2,3-trichloro-5-nitrobenzene [Beil. V-247, V₁-(131)] has m.p. 72°).

 \bar{C} on dinitration, e.g., \bar{C} (1 g.) refluxed 1 hr. with 5 ml. fumg. HNO₃ (D=1.49) + 5 ml. conc. H₂SO₄, then poured into aq. (17) (16), gives 100% yield 1,2,3-trichloro-4,6-dinitrobenzene, ndls. from hot alc., m.p. 92-93° (16) (17); this prod. (1 g). htd. 1 hr. at 100° with 5 g. aniline as directed (17) yields 1,3-dianilino-2-chloro-4,6-dinitrobenzene, cryst. from C₆H₆ or alc., m.p. 136-138° (17). [Note that an isomeric 1,2,3-trichloro-4,5-dinitrobenzene, cryst. from alc., m.p. 105-106° (16), has been obtd. by further nitration of 1,2,3-trichloro-5-nitrobenzene (mentioned in preceding paragraph).]

Č with chlorosulfonic acid as directed (17) gives 1,2,3-trichlorobenzenesulfonyl chloride-4, m.p. 64-65° u.c. (17), 65-66° (2); this prod. with (NH₄)₂CO₃ readily yields (17) 1,2,3-trichlorobenzenesulfonamide-4, m.p. 226-230° dec. u.c. (17).

3:0990 (1) I.G., Brit. 319,149, Oct. 10, 1929; French 661,490, July 25, 1929; Cent. 1930, I 740. (2) I.G., Brit. 287,178, May 9, 1928; Cent. 1929, II 352. 3:0995 1,1-Di-(p-CHLOROPHENYL)ETHANE

C₁₄H₁₂Cl₂ Beil

Beil. S.N. 479

M.P. 54-55° (1) B.P. 143-145° at 2 mm. (1)

Colorless cryst. from 90% AcOH. — Note that, when pure, neither solid \bar{C} nor its solns. snow any fluorescence either in visible or ultraviolet light. (1). — Note also that, although m.p. of \bar{C} is identical with that of its next lower homolog, viz., di-(p-chlorophenyl)methane (4,4'-dichlorodiphenylmethane) (3:1057), nevertheless the m.p. of their mixture is depressed to 40-50° (1).

[For prepn. of \tilde{C} from 1,1-di-(p-chlorophenyl)cthylene (3:2475) by cat. hydrogenation (62% yield) see (1); for formn. of \tilde{C} from chlorobenzene (3:7903) with acetylene in presence of AlCl₃ see (2), but note that by this method various undetermined impurities which show blue fluorescence are also formed (1).]

 \ddot{C} on oxidn. with $CrO_3/AcOH$ + trace of H_2SO_4 gives (1) 4,4'-dichlorobenzophenone (3:4270), m.p. 142-144°.

C does not (1) yield an addn. prod. with PkOH.

3:0995 (1) Grummitt, Buck, Becker, J. Am. Chem. Soc. 67, 2265-2266 (1945). (2) Cook, Chambers, J. Am. Chem. Soc. 43, 338 (1921).

CHAPTER IV

DIVISION A. SOLIDS

(3:1000-3:1499)

3:1000 $\gamma_1\gamma_1\gamma_2$ -TRICHLORO-n-BUTYRIC ACID $C_4H_5O_2Cl_3$ Beil. S.N. 162 $Cl_3C.CH_2.COOH$

M.P. 55° (1)

Colorless ndls. from hot aq.

[For prepn. of \bar{C} from γ, γ, γ -trichloro-*n*-butyronitrile (see below) by hydrolysis with conc. HCl at 60° for 6 hrs. see (1).]

—γ₂γ₂γ-Trichloro-n-butyronitrile: ndls. from pet. ether, m.p. 41° u.c.; b.p. 214-216° at 760 mm., 90-95° at 12 mm. (1). [From acrylonitrile with CHCl₃ in pres. of aq. trimethylbenzylammonium hydroxide at 0.5° for 24 hrs. (11% yield (1)).] [Note that this nitrile upon acid hydrolysis gives C̄, but upon alkalıne hydrolysis gives succinic acid (1:0530), m.p. 188-189° (1).]

— γ,γ,γ -Trichloro-*n*-butyramide: cryst. from toluene, m.p. 89-90° u.c. (1). [From γ,γ,γ -trichloro-*n*-butyronitrile (above) with 27% H₂O₂ + aq. NaOH at 40-45° for 5 hrs. (1).]

3:1000 (1) Bruson, Niederhauser, Riener, Hester, J. Am. Chem. Soc. 67, 601 (1945).

3:1010 3-CHLORO-2-HYDROXYBENZALDE- $C_7H_5O_2Cl$ Beil. VIII — HYDE CHO CHO CHO CHO CHO CHO CHO CHO CHO CHO

M.P. 55° (1) 54.5-55.5° (2) 54° (3) (4)

Long colorless ndls. from MeOH (1). — Readily sol. in usual org. solvents (1). — Volatile with steam [diff. from 3-chloro-4-hydroxybenzaldehyde (3:4065) (1)].

[For prepn. from o-chlorophenol (3:5980) with CHCl₃ + alk. (10-15% yield (1)) or via condensation with formalin + alk. to 3-chloro-2-hydroxybenzyl alc. and oxidn. of latter with Na m-nitrobenzenesulfonate + alk. (2) see indic. refs.; from 3-chloro-2-hydroxybenzoic acid (3-chlorosalicylic ac.) (3:4745) by reductn. with Na/Hg in pres. of H₃BO₃ see (4).]

C with satd. aq. NaHSO3 soln. yields NaHSO3 cpd. (1) (2).

C dissolves in aq. alk. with yel. color (4) (2).

C with aq. FeCl₃ yields violet-red color (2).

 \bar{C} is not nitrated by cold AcOH/HNO₃ soln. (1); but \bar{C} (2 g.) in AcOH (10 ml.) treated at 45° for 15 min. with soln. of 0.8 ml. conc. HNO₃ (D=1.42) in AcOH (4 ml.), then poured into aq., gives (1) 2.15 g. 3-chloro-5-nitro-2-hydroxybenzaldehyde, yel. ndls. from dil. alc., m.p. 129° (1).

The methyl ether of \bar{C} , viz., 3-chloro-2-methoxybenzaldehyde, is a liq., b.p. abt. 255°, f.p. 0° (1).

- 3-Chloro-2-hydroxybenzaldoxime: lfts. from dil. alc., m.p. 167-168° (2).
- --- 3-Chloro-2-hydroxybenzaldehyde phenylhydrazone: unrecorded.
- --- 3-Chloro-2-hydroxybenzaldehyde p-nitrophenylhydrazone: unrecorded.
- --- 3-Chloro-2-hydroxybenzaldehyde 2,4-dinitrophenylhydrazone: unrecorded.
- 3-Chloro-2-hydroxybenzaldehyde semicarbazone: cryst. from 50% AcOH, m.p. 240-243° (2).

3:1010 (1) Davies, Rubinstein, J. Chem. Soc. 123, 2850 (1923). (2) Hanus, J. prakt. Chem. (2) 158, 263-264 (1941). (3) Duff, J. Chem. Soc. 1941, 547-550. (4) Bayer and Co., Ger. 228,838, Nov. 22, 1910; Cent. 1911, I 51.

Ndls. from hot aq. or pet. ether. Spar. sol. cold but more eas. sol. hot aq.; eas. sol. alc., ether, CHCl₃, CS₂. Volatile with steam.

[For prepn. of \bar{C} from o-cresol (1:1400) with Cl_2 (7) (4) (1) in CCl_4 (61% yield (2)) in CCl_4 in pres. of Fe (8) or in pres. of PCl_5 in sunlight at elevated temp. (8), with Cl_2 in NaOH soln. at room temp. (5), or with SO_2Cl_2 (3), see indic. refs.; for formn. from 2-methylphenoldisulfonic acid-4,6 (6) in nitrobenzene with Cl_2 (other products are also formed) see (6).]

 $[\bar{C} \text{ with dry NH}_3 \text{ gas at room temp. (9) forms a cpd., } \bar{C}.2NH_3 \text{ (9); } \bar{C} \text{ on evapn. of alc. NH}_3 \text{ soln. does not give an NH}_4 \text{ salt but is recovered unchanged (dif. from 2,6-dichloro-4-methylphenol (3:0400) q.v.) (7).}$

 $[\bar{C}$ (1 pt.) in 2 pts. ice-cold HNO₃ (D=1.48) stood 24 hrs. gives (37% yield (2)) a prod. of compn. $C_7H_6O_6N_2Cl_2$, white ndls. from dry ether by pptn. with pet. ether, m.p. 109° dec. (2).

[\bar{C} with boilg. dil. HNO₃ oxidizes (7) to oxalic acid (1:0445); \bar{C} on oxidn. with $K_2Cr_2O_7$ + dil. H_2SO_4 gives (4) 6-chloro-2-methylbenzoquinone-1,4 (6-chloro-p-toluquinone) [Beil. VII-650, VII₁-(353)], yel. ndls., vol. with steam, m.p. 90° (4); \bar{C} digested with aqua regia for $1\frac{1}{2}$ hrs. at 100° gives (16% yield (5)) 3,5,6-trichloro-2-methylbenzoquinone-1,4 (trichloro-p-toluquinone) [Beil. VII-651, VII₁-(354)], yel. lfts. from alc., m.p. 233° (5); \bar{C} with CrO₃/AcOH gives a mixt. (4) of chlorinated quinones.]

[\bar{C} does not react with PCl₅ (10); \bar{C} on monosulfonation with fumg. H₂SO₄ (65% SO₃) at 50° yields (11) 4,6-dichloro-2-methylphenolsulfonic acid-3; for condensation of \bar{C} with benzaldehydesulfonic acid-4 and use as motheroofing agt. see (12).]

[C in MeOH/KOH refluxed 6½ hrs. with MeI (74% yield (3)), or C in aq. alk. with Me₂SO₄ (1) gives the corresp. methyl ether (4,6-dichloro-2-methylanisole), m.p. 33° (1), 29-30° (3), b.p. 230° (1); C in aq. alk. soln. treated with Et₂SO₄ gives (1) corresp. ethyl ether (4,6-dichloro-2-methylphenetole), m.p. 27.5° (1).]

- ① 4,6-Dichloro-2-methylphenyl acetate: m.p. 28.5°, b.p. 254° (1). [From Č with excess Ac₂O + a drop of conc. H₂SO₄ htd. 4 hrs. at 100° (1).]
- (1). [From C with benzoyl chloride (1).]

3:1025 3-CHLORO-4-METHYLPHENOL OH C₇H₇OCl Beil. VI -402 VI₁— VI₂—

M.P. 55° (1) (2) B.P. 228° at 760 mm. (2) 229° at 735 mm. (1)

Long colorless ndls., markedly sol. in aq. and volatile with steam (1). — Eas. sol. alc., ether, or C_6H_6 .

[For prepn. (77% yield) from 3-chloro-4-methylaniline [Beil. XII-988] via diazo reaction see (1).]

Č dislvd. in 20% NaOH and shaken with (CH₃)₂SO₄ gives 95% yield of corresponding methyl ether, viz., 3-chloro-4-methylanisole, b.p. 212° (1). [Oxidn. of this ether with dil. aq. KMnO₄ yields (1) 2-chloro-4-methoxybenzoic acid [Beil. X-175], ndls. from aq., m.p. 208° (1).]

3:1025 (1) Ullmann, Wagner, Ann. **355**, 367-368 (1907). (2) Badische Anilin und Soda-fabrik, Ger. 156,333, Nov. 14, 1904; Cent. **1904**, II 1672.

3:1040 o-XYLYLENE (DI)CHLORIDE
$$(\omega,\omega'$$
-Dichloro-o-xylene) CH_2Cl $C_8H_8Cl_2$ Beil. V - 364 V_1 — CH_2Cl V_2 -(283)

Cryst. (from pet. eth.). — Sublimes. — Sol. alc., ether, CHCl₃, lgr. Powerful lachrymator.

[For prepn. from o-xylyleneglycol + boilg. conc. HCl see (3); from o-xylene (1:7430) + PCl₅ at 190° see (3) (4); from o-xylene (1:7430) + Cl₂ in sunlight see (1); for formn. of \tilde{C} (13%) during chloromethylation of benzyl chloride (3:8535) see (5).]

C on oxidn, with KMnO₄ yields phthalic ac. (1:0820).

3:1040 (1) Radziewanowski, Schramm, Cent. 1898, I 1019. (2) Quelet, Bull. soc. chim. (4) 53, 223 (1934). (3) Colson, Ann. chim. (6) 6, 108-109 (1885). (4) Colson, Gautier, Ann. chim. (6) 11, 22 (1887). (5) Kulka, Can. J. Research 23-B, 107 (1945).

Transparent cryst. (1) (2) from pet. eth. — Very spar. sol. cold aq.; pronounced phenolic odor (1).

[For prepn. from m-cresoldisulfonic acid by chlorination see (2); from 2-nitro-3-methylphenol via 2-amino-3-methylphenol see (2); from 2-chloro-3-methylanisole by boilg. with HI see (1).]

Č treated with $(CH_3)_2SO_4 + aq$. NaOH gives its methyl ether, 2-chloro-3-methylanisole, pr. from light pet. eth., m.p. 24.2°, b.p. 218.5° (1). [This methyl ether on oxidn. with dil. KMnO₄ (7½ hrs. for 5 g.) gave (1) 2-chloro-3-methoxybenzoic acid, stout colorless rectangles, m.p. 160.5° (1), 160° (3), Neut. Eq. 186.5.]

- **D** 2-Chloro-3-methylphenyl benzoate: from $\tilde{C} + BzCl + pyridine$, pr. from alc., m.p. 55-56° (2). [Note that this value is numerically the same as \tilde{C} and that the deriv. must be distinguished from orig. \tilde{C} , e.g., by mixed m.p. or behavior with alk.]
- 0 2-Chloro-3-methylphenyl benzenesulfonate: from C + benzenesulfonyl chloride + pyridine; pl. from alc., m.p. 58-58.5° (2). [See note for above deriv.]
- **D** 2-Chloro-3-methylphenyl p-toluenesulfonate: from $\bar{C}+p$ -toluenesulfonyl chloride + pyridine; pr. from alc. m.p. 96° (2). [Note that this deriv. does not distinguish \bar{C} from 6-chloro-3-methylphenol (3:0700) or 4-chloro-3-methylphenol (3:1535).]

3:1055 (1) Gibson, J. Chem. Soc. 1926, 1424-1428. (2) Huston, Chen, J. Am. Chem. Soc. 55, 4214-4218 (1933). (3) Hodgson, Beard, J. Chem. Soc. 1926, 150.

3:1057 4,4'-DICHLORODIPHENYL- C₁₃H₁₀Cl₂ Beil. V - 590 W₁— CH₂ CH₃H₁₀Cl₂ Beil. V - 590 V₁— V₂-(501) M.P. 55-56° (1) B.P. 337° at 760.5 mm. (5) 55° (2) (3) (4) (5) 186-190° at 18 mm. (1)

208-210° at 15 mm.

(3)

Colorless ndls, from MeOH.

54-55° (7)

[For prepn. of \bar{C} from 4,4'-dichlorobenzophenone (3:4270) by reduction with conc. HI + red P in boilg. AcOH (4) or as by-prod. of reduction with Zn dust + AcOH + dil. H₂SO₄ (5) see indic. refs.; from 4,4'-diaminodiphenylmethane [Beil. XII-238, XII₁-(71)] by tetrazotization and subsequent use of Cu₂Cl₂ reaction (50% yield) see (1).]

[For prepn. of \bar{C} from chlorobenzene (3:7903) by action of sym-dichloro-dimethyl ether (3:5245) in pres. of ZnCl₂ (3) or better (alm. 100% yield (3)) conc. H₂SO₄ at 40°, or by action in pres. of H₂SO₄ of various other formaldehyde derivs. (6), see indic. refs.; from p-chlorobenzyl chloride (3:0220) with chlorobenzene (3:7903) + conc. H₂SO₄ (67% yield (3)) see indic. refs.]

[For prepn. of $\bar{\mathbb{C}}$ from "DDT" (3:3298), from 1,1-dichloro-2,2-bis-(p-chlorophenyl)-ethylene (3:2438), or from di-(p-chlorophenyl)acetic acid (3:4612) by action of KOH in ethylene glycol refluxed 8-10 hrs. (alm. 100% yield) see (2).]

[For form. of \bar{C} (21% yield) from hydrazone of 4,4'-dichlorobenzophenone (3:4270) via Wolff-Kishner reduction see (7).]

C on oxidn. with CrO₃/AcOH readily gives (3) 4,4'-dichlorobenzophenone (3:4270),

m.p. 145° (3).

 \tilde{C} on dinitration by addn. to 8 pts. fumg. HNO₃ (D=1.5) with water cooling gives (1) 3,3'-dinitro-4,4'-dichlorophenylmethane, white pl. from AcOH, m.p. 198-199° (1), 196° (3); this prod. with piperidine splits out 2 moles HCl giving (1) 3,3'-dinitro-4,4'-dipiperidinodiphenylmethane, m.p. 183-184° (1). — [Note, however, that \tilde{C} dislvd. in 9-10 wt. pts. conc. HNO₃ (D=1.42) and kept at 100° for 1 hr. (3) gives some of the above dinitro derivative but is also in part oxidized and nitrated (or vice versa) with formn. of 3,3'-dinitro-4,4'-dichlorobenzophenone, ndls. from alc., m.p. 132° (3); see also text of 4,4'-dichlorobenzophenone regarding nitration.]

3:1058 β,β-DICHLOROPROPIONIC ACID

 $C_3H_4O_2Cl_2$

Beil. II -252

130

Cl₂CH.CH₂.COOH

M.P. 56° (1)

Colorless cryst., eas. sol. aq., alc., ether, C6H6, or CHCl3.

[For prepn. of \bar{C} from β -chloroacrylic acid (3:2240) by addn. of 1 HCl with 40% aq. HCl in s.t. at 80-85° for 35-40 hrs. (yield not stated) see (1).

 \bar{C} with alc. KOH splits out 1 HCl giving (1) β -chloroacrylic acid (3:2240).

 \bar{C} with SOCl₂ at 75-80° for 3-4 hrs. gives (2) β,β -dichloropropionyl chloride (3:9032-A).

- Methyl β , β -dichloropropionate: unreported.
- Ethyl β,β-dichloropropionate: b.p. 171-175° (1). [From C in EtOH with dry HCl (1).]
- \mathfrak{D} β,β -Dichloropropionamide: ndls. from CHCl₃, m.p. 140° (1). [From ethyl β,β -dichloropropionate (above) with conc. aq. NH₄OH on shaking at room temp. (1).]
- B.B-Dichloropropionanilide: unreported.
- β_{β} -Dichloropropion- β -toluidide: unreported.

3:1058 (1) Otto, Ann. 239, 266-272 (1887). (2) Leimu, Ber. 70, 1050 (1937).

3:1060 2,3,5-TRICHLOROBENZALDEHYDE

C7H3OCl3

Beil. S.N. 635

M.P. 56° (1)

Colorless and s. (from dil. alc.) with characteristic pungent odor. — Volatile with steam. — [Note that a patent abstract gives m.p. as 75-76° (2).]

[For prepn. of \bar{C} from 3-amino-2,5-dichlorobenzaldehyde (presumably by diazotization and use of Cu₂Cl₂ reaction) see {1}.]

 \tilde{C} on oxidn. with neutral KMnO₄ gives (1) 2,3,5-trichlorobenzoic acid (3:4485), m.p. 162-163°.

 \bar{C} with PCl₅ should give 2,3,5-trichlorobenzal (di)chloride, but this compd. is unreported in the literature.

- 2,3,5-Trichlorobenzaldoxime: unreported.
- 2,3,5-Trichlorobenzaldehyde phenylhydrazone: unreported.
- ---- 2,3,5-Trichlorobenzaldehyde p-nitrophenylhydrazone: unreported.
- 2,3,5-Trichlorobenzaldehyde 2,4-dinitrophenylhydrazone: unreported.

3:1060 (1) Hodgson, Beard, J. Chem. Soc. **1927**, 2381–2382. (2) Chem. Fabrik Griesheim-Elektron, Brit. 251,511, May 27, 1926; Cent. **1926**, II 2355; [C.A. **21**, 1361 (1927)]; French 603,-650, April 20, 1926; Cent. **1926**, II 2355; not in C.A.

M.P. 56-57° (1) (4) B.P. 118-121° (1) 55-56° (2) 96-97.5° (2)

Cryst. from C₆H₆ (3). — Eas. sol. aq. or ether; sol. CS₂.

[For prepn. of \bar{C} from dichloroacetaldehyde (3:5180) with a limited amt. of cold aq. see (2); for formn. of \bar{C} from α,β,β -trichloroethyl ethyl ether with aq. see (2); for formn. of \bar{C} as by-product of actn. of Cl_2 on paraldehyde in prepn. of butyrchloral (3:5910) see (2); for formn. of \bar{C} from chloral hydrate with Al/Hg + aq. see (5).]

C with conc. H₂SO₄ yields (3) dichloroacetaldehyde (3:5180), b.p. 89°.

3:1085 (1) Denaro, Gazz. chim. ital. 14, 119-120 (1884). (2) Oddo, Mameli, Gazz. chim. ital. 33, II 398-399 (1903). (3) Friedrich, Ann. 206, 251-254 (1880). (4) Ingold, J. Chem. Soc. 125, 1537 (1924). (5) Deodhar, J. Indian Chem. Soc. 11, 84 (1934).

[See also 2-chlorohydroquinone (3:3130).]

Pale yel. cryst.; eas. sol. aq., alc., ether, $CHCl_3$. — Volatile even at ord. tem. — Gradually dec. by light (3) (for study of photochem. decompn. in alc. see (12)). — Sol. in conc. H_2SO_4 on warming with brown black color.

[For prepn. of \tilde{C} from 2-chlorohydroquinone (3:3130) by oxidn. with NaClO₃ + H₂SO₄ + V₂O₅ in AcOH (92% yield (13)), with K₂Cr₂O₇ + H₂SO₄ (yield: 89% (14), 84% (1)) (7), with MnO₂ + dil. H₂SO₄ (56% yield (1)), or with PbO₂ in C₆H₆ (2) see indic. refs.; from 2-chloro-4-aminophenol [Beil. XIII-510, XIII₁-(181)] by oxidn. with K₂Cr₂O₇ +

H₂SO₄ (68% yield (8)) (10) (15) see indic. refs.; from benzoquinone-1,4 (1:9025) in CCl₄ with ⅓ mole HCl gas see (9); for formn. of Č (together with other prods.) from oxidn. of copper salt of quinic acid [Beil. X-535, X₁-(270)] with MnO₂, NaCl + dil. H₂SO₄ see (16).]

[For use of C as vulcanization accelerator see (17); for use as seed disinfectant see (18);

for study of bactericidal action see (19).]

 $\bar{\mathbb{C}}$ on reductn. with aq. SO₂ gives (16) (7) 2-chlorohydroquinone (3:3130) (note, however, that $\bar{\mathbb{C}}$ in dil. aq. NaOH under N₂ with SO₂ is in part reduced to 2-chlorohydroquinone and in part sulfonated (20)). [For studies on oxidn.-reductn. potential of system $\bar{\mathbb{C}}$ + 2-chlorohydroquinone (3:3130) see (1) (2) (3) (21) (22) (23) (24).] — $[\bar{\mathbb{C}}$ with 2-chlorohydroquinone (3:3130) yields (1) (16) (25) the corresp. quinhydrone, monohydrate, violet pr. with green shimmer, m.p. 70-72° (25), anhydrous form, m.p. 93-94° (25), 67° (1); $\bar{\mathbb{C}}$ with hydroquinone (1:1590) gives (25) (6) corresp. quinhydrone, dark green ndls. from alc., m.p. 132-133° (25), 130-135° (6).]

[\bar{C} in CHCl₃ with HCl gas (7) (26) or \bar{C} with hot conc. HCl (83% yield (10)) gives only 2,5-dichlorohydroquinone (3:4690), but \bar{C} in ether with HCl gas (26) or \bar{C} dislvd. in cold dil. HCl (D=1.10) (26) gives both 2,3-dichlorohydroquinone (3:4220) and 2,5-dichlorohydroquinone (3:4690); \bar{C} refluxed with conc. HBr gives (27) 2-chloro-5-bromohydroquinone [Beil. VI-853], ndls. m.p. 171-172° (28) (diacetate, m.p. 145-146° (28)); \bar{C} in alc. with KCN + H₂SO₄ gives in good yield (29) 3,6-dihydroxyphthalonitrile (2,3-dicyanohydroquinone) [Beil. X-551].]

[C with Ac₂O + trace H₂SO₄ yields (29) a chloro-hydroxyhydroquinone triacetate, ndls. from alc., m.p. 96-97° (29); C with AcCl gives (28) 2,5-dichlorohydroquinone diacetate, m.p. 141°; C with AcBr gives (28) 2-chloro-5-bromohydroquinone diacetate, m.p. 145-146° (28).]

[\tilde{C} with 2,3-dimethylbutadiene-1,3 (1:8050) gives an adduct which upon oxidn. yields (30) 2-chloro-6,7-dimethylnaphthoquinone-1,4; for reactn. of \tilde{C} with diazotized aniline see (31); for addn. prods. of \tilde{C} with hexamethylbenzene (1:7265) see (5).]

[Č in alc. or AcOH on warming with aniline gives (32) 2,5-dianilinobenzoquinone-1,4 [Beil. XIV-138, XIII₁-(413)], red-br. scales, m.p. 345° u.c.]

[C in dil. alc. with NH₂OH.HCl as directed (33) gives 2-chlorobenzoquinone-1,4-monoxime-4 (purified (with difficulty) by conv. to the mixt. of stereoisomeric oxime acetates followed by hydrolysis), m.p. 142° (34), 148° dec. (35); this prod. by special treatment yields a dioxime [Beil. VII-632].]

 \tilde{C} in cold dil. alc. with semicarbazide HCl gives (36) 2-chlorobenzoquinone-1,4-semi-carbazone-4, deep yel. cryst. from acetone + pet. ether, m.p. 185° dec. (36); this prod. on boilg. with dil. aq. NaOH yields o-chlorophenol (3:5980) + N₂ + CO₂ + NH₃ (36); \tilde{C} does not give a bis-semicarbazone (36).

Lifts. from pet. ether (5), alc. (1) (5), or ether (2); eas. sol. in org. solv. except lgr. — \bar{C} on distn. even under reduced press. loses HCl with partial conversion (2) to phenyl vinyl ketone; nevertheless in small amts. of less than 10 g. \bar{C} may be distd. below 2 mm. (3); in general, however, unnecessary htg. of \bar{C} should be avoided (4).

[For prepn. of \bar{C} from β -chloropropionyl chloride (3:5690) with $C_6H_6+AlCl_3$ (yield: 90% (1), 80–90% (6), 65% (5)) see indic. refs. (note, however, that this method is best suited for small runs (6) since with large units much ω -benzylacetophenone [Beil. VII-444, VII₁-(237)], m.p. 72°, is also formed (6) (4); furthermore that \bar{C} prepd. by this method melts at 49° even when white, unless it is treated with decolorizing carbon (3); for prepn. from benzoyl chloride (3:6240) + ethylene + $AlCl_3$ (87-92% yield) in special apparatus see (3); for prepn. of \bar{C} from phenyl vinyl ketone + HCl gas in dry ether see (2); for formn. of \bar{C} from ethyl phenyl ketone (propiophenone) (1:5525) + Cl_2 see (7).]

[\bar{C} htd. 15-30 min. in AcOH with 1½ moles NaOAc or KOAc, then poured into aq. and neutralized with K₂CO₃, gives (8) β -acetoxypropiophenone, lfts. from MeOH, m.p. 53-54° (8); \bar{C} in hot alc. treated with KOAc, then with aq. NaCN, gives (65% yield (9)) β -cyanopropiophenone, lfts. from alc., m.p. 76° (2,4-dinitrophenylhydrazone, m.p. 141°; corresp. β -benzoylpropionic acid, m.p. 116° (9)).]

[\bar{C} under certain circumstances reacts as potential phenyl vinyl ketone: e.g., \bar{C} + KOAc in hot MeOH treated with phenyl-nitromethane + NaOMe gives (82% yield (10)) (presumably by addn. to phenyl vinyl ketone) γ -nitro- γ -phenylbutyrophenone, ndls. from C_6H_6 + pet. eth. or from MeOH, m.p. 72° (10); similarly \bar{C} + KOAc in hot MeOH treated with desoxybenzoin (1:5165) + NaOMe gives (55% yield (6)) 1,2,5-triphenylpentanedione-1,5, m.p. 95° (monoxime, m.p. 131°; dioxime, m.p. 162°; 2,4-dinitrophenylhydrazone, m.p. 221°) (6).]

 \bar{C} in AcOH reduced with H_2 + Adams cat. gives (11) 3-chloro-1-phenylpropanol-1, b.p. 130-132° at 8 mm. (p-nitrobenzoate, m.p. 62-63°) (11).

[For study of rate of reactn. of \bar{C} with KI in acctone see (5); for study of \bar{C} with Na + liq. NH₃ see (12); for behavior of \bar{C} with anthrone see (13) (14) (15); for reactn. of \bar{C} with C_6H_5MgBr yielding ω -benzylacetophenone (β -phenylpropiophenone) (cf. above) see

(16) (2); for reactn. of \bar{C} with sodium benzenesulfinate giving (68% yield) β -(benzenesulfonyl)propiophenone, m.p. 98° see (17).]

 \tilde{C} htd. with aq. + aniline for 30 min. at 100° gives (4) β -anilinopropiophenone, pl. from alc., m.p. 111-112° (4); note, however, that \tilde{C} htd. with aniline + aniline HCl yields (4) 4-phenylouinoline.

[C in MeOH boiled 3 hrs. with hydrazine hydrate (87%) gives (28% yield (18)) 3-phenylpyrazoline-2, b.p. 164° at 17 mm., m.p. 44-45° (18) (1-nitroso deriv., m.p. 152.5-153.5°; 1-carbomethoxy deriv., m.p. 123-124°; 1-carbothoxy deriv., m.p. 72°) (18). — C (or phenyl vinyl ketone) with phenylhydrazine yields by ring closure (19) 1,3-diphenyl-pyrazoline-2 [Beil. XXIII-153], m.p. 152-153° (19).]

[$\bar{\mathbf{C}}$ htd. in alc. with NH₂OH.HCl + NaOH gives very small yield (8) corresp. oxime, m.p. 56-58°; from the mother liquor, however, is obtd. (8) as a result of ring closure 3-phenylisoxazoline, tbls. from lgr. m.p. 66-67°, which is the sole product starting from β -acetoxypropiophenone (above); another by-product of oximation is N,N-bis-(β -benzoylethyl)hydroxylamine dioxime, m.p. 154-155° (8).]

- β-(Phthalimido) propiophenone: cryst. from alc., m.p. 130° (1). [From C + K phthalimide in 68% yield on htg. in s.t. for 1 hr. at 130-140° (1); on hydrolysis with fumg. HCl in AcOH in s.t. at 145-150° for 1 hr. this prod. gives 95% yield (1) β-aminopropiophenone hydrochloride, cryst. from abs. alc., m.p. 128° (1).]
- ① 1-Methyl-3-carbohydrazidopyridinium p-toluenesulfonate: cryst. from alc., m.p. 171° cor. (20). [From Č + nicotinic hydrazide/methyl p-toluenesulfonate addn. prod. as directed (20).]

3:1130 p-METHYLPHENACYL CHLORIDE C_9H_9OCl Beil. VII - 309 (Chloromethyl p-tolyl ketone, CH_3 CO.CH₂Cl VII_1 -(165) ω -chloro-p-methylacetophenone)

M.P. 57-58° (1) (5) B.P. 260-263° (2) 55.5-56° (2) (3) 260-265° sl. dec. (3) 54.5-55° (4) 113° at 4 mm. (4)

Ndls. from alc.; eas. sol. alc., ether.

[For prepn. from toluene (1:7405) + chloroacetyl chloride (3:5235) + AlCl₃ see (2) (3); from toluene + chloroacetic acid anhydride (3:0730) + AlCl₃ (46-59% yield) see (4).]

C on oxidn. with alk. KMnO₄ gives terephthalic ac. (1:0910) (2).

 \bar{C} with NaI in acetone gives p-methylphenacyl iodide, ndls. from alc., m.p. 42-43° (11).

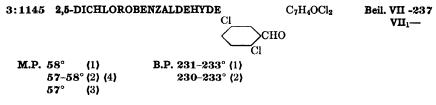

C refluxed with alc. KOAc yields (2) p-methylphenacyl acetate [Beil. VIII-113], ndls from alc., m.p. 83-83.5° (2), 85-86° (1).

 \bar{C} dislyd. in alc. warmed at 60° with Na₂S.9H₂O dislyd. in aq. gives (5) (73% yield (6)) bis-(p-methylphenacyl)sulfide, pale yel. ndls. from alc., m.p. 88° (5); 88.8-89.3° (6). [For detn. of \bar{C} by titration of residual chloride ion from this reaction see (5).]

[For reactions of \bar{C} with phenol + KOH + Cu see (7); with phenyl-p-bromophenyl-, p-nitrophenyl-, o-tolyl-, and p-tolyl-hydrazines see (5); with Br₂ see (8); with KCN or KSCN see (9); with alc. NaOEt see (10).]

(10) Almström, Ber. 47, 848-849 (1914).

(11) Jacobs, Heidelberger, J. Biol. Chem. 21, 456 (1915).

Ndls. from alc. (4). — Very eas. sol. alc., ether, CHCl₃, C₆H₆, CS₂, AcOH (4). — Eas. volatile with steam (4). — Sol. in conc. H₂SO₄ with olive-yel. color; repptd. in cryst. form on dilution (4) (8).

[For prepn. of \bar{C} from benzaldehyde (1:0195) by chlorination in presence of SbCl₅ + I₂ see (5) (1) (9); from 2,5-dichlorotoluene (3:6245) by chlorination to 2,5-dichlorobenzal (di)chloride (3:0490) (m.p. 42°) and hydrolysis of the latter with CaCO₃ + H₂O see (1); from 5-nitro-2-chlorobenzaldehyde via reduction to 5-amino-2-chlorobenzaldehyde followed by diazotization + use of CuCl see (6).]

 \bar{C} with satd. aq. NaHSO₃ soln. yields a cpd., \bar{C} .NaHSO₃ (5), ndls. fairly eas. sol. aq. but dissociating on warming into \bar{C} + aq. (5).

 \bar{C} on oxidn. with KMnO₄ (2) (4) yields 2,5-dichlorobenzoic ac. (3:4340), m.p. 152° (2), 152-153° (4). — \bar{C} with 50% aq. KOH (5) (1) (6) undergoes Cannizzaro reactn. giving (90% yield (6)) 2,5-dichlorobenzyl alc., cryst. from C₆H₆, m.p. 80° (1) (6), and (84% yield (7)) 2,5-dichlorobenzoic ac. (3:4340), cryst. from aq., m.p. 155° (5) (7). — \bar{C} on reductn. with 4% Na/Hg in alc. yields (1) 2,5-dichlorobenzyl alc., m.p. 80° (1).

Č with PCl₅ (3) gives (78% yield (3)) 2,5-dichlorobenzal (di)chloride (3:0490), b.p. 118-120° at 14 mm., m.p. 42° (8), 43° (3).

C on mononitration as specified (5) gives (100% yield (9)) a mixt. of two isomers; by recrystallization from MeOH (9) or EtOH (5) this mixt gives (62% yield (9)) 2,5-dichloro-6-nitrobenzaldehyde, lfts. or ndls., m.p. 137° (5); the other more soluble isomer is 2,5-dichloro-3-nitrobenzaldehyde (10), m.p. 66.5-67° (5). [The latter yields a phenylhydrazone, or. ndls., m.p. 171°, a p-nitrophenylhydrazone, deep or. ndls., m.p. 290-292° dec., and on oxidn. with alk. KMnO₄ yields 2,5-dichloro-3-nitrobenzoic ac., colorless ndls. from AcOH, m.p. 220° (10).]

[For conversion of Č to 2,5-dichlorostyrene (12) (13) via reaction with MeMgX giving (83% yield (12)) 2,5-dichlorophenyl-methyl-carbinol and dehydration of latter with KHSO₄ (37% yield (12)) see indic. refs.]

Č htd. with NaOAc + Ac₂O for 8 hrs. at 180-200° gives (78% yield (11)) 2,5-dichlorocinnamic ac., colorless cryst. from dil. alc. or from AcOH, m.p. 194.5° cor. (11).

Č in alc. boiled a few minutes with aniline (1 mole) gives (5) 2,5-dichlorobenzal anil, lfts. from alc., m.p. 71.5-72° (5).

- 2.5-Dichlorobenzaldoxime: ndls. from dil. alc., m.p. 127.5-128° (5).
- 2,5-Dichlorobenzaldehyde phenylhydrazone: cryst. from alc., m.p. 104-105° (5).
- --- 2,5-Dichlorobenzaldehyde p-nitrophenylhydrazone: unrecorded.
- 2.5-Dichlorobenzaldehyde 2.4-dinitrophenylhydrazone: unrecorded.
- 2,5-Dichlorobenzaldehyde semicarbazone: unrecorded.

(23) (24)

MISCELLANEOUS PHYSICAL PROPERTIES OF C

POLYMORPHISM OF C

Note that unlike chloroacetic acid (3:1370) \bar{C} does not exhibit polymorphism [however, for a possible unstable form melting about 50° see (10)].

CRYOSCOPIC CONSTANT OF C

[Molal f.p. constant for \tilde{C} is 12.07° (for 1000 g. \tilde{C}) (32); for use of \tilde{C} as cryoscopic solvent see (17).]

Association of C

[For studies on extent of association of \tilde{C} in vapor as function of temp. (28), in C_6H_6 soln. (33) (34), in liq. HF (35) (36), in phenol (37), or in p-chlorotoluene (3:8287) (42), see indic. refs.]

HEAT OF COMBUSTION OF C

[For studies on heat of combustion of \bar{C} see (38) (39) (40) (41).]

EXCHANGE REACTIONS

[For study of behavior of \bar{C} with H_2O^{18} see (43).]

Adsorption of C by Various Adsorbents

[For studies on adsorption of \bar{C} from aqueous solns. by various forms of carbon (44) (45) (46) (47) (48) (49), by silica gel (46), by filter paper (50), by hide-powder (51), by viscose (52), by synthetic resins (53), by freshly pptd. Fe(OH)₃ (54), by metastannic acid (55), see indic. refs.]

[For studies on adsorption of C from non-aqueous solvents by wood charcoal (56), or from aq. alc. by charcoal (57), see indic. refs.]

DISTRIBUTION OF C BETWEEN SOLVENTS

[For data on distribution of \bar{C} between aq. and ether at 25° (58) (59); between aq. and amylene at 22° (60) cf. (61); between aq. and C_6H_6 (60) (61) (62) cf. (63); between aq. and toluene at 25° (64); between aq and isopropylbenzene (cumene) at 25° (64); between aq. and n-AmOH at 25° (64); between aq and iso-AmOH at 25° (64); between aq and olive oil at 25° and 37° (65), see indic refs.]

[For data on distribution of C between aq. and nitrobenzene at 25° (62) (64), between aq. and o-nitrotoluene at 25° (64) (68), see indic. refs]

[For data on distribution of \tilde{C} between aq. and $CHCl_3$ (3:5050) at 25° (62) (64); between aq. and CCl_4 (3:5100) at 25° (62) (64); between aq. and EtBr at 25° (64); between aq. and MeI at 25° (64) (69), see indic. refs.]

[For data on distribution of \bar{C} between aq. and CS_2 at 25° (62); between acetone and glycerol at 25° (66); for distribution of \bar{C} between aq. and mixtures of C_6H_6 + nitrobenzene (67); between aq. and mixtures of C_6H_6 + cH_6 + cH_6 + cH_6 (67), see indic. refs.]

BINARY SYSTEMS CONTG. C

Azeotropic Systems

[$\bar{\mathbf{C}}$ with pentachloroethane (3:5880) forms a const.-boilg. mixt., b.p. 161.8° at 760 mm., contg. 3.5 wt. % $\bar{\mathbf{C}}$ (25); $\bar{\mathbf{C}}$ with p-dichlorobenzene (3:0980) forms a const.-boilg. mixt., b.p. 174.0° at 760 mm., contg. about 12 wt. % $\bar{\mathbf{C}}$ (26); $\bar{\mathbf{C}}$ with o-bromotoluene forms a const.-boilg. mixt., b.p. 180.0° at 760 mm., contg. about 18 wt. % $\bar{\mathbf{C}}$ (26).]

Other Physical Data on Binary Systems Contg. C

 $\tilde{\mathbf{C}}$ + aq. [$\tilde{\mathbf{C}}$ is eas. sol. aq.; for study of hydration at -35° see (70) cf. (34); for f.p./compn. data see (3); for data on D_{20}^{20} (31) and D_{25}^{25} (71) of aq. solns. see indic. refs.; for n_D^{18} (8), n_D^{20} (31) cf. (73) see indic. refs.]

 $\bar{C} + H_2SO_4$. [For f p./compn. data and diagram (no compd. formed) see (10).]

 $\bar{C} + H_3PO_3$. [For f p./compn. data and diagram (no compd. formed) see (12).]

 $\tilde{\mathbf{C}}$ + AcOH (1:1010). [For f.p./compn. data (no epd.) (74), D_4^{25} (2), viscosity (2), and conductivity (1) see indic refs.]

 $\ddot{\mathbf{C}}$ + chloroacetic acid (3:1370). [For f.p./compn. data (74), eutectic, m.p. 17.5°, contg. 51.5 mole % $\ddot{\mathbf{C}}$ (75), see indic. refs.]

 \bar{C} + dichloroacetic acid (3:6208). [For f.p./compn. data (74), eutectic, m.p. -11.0°, contg. 36 mole % \bar{C} (75), see indic. refs.]

 $\ddot{\mathbf{C}}$ + miscellaneous cpds. of Order 1. [For f.p./compn. data on following systems see indic. refs.]

 \bar{C} with hydrocarbons: $\bar{C} + C_6 II_6$ (1:7400) (5); \bar{C} + camphene (76).

 \vec{C} with alcohols: \vec{C} + EtOH (1:6130) (14); \vec{C} + ter-BuOH (1:6140) (14); \vec{C} + cetyl alc. (1:5945) (14); \vec{C} + d-borneol (1:5990) (14); \vec{C} + l-menthol (1:5940) (14); \vec{C} + pinacol (1:5805) (14); \vec{C} + meso-erythritol (1:5825) (6); \vec{C} + d-manntol (1:5830) (14).

 \bar{C} with phenols: \bar{C} + phenol (1:1420) (14) (11); \bar{C} + o-cresol (1:1400) (11); \bar{C} + m-cresol (1:1730) (11); \bar{C} + p-cresol (1:1410) (11); \bar{C} + quaiacol (1:1405) (14); \bar{C} + thymol (1:1430) (11); \bar{C} + α -naphthol (1:1500) (11); \bar{C} + β -naphthol (1:1540) (11); \bar{C} + hydroquinone (1:1590) (14)

 \bar{C} with aldehydes: \bar{C} + benzaldehyde (1:0195) (7); \bar{C} + salicylaldehyde (1:0205) (7); \bar{C} + m-hydroxybenzaldehyde (1:0055) (7); \bar{C} + p-hydroxybenzaldehyde (1:0060) (7); \bar{C} + p-anisaldehyde (1:0240) (7); \bar{C} + vanillin (1:0050) (7); \bar{C} + p-peronal (1:0010) (7).

 \bar{C} with ketones: \bar{C} + acetophenone (1:5515) (7); \bar{C} + benzophenone (1.5150) (7); \bar{C} + p-methoxybenzophenone (1:5170) (7); \bar{C} + benzil (1:9015) (7); \bar{C} + dibenzalacetone (1:9024)

(7); \bar{C} + benzoquinone-1,4 (1:9025) (7). \bar{C} with acids: \bar{C} + acetrc acid (1:1010) (74); \bar{C} + benzoic acid (1:0715) (74); \bar{C} + o-toluic acid (1:0690) (74); \bar{C} + m-toluic acid (1:0705) (74); \bar{C} + p-toluic acid (1:0795) (74); \bar{C} + phenylacetic acid (1:0665) (74); \bar{C} + cinnamic acid (1:0735) (74); \bar{C} + crotonic acid (1:0425) (74).

 \bar{C} with esters: \bar{C} + EtOAc (1:3015) (5); \bar{C} + α -naphthyl acetate (1:2124) (5); \bar{C} + β -naphthyl acetate (1:2273) (5); \bar{C} + methyl benzoate (1:3586) (5); \bar{C} + ethyl benzoate (1:3721) (5); \bar{C} + benzyl benzoate (1:4422) (5); \bar{C} + phenyl benzoate (1:2257) (5); \bar{C} + methyl cinnamate (1:2090) (5); \bar{C} + phenyl salicylate ("Salol") (1:1415) (5); various others (5).

 \bar{C} with ethers: \bar{C} + duethyl ether (1:6110) (77); \bar{C} + veratrole (1:7560) (14)

 $\tilde{\mathbf{C}}$ + compounds of Order 2. $\tilde{\mathbf{C}}$ + o-nutrophenol (11); $\tilde{\mathbf{C}}$ + m-nitrophenol (11); $\tilde{\mathbf{C}}$ + p-nitrophenol (11); $\tilde{\mathbf{C}}$ + o-nutrobenzaldehyde (7); $\tilde{\mathbf{C}}$ + m-nitrobenzaldehyde (7); $\tilde{\mathbf{C}}$ + nutrophenol (7); $\tilde{\mathbf{C}}$ + azobenzene (78); $\tilde{\mathbf{C}}$ + ethyl carbamate (urethane) (16); $\tilde{\mathbf{C}}$ + urea (78A).

BIOCHEMICAL ASPECTS OF C

[For study of toxicity of \bar{C} see (79); for study of bactericidal effect see (80) (81).]

PREPARATION OF C

From chloral (anhydrous). [For prepn. of \bar{C} from chloral (3:5210) by oxidn. with fumg. HNO₃ (82) (83) (84), with HNO₂ (85), with NO₂ at 40-60° (70% yield (86)), or with aq. chlorates + cat. see (312); for formn. of \bar{C} from chloral as by prod. of oxidn. with O₂ see (23).]

From chloral hydrate. [For prepn. of \tilde{C} from chloral hydrate (3:1270) by oxidn. with fumg. HNO₃ (63% yield (82)) (85), with KMnO₄ (88), with KClO₃ (89), with Ca(OCl)₂ (15), or with an chlorates + cat. (312) see indic. refs.]

From acetic acid. [For formn. (first discovery) of \bar{C} from acetic acid (1:1010) by chlorination with Cl_2 in sunlight see (90).]

From tetrachloroethylene. [For form. of \bar{C} from tetrachloroethylene (3:5460) by stdg. in aq. in light for 4 months see (91) cf. (92); for many other methods see text of tetrachloroethylene (3:5460) under oxidation.]

From miscellaneous sources. [For form. of \bar{C} from pentachloroethyl chloroformate [Beil. III-13, III_I-(6)] with aq. on htg. (93), but yield is small (94) owing to other modes of reaction (94); from pentachloroethyl trichloroacetate [Beil. II-210] with aq. (95); from trichloroacetyl chloride (3:5420) (96) or from trichloroacetic acid anhydride (3:6575) (97) (98) with aq.; from β,β,β -trichloroethyl alcohol (3:5775) by oxidn. with fumg. HNO₃ (210), see indic. refs.]

CHEMICAL BEHAVIOR OF C

Pyrolysis of C

(See also below under decarboxylation.) Pure $\bar{\bf C}$ shows no tendency to decompose at its b.p. (99). — [However, $\bar{\bf C}$ in presence of pumice begins to decompose about 180° giving (99) HCl, COCl₂ (3:5000), CO + CO₂. — $\bar{\bf C}$ in presence of ThO₂ begins to decompose at 160–165° giving (99) the same products, although $\bar{\bf C}$ in presence of ThO₂ above 210° (100) or in presence of kaolin above 230° (100) gives CHCl₃ (3:5050), tetrachloroethylene (3:5460), hexachloroethane (3:4835), HCl, CO + CO₂. — $\bar{\bf C}$ in presence of animal charcoal at 135° gives (99) CHCl₃ (3:5050) + CO₂, but at 200–300° these are accompanied (100) by a little tetrachloroethylene (3:5460), hexachloroethane (3:4835), HCl, and CO. — $\bar{\bf C}$ at 300° in s.t. for 4 hrs. gives (101) trichloroacetyl chloride (3:5420), CO, CO₂ + HCl.

REDUCTION OF C

[\bar{C} on partial reduction with Zn + aq. (102), with Cu pwdr. in aq. (103), with Cu pwdr. in C₆H₆ + aniline (104) cf. (105), or \bar{C} on electrolytic reduction (106) gives (yields: 80% (103) (106), 75-85% (104)) dichloroacetic acid (3:6208).]

[C on complete reduction with H1 at 100° (87), or in aq. soln. with K/Hg (107) (84), or by electrolytic reduction with Pt, Cu, or Pb electrodes (108) gives acetic acid (1:1010).]

 $[\bar{C} \text{ in aq. alc. KOH with H}_2/Pd \text{ gives up all its chlorine as HCl (109) presumably yielding AcOH (1:1010).]}$

REACTIONS INVOLVING THE —COOH GROUP OF C

Decarboxulation of \bar{C}

 \bar{C} in aq., in aq. alkalies, or in aniline or other organic bases undergoes cleavage into CHCl₃ (3:5050) + CO₂; for this decompn. presence of the trichloroacetate ion appears

necessary since in relatively nonbasic solvents it does not occur [e.g., \bar{C} does not decompose at 25° in C_6H_6 (110), toluene (111), CHCl₃ (110) (111), CCl₄ (110), CS₂ (110), isoamyl alc. (117), acetone (110), ether (110), ethyl acetate (117), ethyl benzoate (110), acetic acid (117), nitrobenzene (110), or 6 N H₂SO₄ (117); in MeOH (111) and in EtOH (111) (112) the only reaction is esterification (see below)].

The decompn. of \bar{C} into CHCl₃ + CO₂ by boiling with aq. or aq. alk. has long been known (90) (113) (114) (115), and KCN behaves similarly (116). — [For studies on kinetics of decompn. of \bar{C} in aq. at various temps. see (4) (118) (119) (103) cf. (120); note that rate of decompn. is catalyzed by light (111) (119) (121) (122). — For studies of decompn. of aq. solns. of various salts (117) (123) (124) (125) and influence of light (126) (127) or of presence of various other inorganic salts (128) see indic. refs. — For studies of decompn. of \bar{C} in aqueous dioxane see (129). — Note that \bar{C} with Ca(OH)₂ on htg. gives CHCl₃ and that this reaction has been patented (134).]

[For study of decompn. of \bar{C} in aniline (117) (111) (130) (131) including influence of supersonic waves (132) see indic. refs.; for decompn. of \bar{C} in tertiary bases such as dimethylaniline see (133) but note in \bar{C} does not decompose in pyridine (111).]

[\overline{C} on htg. in resorcinol or cresol gives (135) CHCl₃ + CO₂, but \overline{C} on htg. in phenol or thymol decomposes differently yielding (135) (136) phosgene (3:5000) + HCl + CO.]

[Note that, as a consequence of the decompn. of \bar{C} into CHCl₃ + CO₂, it has been employed in Reimer-Tiemann types of condensation: e.g., \bar{C} with phenol + aq. NaOH gives o-hydroxybenzaldehyde (1:0205) + p-hydroxybenzaldehyde (1:0060) (137) (138); many other phenols have also been studied (137) (138).]

Acid Strength of C

 \bar{C} in aq. soln. behaves as an exceedingly strong monobasic acid; Neut. Eq. = 163.4 (found 164.6 (91)). — [Ionization constant of \bar{C} in aq. soln. at 25° is about 1.2 (139) cf. (140), but because of strength of \bar{C} and its tendency to decompn. (see above) no accurate value is available (143). — For discussion of resonance and acid strength of \bar{C} see (141) (142) (143). — For studies of electrical conductivity of \bar{C} in aq. solns. at various temps. see (144) (145) (146) (147) (30).]

[Studies of acid strength of \tilde{C} in nonaqueous solvents include the following: in EtOH (148) (149), in n-BuOH (150) (13), in ether (151), in CHCl₃ (151), in formamide (152), in C₆H₆ (153), in chlorobenzene (154), or in dioxane (155). — For study of electrometric titration of \tilde{C} in C₆H₆ (156), in ethylene glycol monomethyl ether ("methylcellosolve") (157), in anisole-n butyl alc. (157), see indic. refs. — For titration of \tilde{C} in Ac₂O soln. with NaOAc see (158) cf. (310). — For study of behavior of \tilde{C} with indicators in C₆H₆ soln. see (159) (160).]

Catalytic Effect of C on Various Reactions

The catalytic influence of \tilde{C} upon diversified types of chem. reactions has been extensively examined; although this matter cannot be recorded exhaustively, the following examples are cited.

[For studies on catalytic effect of \bar{C} upon the inversion of *l*-menthone to *d*-isomenthone in C_6H_6 (161) (162) or in chlorobenzene (163); upon racemization of methyl-phenyl-acetophenone and of isobutyl-phenyl-acetophenone in various solvents (164); of isopulegone to pulegone in nonaqueous solvents (165); or on hydrogen disproportionation of *d*-limonene (311), see indic. refs.]

[For studies of catalytic effect of \bar{C} upon the hydrolysis of EtOAc (144) or of sucrose (166) (167) see indic. refs.]

[For studies of catalytic effect of C upon forms. of ether from EtOH (168); upon rate

of esterification of various org. acids in MeOH (169) or in EtOH (170); upon nitration of toluene (171) cf. (172); upon decompn. of ethyl diazoacetate in C_6H_6 (162) or other solvents (173) (174) (175); upon decompn. of nitramide in 180-AmOH (176); upon rearr. of N-chloroacetanilide (177); upon rearr. of N-bromoacetanilide in chlorobenzene (178) (179) or in other solvents (179); upon rearr. of N-bromobenzanilide in chlorobenzene (180); upon chromate or perchlorate oxidn. of EtOH (181); upon addition of HBr to 3-methylbutene-1 (182), see indic. refs.

Salts of C

This topic cannot here be treated exhaustively but the following examples are cited. Salts with inorganic bases. [NH₄Ā, prepn. (183); NH₄Ā.Ĉ (184) (185); 2NH₄Ā.5H₂O (186) — Hydroxylamine salt, HONH₃Ā, cryst. from dry ether by pptn. with lgr., m.p. 133-134° (187).]

[Li \bar{A} , n_D^{18} of aq. solns. (8), nonhygroscopic cpds. with betaine or pyridine betaine (188); Li \bar{A} .2H₂O (189), conductivity of aq. solns. (190). — Na \bar{A} (198), effect of dry distillation (191), conductivity in aq. (190) (192), in dry MeOH (193), in dry EtOH (194); n_D^{18} of aq. solns. (8); Na \bar{A} .3H₂O (196). — K \bar{A} .H₂O (189) (198), solubility and decompn. (197); K \bar{A} .C (184) (185).

[AgĀ, spar. sol. aq., darkens in air; on dry htg. decomposes above 80° (199) yielding (198) AgCl, CO, CO₂, and trichloroacetic acid anhydride (3:6575); with boilg. aq. AgĀ yields (198) AgCl, CO, CO₂, CHCl₃ (3:5050), and \bar{C} ; for behavior of AgĀ with I₂ in C₆H₆ see (200). — HgĀ, ndls. from aq. in which it is spar. sol. (201) (202) (203) (209) (note that it soluble in C₆H₆ (202)). — HgĀ₂, attempts to prepare this mercuric salt have been unsuccessful (201) (204); aq. solns. of \bar{C} react with HgO long after theoretical amt. has been used (201), and CO, CO₂, and CHCl₃ are also formed (205).]

[Mg $\bar{A}_2.4H_2O$ (189). — Ca $\bar{A}_2.6H_2O$ (196); Ca $\bar{A}_2.3I_2H_2O$, cas. sol. (198). — Sr $\bar{A}_2.6H_2O$ (196). — Ba $\bar{A}_2.6H_2O$ (196); Ba $\bar{A}_2.2H_2O$ (206). — Pe $\bar{A}_2.2H_2O$ (207) (206) — Cd \bar{A}_2 (208); Cd $\bar{A}_2.1I_2H_2O$ (217). — Zn $\bar{A}_2.6H_2O$ (209). — Pb $\bar{A}_2.I_2H_2O$ (210); Pb $\bar{A}_2.H_2O$ (83). — Cu $\bar{A}_2.6H_2O$ (83) (could not be confirmed (201) (211)); Cu $\bar{A}_2.4H_2O$ (211); Cu $\bar{A}_2.3H_2O$ (201) (complexes with benzylamine (212)); Cu $\bar{A}_2.2H_2O$ (complexes with various amines (213)); Cu \bar{A}_2 (201) (complexes with various amines (213)); electrolysis (215), electrometric titration (216).]

[Mn \bar{A}_2 .3½ H₂O (217). — Co \bar{A}_2 .4H₂O (218) (complexes with various amines (218) (219)); Co \bar{A}_2 .3½H₂O (217). — Ni \bar{A}_2 .4H₂O (189) (218) (complexes with NH₃ (211) and various amines (220)).]

Salts with organic bases. [Antline trichloroacetate, from $\bar{\mathbb{C}}$ (1 mole) + aniline (1 mole) in C_6H_6 (223) (224), or without solvent (225), or in aq. (226); this salt has no true m.p. (224) although various values ranging from 145° (226) to 163° (225) have been reported. — Note that, although action of heat would be expected to cause loss of H_2O giving ω,ω,ω -trichloroacetanilide (see below), no actual study has been reported. — Note that $\bar{\mathbb{C}}$ + aniline + Cu powder in C_6H_6 soln. gives dichloroacetic acid (3:6208) (75–85% yield (223) cf. (227)). — Note finally the existence of an acid salt of $\bar{\mathbb{C}}$ with aniline, m.p. 107–108° (224), from $\bar{\mathbb{C}}$ (2 moles) with aniline (1 mole). — o-Toluidine trichloroacetate; the prepn. of this salt, m.p. 167–168° dec. (225), has been claimed (225) but could not be confirmed (224) (228); no other record of it can be found. — p-Toluidine trichloroacetate; the prepn. of this salt, m.p. 135° dec. (225), has been claimed (225) but could not be confirmed (224) (228); no other record of it can be found. — N-Methylandine trichloroacetate: m.p. 97° (228).]

 α -Phenylethylamine trichloroacetate: unreported. — Benzylamine trichloroacetate: from $\ddot{\mathbf{C}}$ + benzylamine in EtOAc, m.p. 118.8-119.8° u.c., 120.3-121.3° cor. (229) (note that this

m.p. is practically identical with corresp. benzylamine salt of chloroacetic acid (3:1370) q.v.). — Piperazine bis-(trichloroacetate), m.p. 121.0-121.5° cor. (230). — Semicarbazide trichloroacetate: m.p. 154° dec. (231).

[Phenylhydrazine trichloroacetate from \bar{C} with phenylhydrazine in C_6H_6 , mp. 123° (232). (Note that this product is definitely the salt since on titration with alk it gives Neut. Eq. 204.7 as against a calcd value of 202 6 (232); this salt upon htg. would be expected to lose H_2O giving trichloroacetophenylhydrazide, but this product is unreported.)]

[For salts of \bar{C} with o-, m-, and p-phenylenediamines see (233).]

Behavior of \bar{C} with Metals

[\bar{C} with aq. + Zn wool (102), or \bar{C} with Cu powder in aq. or C₆H₆ (223) (103) (227), gives dichloroacetic acid (3:6208) q v — \bar{C} in conc. NH₄OH dissolves Cu, Zn, or Cd with strong evoln, of ht. but does not attack Ag (234)]

Esterification of \bar{C}

This book includes the following esters of C under their own individual numbers, q.v.: methyl trichloroacetate (3:5800), ethyl trichloroacetate (3:5950), n-propyl trichloroacetate (3:5975), n-butyl trichloroacetate (3:6315), isobutyl trichloroacetate (3:6140), sec-butyl trichloroacetate (3:9372), ter-butyl trichloroacetate (3:0138), n-amyl trichloroacetate (3:6560), isoamyl trichloroacetate (3:6490), ter-amyl trichloroacetate (3:6510), and β -methoxyethyl trichloroacetate (3:9250).

[For studies on esterification of \bar{C} under various conditions with MeOH (1:6120) (235) (236), with EtOH (1:6130) (235) (237) (238) (239) (240) (241) (242) (243) (244) (20), with n-propyl alc. (1:6150) (245), with isopropyl alc. (1:6135) (245) (246) (238), with n-butyl alc. (1:6180) (247) (248), with isobutyl alc. (1:6165) (247) (248) (83), with sec -butyl alc. (1:6155) (247), with ter-butyl alc. (1:6140) (238), with n-amyl alc. (1:6205) (248), with pentanol-2 (1:6185) (248), with pentanol-3 (1:6175) (248), with ter-amyl alc. (1:6160) (248), with neopentyl alc. (1:5812) (249), with methyl-vinyl-carbinol (250), with benzyl alc. (1:6480) (238) (251), with diphenylcarbinol (1:5960) (238), with triphenylcarbinol (1:5985) (238), see indic. refs [

[For study of equilibrium of transesterification with MeOAc (1:3005) or with EtOAc (1:3015) at 30° see (21).]

Addition Reactions of \bar{C} with Organic Compounds

Addition to unsaturated linkages. \bar{C} in pres. of suitable catalysts adds to unsatd, linkages giving the corresp. esters [e.g., \bar{C} with propylene + BF₃ gives (48.8% yield (246)) isopropyl trichloroacetate (3:5975); \bar{C} with trimethylethylene (2-methylbutene-2) (1:8220) gives both *ter*-amyl trichloroacetate (3:6185) and methyl-isopropyl-carbinyl trichloroacetate (for extensive studies of this reaction see (252) (253) (254) (255) (256) (257) (258) (259) (260))].

[\bar{C} with acetylene + HgSO₄ at 60-80° gives (261) vinyl trichloroacetate [Beil. II₁-(94)], b.p. 149° at 760 mm.]

Addition to epoxy compounds. [\bar{C} with ethylene oxide (1:6105) in cold gives (28% yield (262)) (263) (264) ethylene glycol (mono)trichloroacetate (β -hydroxyethyl trichloroacetate) (3:9099). — For behavior of \bar{C} with 3-chloro-1,2-epoxypropane (epichlorohydrin) (3:5358) see (264).]

Conversion of C to Corresponding Acid Halides

[The corresponding trichloroacetyl fluoride is unreported.]

[\bar{C} with PCl₃ (266) (268) (269), with PCl₃ + ZnCl₂ (25% yield (270)), with SOCl₂ (yield 12% (270), 30% (271)) in C₆H₆ (60% yield (272)) or in pyridine (90% yield (273)), with P₂O₅ + HCl gas (274), with benzotrichloride (3·6540) + ZnCl₂ at 100° (77% yield (275)), or with benzoyl chloride (3:6240) (51-56% yield (276)) gives trichloroacetyl chloride (3:5420). — Note also that \bar{C} on pyrolysis at 300° decomposes (100) with formn. of CO₂ + CO₂ + trichloroacetyl chloride (3:5420) + HCl.]

[\bar{C} with PBr₃ gives (265) (266) trichloroacetyl bromide, b.p. 143° (266), 139.5-140° (265); this product is also obtd. from trichloroacetyl chloride (3:5420) with HBr gas at -5° (70% yield (267)).]

[\bar{C} with PI₃ (266) (or better trichloroacetyl chloride (3:5420) with HI at -5° (277)) gives (71.5% yield (277)) trichloroacetyl todide, b.p. 74 0-74 2° at 30 mm. (277).]

Conversion of \bar{C} to Corresponding Auhydride

[\bar{C} with P₂O₅ at 200–215° (278) (279), or Na \bar{A} with SO₂Cl₂ (or SO₂ + Cl₂) in EtOAc (280), or \bar{C} with trichloroacetyl chloride (3·5420) and PCl₃ (281), P₂O₅ (282), or AlCl₃ (283) gives (yields. 90–95% (280), 80% (278)) trichloroacetic acid anhydride (3:6575).]

- P Color test with NH₄OH/Cu₂Cl₂ reagent. \bar{C} on shaking in filled stoppered bottle with conc. aq. NH₄OH cont₅ Cu₂Cl₂ gives dark blue color instantly (284); note, however, that very similar behavior is shown by dichloroacetic acid (3:6208).
- Methyl trichloroacetate: oil, b p 153° (see 3.5800).
- Ethyl trichloroacetate: oil, b p. 167° (see 3:5950).
- Phenyl trichloroacetate: oil, b.p. 254-255° dec. (135). [From trichloroacetyl chloride (3:5420) with sodium phenolate in pet other (135).] [Note that the isomeric 4-(trichloroacetyl)phenol, m.p. 99-0-99-5° has been prepd. indirectly from trichloroacetonitile ¬- phenol + AlCl₃ (285)]
- --- o-Tolyl trichloroacetate: unreported. [Note, however, that the isomeric 4-(tri-chloroacetyl)-2-methylphenol, mp. 90-91°, has been obtd. indirectly (285).]
- —— m-Tolyl trichloroacetate: unreported. [Note, however, that both the isomers, viz., 4-(trichloroacetyl)-3-methylphenol, mp. 83-87°, and 6-(trichloroacetyl)-3-methylphenol, oil, have been obtd. indirectly (285)]
- p-Tolyl trichloroacetate: mp 68 69° (285) [Obtd only by indirect means (285).] Benzyl trichloroacetate: oil, b p 178 5° at 50 mm (286), 448-149° at 15 mm. (264), $D_4^4 = 1.3887$ (286), $n_5^{18.8} = 1.5288$ (286). [From $\bar{\text{C}}$ with benzyl alc. (1:6480) + HCl gas at 100° (286), or from trichloroacetyl chloride (3:5420) with benzyl alc
- (1.6480)] p-Nitrobenzyl trichloroacetate. mp about 80° cf. (287). [Unsuitable as ① (287).]
- Phenacyl trichloroacetate: unreported.
- --- p-Chlorophenacyl trichloroacetate: unreported.
- --- p-Bromophenacyl trichloroacetate: unreported.
- —— p-Iodophenacyl trichloroacetate: unreported.
- --- p-Phenylphenacyl trichloroacetate: unreported.
- ⑤ S-Benzylthiuronium trichloroacetate: mp 148-149° (288). [Note that for corresp. salts from chloroacetic acid (3:1370) and from dichloroacetic acid (3:6208) m.p. values are respectively 159-160° and 178-179° (288)]
- S-(p-Chlorobenzyl)thiuronium trichloroacetate: m.p. 148° cor. (289). [From C
 (as NaA) with S-(p-chlorobenzyl)thiuronium chloride (289) (m.p. 197°) in alc. (289);
 note that corresp. deriv. of chloroacetic acid (3:1370) has m.p. 158° cor. (289).]

- S-(p-Bromobenzyl)thiuronium trichloroacetate: m.p. 146° cor. (290). [From C (as NaA) with S-(p-bromobenzyl)thiuronium bromide (290) (m.p. 213°) in alc. (290); note that corresp. deriv. of chloroacetic acid (3:1370) has m.p. 154° cor. (290).]
- Φ ω,ω,ω-Trichloroacetamide: m p. 142° (291), 141° (91) (235) (292), 140.5° (293), 137° (294), 136° (300). [From ethyl trichloroacetate (3.5950) with conc. aq. NH₄OH in cold (293) (295) (299) (300), from trichloroacetyl chloride (3.5420) with dry NH₃ gas in C₆H₆ (293), from trichloroacetonitrile with alk H₂O₂ (294), and also from other sources] [For studies on taste of this amide see (296); note also that trichloroacetamide with P₂O₅ on htg gives (85% yield (297)) trichloroacetonitrile, b.p. 83-84° (300).]
- Φ ω,ω,ω-Trichloroacetanilide: m p. 95-97° (302), 94-95° (304), 94° (301) (303) (305).
 [From C by conversion to trichloroacetyl chloride (3:5420) and reaction with aniline directly (301) or in dry ether (83), C₆H₆ (302), or pyridine (303).]
- ω,ω,ω-Trichloroaceto-o-toluidide: m.p. 96° (305). [From ethyl trichloroacetate (3:5950) with o-CH₃.C₆H₄.NH-MgI (305).]
- \mathfrak{D} ω, ω, ω -Trichloroaceto-p-toluidide: m.p. 113° (306). [From $\overline{\mathbf{C}}$ via conversion to trichloroacetyl chloride (3:5420) and reaction with p-toluidine (306).]
- ω,ω,ω-Trichloroacet-N-benzylamide: m p. 92.8-93.6° u.c. (307), 93-6-94 4° cor. (307), 90-91° (308). [From \(\tilde{\Color}\) by conversion to ethyl trichloroacetate (3:3950) and reaction with aq. benzylamine on shaking in cold (307) of (309); note, however, that the corresp. derives from chloroacetic acid (3:1370) have m p's of 93-0-93.6° cor. and 94.8-95.6° cor., respectively (307); also that simple salt of \(\tilde{\Color}\) with benzylamine has m.p. 120-3-121.3° cor. (229).]

3: 1160 2,3,6-TRICHLOROPHENOL OH
$$C_6H_3OCl_3$$
 Beil. VI - 190 VI_1 — VI_2 -(180) M.P. 58° (1) (2) B.P. 252-253° u.c. (5)

55° (4) 248.5-249.5° (6) 53-54° (5) (6)

Ndls. (from alc.) with intense and persistent phenolic odor. - Somewhat sol. in hot aq.; volatile with steam. - Eas. sol. alc., ether, lgr, AcOH; sol. hot C6H6 but ppts. on cooling.

[For prepn. from 2,3,6-trichloro-4-aminophenol via diazo reactn. sec (3).]

 \bar{C} is strongly acidic; ionization const. at 25° is 7.3 \times 10⁻⁷ (2); \bar{C} dissolves in Na₂CO₃ or NaOH (5); \bar{C} can be titrated with N/10 alk.; Neut Eq. = 197.5 (1) (4)

C in AcOH, treated with 1.4 moles Br2, poured into aq. yields 4-bromo-2,3,6-trichlorophenol, ndls. from AcOH, m.p. 80° (3). [The methyl ether of this prod has m p. 69-70°; the benzoate, m.p. 110° (3).]

C treated with 1.5 moles Br2 without solvent yields (3) 4,5-dibromo-2,3,6-trichlorophenol, ndls. from dil. AcOH, m.p. 205° (3). [The methyl ether of this prod. has m.p. 130°; the benzoate, m.p. 153° (3).1

 \bar{C} treated with $(CH_3)_2SO_4 + 20\%$ KOH at 100° for an hour yields its own methyl ether. 2,3,6-trichloroanisole, b.p. 227-229° at 756 mm.; pr. from alc., m.p. 45° (3).

D 2,3,6-Trichlorophenyl benzoate: from \bar{C} + BzCl + 10% KOH; cryst. from pet. ether/lgr., m.p. 92-93° (3); from alc., m.p. 90° (4).

3:1160 (1) Tiessens, Rec. trav. chim. 50, 113-114 (1931). (2) Tiessens, Rec. trav. chim. 48, 1066-1068 (1929). (3) Kohn, Fink, Monatsh. 56, 139-141 (1930). (4) Holleman, Rec. trav. chim. 39, 742-743 (1920). (5) Lampert, J. prakt. Chem. (2) 33, 376-378 (1886). (6) Hirsch, Ber. 13, 1908 (1880).

Cryst. (from pet. eth. (3)). — C mixed with 2,5-dichlorophenol (3:1190), m.p. 57°,

56-57° (2) (3)

depresses m.p. (2). — C is extraordinarily volatile; if dried in vac. this leads to substantial

losses; the volatility and intense odor of \tilde{C} differentiate this dichlorophenol from its isomerides (2). — Odor resembles that of o-chlorophenol and iodoform (3). — \tilde{C} is volatile with steam (3).

[For prepn. from 3-amino-2-chlorophenol via Sandmeyer method see (2) (4); from 2,3-dichloroanline via diazo reaction see (3); from barium 2,3-dichlorophenol-4,6-disulfonate by hydrolysis of sulfonic acid groups with steam (70% yield) see (1).]

[For data on dissociation constant see (5).]

C on direct bromination (1) yields 4,6-dibromo-2,3-dichlorophenol, colorless ndls. (rapidly becoming opaque) from AcOH (1), or colorless feathery ndls. from alc. (4), m.p. 90° (1) (4). [The methyl ether of this product, 4,6-dibromo-2,3-dichloroanisole, long needle-like pr. from alc., has m.p 82° (1).]

 \bar{C} dislyd. in aq. NaOH and shaken with (CH₃)₂SO₄ yields (3) the methyl ether, 2,3-dichloroanisole, m.p. 31° (3).

3:1190 2,5-DICHLOROPHENOL

Cryst with strong and persistent phenolic odor. — Spar. sol. aq., eas. sol. alc., ether, C_6H_6 . — Volatile with steam.

[For prepn. from 2,5-dichloroaniline [Beil. XII-625] via diazo reaction (90% yield (1); 86% yield (6); 70% yield (5)) see (1) (6) (5) (2); from 1,2,4-trichlorobenzene + NaOCH₃ in MeOH at 180° see (7)]

C in dil. alc. reddens blue litmus, dec. on boilg, with Na₂CO₃ Gives only faint color with FeCl₃ (1). [For study of ionization const see (11).]

Č dislyd. in 3 pts. CHCl₃ and shaken with conc. HNO₃ gives on cooling CHCl₃ 80% yield of 2,5-dichloro-4-nitrophenol [Beil. VI-241], colorless ndls. from pet ether, m.p. 117° (8). [Further nitration yields 2,5-dichloro-4,6-dinitrophenol, yel. pr, mp. 146° (8).]—
Č htd. with conc. H₂SO₄ + fumg. H₂SO₄, then nitrated as specified (9), yields 2,5-dichloro-6-nitrophenol, volatile with steam, yel pr. from pet. eth, mp. 70° (9).

 \bar{C} in AcOH treated with 2 moles Br₂, poured into aq., gives (100% yield (6)) 2,5-di-chloro-4,6-dibromophenol, ndls. from dil. AcOH, m.p. 100.5° (6), 99-100° (10). [This dibromo compd. results also from \bar{C} in AcOH + NaOAc + 1 mole Br₂ on htg. at 100° (10).] $[\bar{C}$ with Fe + excess Br₂ gives (100% yield (6)) 2,5-dichloro-3,4,5-tribromophenol, ndls. from AcOH, m.p. 206° (6).]

 \ddot{C} dislyd in KOH and shaken with $(CH_3)_2SO_4$ yields the methyl ether, 2,5-dichloroanisole, b.p. 225-227° u.c. at 752 mm. (6), b.p. 140° at 40 mm. (2), m.p. 24° (5) (2).

② 2,5-Dichlorophenyl benzoate: from C + aq. KOH + BzCl, ndls. from 96% alc.,
m.p. 69° (6).

Colorless tbls. from dil. alc. or lgr. — Vapors of $\bar{\mathbf{C}}$ are very strongly lachrymatory (see also below). — $\bar{\mathbf{C}}$ is insol. aq. but volatile with steam; $\bar{\mathbf{C}}$ is eas sol. alc., ether, or $\mathbf{C_6H_6}$.

[For study of soly. of $\bar{\mathbf{C}}$ in EtOH, C_6H_6 , CCl_4 , or acctophenone over range -23.5° to 53.5° see (19): note that $\bar{\mathbf{C}}$ with C_6H_6 (1·7400) gives (19) a eutectic, m.p. -1.6° , contg. 76 wt. % $\bar{\mathbf{C}}$; $\bar{\mathbf{C}}$ with acetophenone (1:5515) gives a eutectic, m.p. $+5.9^\circ$, contg. 70 wt. % $\bar{\mathbf{C}}$ (19).]

USES OF C

In addn. to its uses as a chem. intermediate, \bar{C} because of its irritant and lachrymatory properties has been much studied as a chemical warfare agent and tear gas under the arbitrary designation "CN."

[For general surveys from this viewpoint see (20) (21). — \bar{C} is sol. in many org. solvents and is frequently loaded into grenades and shells in such solutions of which three common examples are "CNB" (consisting of $\bar{C} + C_6H_6 + CCl_4$), "CND" (consisting of $\bar{C} + Chylene dichloride (3:5130)), and "CNS" (consisting of <math>\bar{C} + Chylene + Chylene$

[For dispensing apparatus for \tilde{C} (29) or for mill for disintegration of \tilde{C} (30) see indic. refs.]

[For m.p. /compn. diagram of system \bar{C} + "Adamsite" (10-chloro-9,10-dihydrophenars-azine), eutectic, m.p. 50°, contg. 90 mole % \bar{C} , see (31).]

[For studies of effect of \bar{C} on skin see (32) (33) (34); for contamination of food by \bar{C} see (35).]

PREPARATION OF C

From chloroacetyl chloride with benzene. [For prepn. of \bar{C} from chloroacetyl chloride (3:5235) with $C_6H_6 + AlCl_3$ (yield 85-88% (15) (64)) (2) (14) (36) (71) see indic. refs.]

From acetophenone. [For prepn. of \bar{C} from acetophenone (1:5515) with Cl_2 in AcOH (4) (18), in CS_2 (85% yield (37)), in lgr. (38) or directly without solvent (yields 65% (6) (37)) (39) see indic. refs.; from acetophenone (1:5515) by electrolysis of its soln. in HCl (40), or by chlorination with aq. N-chlorourea (41), see indic. refs.]

From benzoyl chloride with diazomethane. [For formn. of \bar{C} from benzoyl chloride (3:6240) with diazomethane in ether (72% yield) see (3); note, however, that this procedure has subsequently been much disputed, and for discussion see also (42) (43) (44) (45) (46) (47) (48).]

From miscellaneous sources. [For prepn. of $\bar{\mathbb{C}}$ from N- $(\alpha,\beta$ -dichlorovinyl)diethylamine (yield 92.6% (49)), from chloroacetonitrile (50), or for possible forms. from chloroacetic acid (3:1370) (51), all with C_6H_5MgBr , see indic. refs.; for forms. of $\bar{\mathbb{C}}$ from phenyl copper (52), from phenyldichloroarsine (yields: 58.5% (53), 55% (54)) (55), all with chloroacetyl chloride (3:5235), see indic. refs.; for forms. of $\bar{\mathbb{C}}$ from 1-chloro-2-phenylpropanol-2 (styrene chlorohydrin) (3:9570) by oxidn. with $K_2Cr_2O_7/H_2SO_4$ (1) or from diphenacyltelluride dichloride by oxidn with KMnO₄ (5) see indic. refs; for forms. of $\bar{\mathbb{C}}$ from benzalacetophenone (chalcone) (1:5155) by acts. of Cl_2 in ter-butyl alc. (other prods. are also formed) see (17).]

CHEMICAL BEHAVIOR OF C

REDUCTION

No authentic studies on reduction of C appear to be reported.

OXIDATION

 \tilde{C} on oxidn. with CrO₃ (39), or $K_2Cr_2O_7 + H_2SO_4$ (58) (13) gives benzoic acid (1:0715). — \tilde{C} also reduces NH₄OH/AgNO₃ (13) [perhaps because of some hydrolysis to ω -hydroxy-acetophenone (1:5180)].

HALOGENATION

Chlorination. [\bar{C} on further chlorination under conditions favoring side-chain substitution would be expected to yield ω, ω -dichloroacetophenone (3:6835) and ultimately ω, ω, ω -trichloroacetophenone (3:6874), but no authentic record that this has actually been achieved can be found.]

Bromination. [\bar{C} with Br₂ under suitable conditions gives (56) ω -bromo- ω -chloroaceto-phenone, m.p. 37-37.5°, b.p. 133-134° at 7.5 mm. (56). — \bar{C} in AcOH + NaOAc with Br₂ as directed (57) gives a mixt. consisting of 30% ω , ω -dibromo- ω -chloroacetophenone + 70% ω , ω , ω -tribromoacetophenone.]

Nitration. \bar{C} in conc. H_2SO_4 at -20° treated as directed (9) with a mixt. of fumg. HNO₃ (D=1.50) + conc. H_2SO_4 gives (77% yield (9)) m-nitrophenacyl chloride, m.p. 103° (59), $102-103^\circ$ (16), $100.5-102^\circ$ (9). — [Note that the other two isomeric mononitrophenacyl chlorides, viz., o-nitrophenacyl chloride, m.p. $66-67^\circ$ (60) (61), and p-nitrophenacyl chloride, m.p. 107° (62), are also known, but prepd. indirectly; note also that no dinitration prods. of \bar{C} are known.]

BEHAVIOR OF Č WITH OTHER INORGANIC REACTANTS

With water. [\bar{C} does not readily hydrolyze with aq. but on protracted boilg. (e.g., 20 hrs. (63)) with a large vol. of aq. gives ω -hydroxyacetophenone (1:5180).]

With nitrous acid. \bar{C} with $\bar{H}NO_2$ (from *n*-butyl nitrite + HCl gas) in dry ether gives (yields: 85.6% (64), 82-86% (15)) ω -chloro- ω -isonitrosoacetophenone (phenylglyoxylohydroxamyl chloride) [Beil. X-662, X₁-(315)], white ndls. from CCl₄ (64) or from CCl₄ + C₆H₆ (3:1) (15), m.p. 132-133° (15) (64).

With PCl₅. [\tilde{C} with PCl₅ on distn. gives (65) α,β -dichlorovinylbenzene (α,β -dichlorostyrene) [Beil. V-477, V₂-(367)], b.p. 221°.]

With various salts of inorganic acids. [\bar{C} with KI (66) (67) or better NaI (38) in alc. gives ω -iodoacetophenone (phenacyl iodide) [Beil. VII-286], m.p. 30°; for study of rate of reactn. of \bar{C} with KI in acetone at 0° (11) or with NaI or LiI in acetone at 0° or -10° (10) see indic. refs.]

 \bar{C} does not add NaHSO₃ (37). — \bar{C} in alc. with Na₂S₂O₃ (2 moles) in aq. refluxed 20 hrs. gives sodium phenacylthiosulfate which with HCl gives (73% yield (69)) ω -mercaptoacetophenone (phenacyl mercaptan). — \bar{C} with Na₂S in alc. at 60° gives (70) diphenacyl sulfide [Beil. VIII-94, VIII₁-(541)], m.p. 76.5-77.2° (70), 76° (147); for use of this reactn. in detn. of \bar{C} see (14).

With ammonia. [\bar{C} with NH₃ (1 mole) would be expected to give ω -aminoacetophenone (phenacylamine) [Beil. XIV-49, XIV₁-(368)], but such direct result has never been reported; note, however, that \bar{C} (1 mole) with hexamethylenetetramine (1 mole) in CHCl₃ at room temp. for 12 hrs. gives (60% yield (68)) a 1:1 addn. cpd., m.p. 145°, which upon alcoholysis with conc. HCl in alc. 3 days in cold gives (63-74% yield (68)) phenacylamine hydrochloride.

[Č with alc. NH₃ in s.t. at 100° as directed (2) gives a mixt. contg. diphenacylamine hydrochloride [Beil. XIV-53, XIV₁-(371)], m.p. 235°, together with the hydrochlorides of 2,5-diphenylpyrazine and 2,6-diphenylpyrazine; for discussion of mechanism see (2).]

BEHAVIOR OF C WITH ORGANIC REACTANTS

With Hydrocarbons (+ AlCl₃)

 \tilde{C} with $C_6H_6+AlCl_3$ in s.t. at 100° failed to react (71). — \tilde{C} with toluene (1:7405) + $AlCl_3$ under reflux gives (71) a prod., m.p. 84–85°, which is presumably ω -(p-tolyl)acetophenone [Beil. VII-448], although this prod. obtd. by other methods has different consts.

With Organic Hydroxy (or Mercapto) Compounds

With alcohols. [C with NaOMe might be expected to yield ω-methoxyacetophenone, b.p. 228–230° at 760 mm. (72) (73), b.p. 118–120° at 15 mm. (72) (73), m.p. 7-7.5° (73) (corresp. semicarbazone, m.p. 85° (72), 129° (73) (note disagreement); corresp. 2,4-dinitrophenylhydrazone, m.p. 191–192° (73)); note, however, that no record of this reaction has been reported and the ω-methoxyacetophenone is best prepd. (71–78% yield (74)) from methoxyacetonitrile with C₆H₅MgBr; note also that C with alk. reagts. such as NaOMe reacts in an unexpectedly complex manner yielding (153) cyclic "halogen-diphenacyls."]

[\bar{C} with NaOEt would be expected to yield ω -ethoxyacetophenone [Beil. VIII-90], b.p. 134-136° at 21 mm. (75), 130° at 15 mm. (76), 120-122° at 15 mm. (77), $D_1^{20} = 1.0552$ (77), $D_2^{20} = 1.5250$ (77) (corresp. oxime, m.p. 55° (75); corresp. semicarbazone, m.p. 128° (75)); note, however, that no record of this reactn. has been reported and the ω -ethoxyacetophenone is best prepd. (68% yield (77)) cf. (75) (76) from ethoxyacetonitrile with

C₆H₅MgBr; note also that C with alk. reagts. such as NaOEt reacts in an unexpectedly complex manner yielding (153) cyclic "halogen diphenacyls."

[\bar{C} (1 mole) with ethylene glycol (1:6465) (1 mole) in C_6H_6 contg. trace of benzenesulfonic acid gives on htg (95% yield (81)) the corresp. cyclic ketal, viz., 2-(chloromethyl)-2-phenyl-1,3-dioxolane, mp. 67°, b.p. 144-146° at 15 mm. (81).]

With phenois. [\bar{C} with dry sodium phenolate (78) gives ω -phenoxyacetophenone [Beil. VIII-91], m.p. 74° cor. (79), b.p. 255-257° (78), 187° cor. at 9 mm. (79) (corresp. semi-carbazone, m.p. 187.0-187.5° cor. (79)); note, however, that this prod. is best prepd. (45% yield (79)) from phenoxyacetonitrile with C_6H_5MgBr , or from phenoxyacetyl chloride + C_6H_6 + AlCl₃ cf. (80).]

With mercaptans. [C with *n*-BuSH in alc. NaOH gives (82) phenacyl *n*-butyl sulfide, b.p. 140° at 3 mm., $D_{25}^{25} = 1.0589$, $n_{10}^{20} = 1.5050$.]

[$\bar{\mathbf{C}}$ with sodium p-nitrothiophenate in aq. alc. on htg. gives (98% yield (83)) phenacyl p-nitrophenyl sulfide, yel. pl. from 50–80% AcOH, m.p. 118°. — $\bar{\mathbf{C}}$ (1 mole) with sodium p-thiocresolate (1 mole) in MeOH boiled several hrs. does not give the expected phenacyl p-tolyl sulfide, m.p. 37° cf. (101); distillation of the reaction prod. gives (58 5% yield (84)) phenacyl p-tolyl sulfoxide, b p. 182–184° at 5 mm., m.p. 46° accompanied by acetophenone; note that with $\mathbf{H}_2\mathbf{O}_2$ this sulfoxide oxidizes to phenacyl p-tolyl sulfone, m.p. 110° (see also below).]

Behavior with Carbonyl Compounds

With aromatic aldehydes. [\bar{C} (1 mole) with benzaldehyde (1½ moles) in alc. with alc. NaOEt (1 mole) in cold condenses with loss of HCl giving (80% yield (85)) α -benzoyl- α -phenyl-othylene oxide (benzalacetophenone oxide) [Bul. XVII₁-(196)], colorless cryst. from alc. (85) or from cold acctone by addn. of pct. ether (86), mp. 89-90° (85) (86); note that this prod. can also be obtd. in other ways, notably from benzalacetophenone (chalcone) (1:5155) with Na₂O₂ + HCl in cold (85% yield (86)) or with H₂O₂ in alk. soln. (90% yield (88)) (87) (89); although *cis* and *trans* stereoisomers are possible, only one form is known.]

[\bar{C} with o-nitrobenzaldehyde in alc. NaOEt (although this particular pair has not actually been reported) should yield similarly α -benzoyl- α' -(o-nitrophenyl)ethylene oxide [Beil. XVII₁-(197)] since phenacyl bromide behaves (90) in this fashion; note that for this prod. the two expected geom. stereoisomers are both formed, one with m.p. 175°, the other with m.p. 110°.]

 $[\bar{C}]$ with m-nitrobenzaldehyde ir alc. NaOEt (although this particular pair has not actually been reported) should give similarly α -benzoyl- α' -(m-nitrophenyl)ethylene oxide [Beil. XVII₁-(197)] since phenacyl bromide behaves in this manner (80% yield (91)); one stereoisomer is known, m.p. 118° (91). — Note, however, that \bar{C} (1 mole) with m-nitrobenzaldehyde (1 mole) in AcOH satd. with HCl gas and stood 24 hrs. reacts differently giving (92) m-nitrobenzalacetophenone dichloride [Beil. VII₁-(238)], m.p. 148°,

[$\bar{\mathbb{C}}$ (1 mole) with p-methoxybenzaldehyde (anisaldehyde) (1:0240) (1 mole) in alc. NaOEt gives (93) α -benzoyl- α' -(p-methoxyphenyl)ethylene oxide, m p. 87° (93) (89); also obtd. from p-methoxybenzalacetophenone (1:9011) with alk. H₂O₂ (89).]

[\bar{C} (1 mole) + o-nitrobenzalacetophenone (1 mole) in acetone/diovane with alg. NaOEt (1 mole) gives in 15 min. but yield not stated (93) 1,2-dibenzoyl-3-(o-nitrophenyl)cyclopropane, m.p. 177° (93).]

Behavior of C with Salts of Organic Acids

Č with salts of organic acids gives in general the corresp. phenacyl esters although when the latter are to be prepd. as means of identification of the acids the more reactive phenacyl bromide is usually employed; for m.p.'s of the phenacyl esters of various acids of Order I see Vol. I, p. 650.

[\bar{C} with KCN in dil. alc. on htg. gives (47% yield (94)) ω -cyanoacetophenone (benzoylacetonitrile) [Beil. X-680, X₁-(322)], m.p. 83° (94), 80-81° (95) (96); this prod. may also be prepd. by other means, e.g., from phenacyl bromide with dil. alc. KCN (60% yield (97)), or from ethyl benzoate with acetonitrile + NaOEt (yields: 60% (96), 56% (95)).]

[Č with KSCN in MeOH (98) or EtOH (65) gives ω -thiocyanoacetophenone (phenacyl thiocyanate) [Beil. VIII-94], m.p. 74.1-76.6° cor. (98), 74° (99).]

[\tilde{C} with sodium *p*-toluenesulfinate in boilg, alc. gives (100) cf. (101) phenacyl *p*-tolyl sulfone (ω -(*p*-toluenesulfonyl)acetophenone), m.p. 110° (100) (see also above for formn. of this prod. from \tilde{C} + sodium thio-*p*-cresolate).]

Behavior of \bar{C} with RMgX Compounds

[$\bar{\mathbf{C}}$ (1 mole) with EtMgBr (1 mole) in dry ether gives an addn. prod. which after evapn. of ether, htg. at 130–140°, and hydrolysis gives (yield not stated {102}) benzyl ethyl ketone (1-phenylbutanone-2) [Beil VII-314, VII₁-(167)], b.p. 222–227° (103), 221–223° (102), 110° at 13 mm. (104) (corresp. semicarbazone, m.p. 156–156.5° cor. (105), 150–153° (103), 153° (106), β -form 152°, α -form 146° (104), 146° (102); corresp. 2,4-dimtrophenylhydrazone, m.p. 140–141° (103)); not rearr. in formn of this prod. by this method.]

[Č with n-hexyn-1-yl MgBr in dry ether adds normally and on hydrolysis gives (107) the expected 1-chloro-2-phenylnonyn-3-ol-2.

Behavior of C with Amines

With primary aliphatic amines. [C (1 mole) with MeNII₂ (2.5 moles) in alc. for 5-6 hrs. in cold gives (108) ω -(methylamino)acetopherone [Beil. XIV-50, XIV₁-(369)] (corresp. B.HCl (23% yield (108)), m.p. 219° (108)). — C with n-BuNH₂ similarly gives (35% yield (108)) ω -(n-butylamino)acetopherone hydrochloride, m.p. 214-215° (108).]

[\bar{C} with β -ammoethanol (ethanolamine) readily gives (109) N-(β -hydroxyethyl)phenacylamine, m.p. 144° (109).]

With primary aromatic amines. [C with aniline should yield N-(phenacyl)aniline [Beil. XIV-51, XIV₁-(369)], m.p. 98-99° (110) (corresp. oxime, m.p. 105-106° (111); corresp. semicarbazone, m.p. 171° (110)); however, although the rate of this reaction in abs. alc. at 40° (38) and in 90% alc. at 30.5° (16) cf. (112) has been studied, the usual method of prepn. of N-(phenacyl)aniline is from phenacyl bromide + amline. — Pure N-(phenacyl)aniline, contrary to earlier statements, is remarkably stable and can be exposed to air at room temp. for 18 months or distilled under reduced press. (b.p. 208-210° at 12 mm.) without change (113); for important study of mechanism of conversion of N-(phenacyl)aniline to 2-phenylindole see (113) (114).]

[The behavior of \bar{C} with the three toluidines has not itself been studied but should be similar to that of phenacyl bromide which with o-toluidine gives (115) (116) N-(phenacyl)o-toluidine [Beil. XIV-52, XIV₁-(370)], m.p. 91° (116), 89° (115) (corresp. oxime, m.p. 92° (116)); with m-toluidine gives N-(phenacyl)-m-toluidine, m.p. 110° (117); with p-toluidine gives N-(phenacyl)-p-toluidine [Beil. XIV-52, XIV₁-(370)], m.p. 134° (118), 127° (115) (corresp. oxime in two geom. stereoisomers of m.p. 97° and 92°, resp. (111)).]

With secondary aliphatic amines. [\bar{C} with Me₂NH should yield ω -(dimethylamino)-acetophenone (phenacyl dimethylamine) [Bell. XIV-50], b.p. 126-128° at 18 mm. (119), 122-123° at 14 mm. (120) (corresp. \bar{B} .HCl, m.p. 174° (120), corresp. \bar{B} .HBr, m.p. 184-186° (121), corresp. \bar{B} .PkOH, m.p. 150° (119), 143° (122), 141° (123)); note, however,

that this particular combination of reactants has not actually been reported and that the ω -(dimethylamino)acetophenone is usually obtd. from phenacyl bromide with Me₂NH (119) (121), or from dimethylaminoacet-N,N-dimethylamide with C₆H₅MgBr (80% yield (120) (125)).]

[\bar{C} (1 mole) with Et₂NH (2 moles) in C₆H₆ stood 2 days at room temp. ppts. Et₂NH.HCl and gives (65% yield {125}) ω -(diethylamino)acetophenone, b.p. 148-152° at 30 mm. {125}, $n_{13}^{25} = 1.5180$ (125).]

 $[\bar{C} + bis-(\beta-hydroxyethyl)amine (diethanolamine) in C₆H₆ on long boilg. gives (109) N-phenacyl-N,N-bis-(\beta-hydroxyethyl)amine, m.p. 44° (109).]$

With secondary heterocyclic amines. [Č with piperidine in dry ether splits out HCl and yields (126) ω -(piperidine)acetophenone (N-(phenacyl)piperidine) [Beil. XX-42], b.p. 180-181° cor. at 26 mm. (127), 157° at 15 mm. (128), 163-164° at 13 mm. (126), $D_2^{21.2} = 1.0430$ (126), $n_D^{22.4} = 1.5408$ (126) (corresp. B.HCl, mp 226-227° (129), corresp. B.HBr, m.p. 227-228° (135), corresp. oxime, m.p. 112-115° (130)).]

[Č with morpholine in dry ether ppts. morpholine HCl and yields (131) ω -(morpholino)-acetophenone (N-(phenacyl)morpholine), m.p. 50-52° (132) (corresp. B.HCl, m.p. 222-223° cor. (133), 219-223° (134), 213-214° dec. (131), 212-214° (132); corresp. B.PkOH, m.p. 156-157° (132)).]

[\bar{C} (1 mole) with N'-phenylpiperazine (2 moles) in dry ether at room temp. for several hrs. (136) or \bar{C} (1 mole) with N'-phenylpiperazine (1 mole) + slight excess anhydr. Na₂CO₃ in alc. refluxed ½ hr. (136) gives 80-85% yield N-phenacyl-N'-phenylpiperazine, m.p. 106-108° cor. (136) (corresp. B.HCl, m.p. 210-212° cor.; corresp. oxime, m.p. 157-158° cor. (136)).]

[Note, however, that \bar{C} with 3-carbethoxy-2-methylpyrrole + AlCl₃ in CS₂ does not acylate the nitrogen but gives Friedel-Crafts type reaction yielding (137) 3-carbethoxy-2-methyl-5-phenacylpyrrole, m.p. 205°.]

With tertiary aliphatic amines. [Direct addn. of \ddot{C} to Me₃N appears not to have been reported; the quaternary salt to be expected, viz, phenacyl-trimethyl-ammonium chloride, m.p. 204° dec. (138), 202° (121), has been prepd. indirectly.]

With tertiary aromatic amines. [The quaternary salt, viz., dimethyl-phenyl-phenacyl-ammonium chloride, to be expected from C + dimethylaniline is unreported.]

With tertiary heterocyclic amines. (See also below under O's.)

[\bar{C} (1 mole) with pyridine (1+ moles) in dry C_6H_6 on warming gives (25% yield (139)) phenacyl-pyridinium chloride, mp. 109-110° (139), 113° (140); note that this prod. with aq. 20% NaOH at room temp. undergoes cleavage giving (96% yield (141)) benzoic acid (1:0715) and (30% yield (141)) N-methylpyridone-2 [Beil. XXI-268, XXI₁-(278)], b.p. 127° at 12 mm. (141). — For study of rate of addn. of \bar{C} to pyridine in alc. soln. at 55.6° (142) or in 90% alc. at 30.5° (16) cf. (112) see indic. refs.]

Behavior of C with Arylhydrazines

(See also below under \mathbb{O} 's.) — $\overline{\mathbb{C}}$ with many arylhydrazines does *not* yield the corresp. arylhydrazones because the reaction takes a different course.

Č (2 g.) with phenylhydrazine (1.4 g.) in warm EtOH (20 ml.) contg. NaOAc.3H₂O in aq. (10 ml.) ppts. (14) a yellow solid, m.p. 137° dec. (14), regarded as 1,3-diphenyl-(1,2-diazacyclobutene-2). — Similarly, Č with o-tolylhydrazine gives (14) 1-(o-tolyl)-3-phenyl-(1,2-diazacyclobutene-2), m.p. 147.2° (14); Č with p-tolylhydrazine gives (14) 1-(p-tolyl)-3-phenyl-(1,2-diazacyclobutene-2), m.p. 159.8° dec. (14); Č with p-nitrophenyl-hydrazine gives (14) 1-(p-nitrophenyl)-3-phenyl-(1,2-diazacyclobutene-2), m.p. 173° dec. (14). — [For further discussion of structures of these prods. see also (143).]

Behavior of C with Other Miscellaneous Nitrogeneous Reactants

Č with diazomethane in dry ether + MeOH for 12 hrs. gives (88% yield (144)) 3-chloro-2-phenyl-1.2-epoxypropane (α -chloromethyl- α -phenyl-ethylene oxide), b.p. 135-137° at 17 mm. (144).

- © Chloromethyl phenyl ketoxime: cryst. from CS₂, m.p. 88.5-89° (4), 88-89° (17). [From C (1 mole) + hydroxylamine hydrochloride (3 moles) in dil. MeOH stood overnight, prod. pptd. by addn. of aq. (4); note that this oxime on Beckmann rearr. with PCl₅ gives (4) ω-chloroacetanilide, m.p. 134.5° (5).]
- © Chloromethyl phenyl ketone 2,4-dinitrophenylhydrazone: orange cryst., m.p. 212° cor. (145). [See above for behavior of \tilde{C} with various other arythydrazines.]
- © Chloromethyl phenyl ketone semicarbazone: m.p. 160° on "Maquenne bloc" (1), 156° (146), 149° (147). [From Č (3.1 g.) in alc. (25 ml.) with semicarbazide hydrochloride (2.2 g.) in aq. (12.5 ml.) at 40° on addn. of NaHCO₃ (1.7 g.) in small increments; yield 71% (147); for study of chem. behavior of this prod. see (147).]
- N-(Phenacyl)phthalimide (ω-phthalimidoacetophenone) [Beil. XXI-479]: m.p. 167° u.c. (148), 166° (149). [This prod. has never been reported from C + K phthalimide but has been prepd. indirectly. However, for its prepn. from phenacyl bromide with K phthalimide see (150).]
- N-(Phenacyl)tetrachlorophthalimide (ω -(tetrachlorophthalimido)acetophenone): pl. from CHCl₃ on pouring into MeOH, m.p. 258-259° (151). [From \bar{C} (?) or phenacyl bromide with K tetrachlorophthalimide (151).]
- © Condensation prod. from \tilde{C} with N-methyl- β -(carbohydrazido)pyridinium p-toluenesulfonate: cryst. from EtOH/ether 1:1, m.p. 120° cor. (152). [From \tilde{C} + the quatsalt of nicotinic acid hydrazide with methyl p-toluenesulfonate (152).]

46-47°

46°

(12)

(13)

[See also anhydrous chloral (3:5210) and chloral ethylalcoholate (3:0860)]

The m.p. of \bar{C} is profoundly affected by mode of heating and by pressure (1) (2) but when taken in test tube in ord. m.p. apparatus is claimed to be consistently $59-60^{\circ}$ (2). — [For especially extensive studies on the m p. of \bar{C} see (1) (2) (6) (10)]

 \bar{C} undergoes a transition point at 32° detectable by dilatometric methods (15). Furthermore, \bar{C} on heating dissociates into anhydrous chloral and H_2O ; the temperature at which dissocn. begins is unknown, but dissocn. is complete at 78° (15).

Ordinary, definitely the monohydrate, but other hydrates of chloral (3:5210) have been claimed (6). However, the suggestion (16) that C may exist in two modifications appears to be discredited (6) (10).

[For study of crystal structure of \bar{C} see (18); for density and refractive index of various solns. of \bar{C} in aq., EtOH, or toluene see (12); for study of toxicity of \bar{C} see (19)]

Note that \tilde{C} on htg. does *not* give inflammable vapor (diff. from chloral ethylalcoholate (3:0860).

 \bar{C} is eas. sol. in aq. or alc.; much less sol. in CHCl₃ or toluene. [E.g., 1 pt. aq. dissolves following parts \bar{C} at indic. temps.: at 0°, 2.4; at 5°, 2.9; at 10°, 3.8; at 15°, 4.9; at 20°, 6.6; at 25°, 8.3; at 30°, 10.1; at 35°, 12.1; at 40°, 14.3 pts. \bar{C} (20).] — Aq. solns. of \bar{C} are frequently designated as chloral sirup; for study of stability of such solns. see (21).

CHEMICAL BEHAVIOR OF Č

Important note. The chemistry of chloral hydrate ($\bar{\mathbb{C}}$) on one hand and that of anhydrous chloral (3:5210) on the other is so closely interwoven that the division of material between them in this book is necessarily arbitrary. Most of the definite chemical reactions of chloral hydrate have been associated with the text of anhydrous chloral (3:5210), which should always be consulted. Certain methods for the detection and for determination of chloral and chloral hydrate, however, are brought together here under the latter.

DETERMINATION OF C

For the quantitative detn. of $\tilde{\mathbf{C}}$ several different principles have been employed as further explained below.

By behavior with alkali. This method is based upon the fact that \bar{C} with aq. alkali undergoes hydrolytic cleavage to CHCl₃ (3:5050) and formic acid (1:1005); since the

latter is neutralized 1 equivalent of alkali is used up for each mole of formic acid produced and therefore for each mole of \tilde{C} originally present. Since on the one hand the CHCl₃ produced is readily volatile and since on the other it is itself attacked by the excess alkali, some standardization of conditions is required. The process usually involves use of a known amount (excess) of standard alkali followed by back titration with standard acid.

[For especially valuable summaries and discussion of this method see (22) (23); for additional material on characteristics of this method see (24) (25) (26) (27) (28) (29) (31) (32) (33) (34) (35) (41); for discussion of detn. of the formate produced see (22).]

If the sample contains other substances which independently react with alkali and thus interfere with the above method, \bar{C} may be determined by reduction to acetaldehyde (1:0100) and characterization of the latter. E.g., \bar{C} with Zn + strong HCl (36) (37), or with Zn + dil. H₂SO₄ (37) (38) (27) cf. (42), gives acetaldehyde (1:0100); this may be detd. as p-nitrophenylhydrazone (36) (or otherwise) or if H₂SO₄ was used total chloride ion may be determined (42). This reduction to acetaldehyde is of value in detn. of \bar{C} in presence of CHCl₃ (3:5050) or of α,α,β -trichloro-n-butyraldehyde ("butyrchloral") (3:5910) (38).

By determination of total chlorine as chloride ion. In addition to the reduction methods (mentioned in the preceding paragraph) for conversion of all the chlorine of C to chloride ion, this may also be effected by complete hydrolysis with alkali (usually alcoholic alkali best in pressure bottle (39)) (40) (41); for extensive review of methods based on this principle see (22); the total chloride ion is afterward detd. by conventional methods.

By oxidation methods. By appropriate reagents \bar{C} can be oxidized to trichloroacetic acid (3:1150); by use of a known amount (excess) of standard soln. of oxidant followed by back titration to determine residual oxidant, the amount corresp. to oxidn. of \bar{C} can be detd. For studies of this method using I_2 (22) (42) (34) (43), Br₂ (42), KMnO₄ (42), or (NH₄)₂S₂O₈ (44) see indic. refs.

DETECTION OF C BY VARIOUS COLOR REACTIONS

With various phenols. [For color tests with resorcinol (1:1530) + aq. alk. (45), with pyrogallol (1:1555) + 66% H₂SO₄ (use in distinction from "butyrchloral" (3:5910) (46)), with phloroglucinol (1:1620) + aq. alkali (47) (49) see indic. refs.]

[For behavior of \bar{C} with resorcinol (1:1530) + KBr + conc. H₂SO₄ see (52).]

With pyridine + aq. alk. Since \bar{C} with aq. alk. on warming gives CHCl₃ (3:5050), detection of the latter by means of the pink to red color produced with pyridine in pres. of conc. aq. alkali (Fujiwara reaction) may be used as indirect test for \bar{C} (48) (51). Note, however, that the test is not specific since it is given by various other-trihalogen compounds. [For further information on the Fujiwara reaction see also under trichloroethylene (3:5170).]

With fuchsin-aldehyde reagent. Note that \bar{C} (unlike chloral (3:5210)) does not give color with fuchsin-aldehyde reagent (50).

① 1,1,1-Trichloro-2-methylpropanol-2 ("Chloretone"): M.p. 96°. Convert Č with aq. alk. to CHCl₃ (3:5050) and derivatize the latter by combination with acetone to "chloretone" (3:2662).

Beil. V - 541

V1-(262) V₂-(445) M.P. B.P. 61° 256.5° cor. $n_{\rm D}^{70.7} = 1.60787 (12)$ (20) (1) 60° (2) 256° (2) $(D_4^{20} = 1.178)$ (12) 59.5-60° (3) 255.6° cor. at 752 mm. (10) 58.6-59.8° (4) 264-266° cor. at 751 mm. (13) $(n_D^{20} = 1.631)$ (12) 59° (5) 251-252° (18)58.6° (6) 121-122° at 12 mm. (12) 58.5° 119.6-119.8° at 11 mm. (4) (7) 58-59° (8) 58° (9) 57.4-57.8° (10)56.7° (11) 56.5° (18)56° (12) (13) (14) (21) (27) 55° (15)

[For 1-chloronaphthalene see 3:6878.]

Colorless lfts. from alc.; eas. sol. alc., ether, C₆H₆, CHCl₃, CS₂. — Volatile with steam.

[For prepn. from β -naphthylamine [Beil. XII-1265, XIII₁-(532)] via diazotization and use of Cu₂Cl₂ reaction (yields: 90-95% (17), 82% (15), 75-80% (16)) (3) or even on boilg. diazonium salt soln. with conc. HCl (1) (18), or from diazonium/ZnCl₂ cpd. on addn. to phenol at 60° (44% \bar{C} + 35% hydroxybiphenyl + 13% diphenyl ether (39)), see indic. refs.; from β -naphthol (1:1540) with PCl₅ at 135-140° for 24 hrs. as directed (30% yield (19)) (20) (13) cf. (16) or from trs-(β -naphthyl)phosphoric acid dichloride by htg. at 310° (21) or from sodium β -naphtholate with PCl₃ in toluene (55% yield (22)) see indic. refs.; from sodium β -naphthalenesulfonate with PCl₅ via conv. to β -naphthalenesulfonyl chloride and distn. of latter with a second mole of PCl₅ see (13); from mercury bis-(β -naphthyl) with SOCl₂ see (2); from di- β -naphthyl sulfone with PCl₅ see (23); from β -chloronaphthole acid-1 (3:4845) by decarboxylation in quinoline at 225° in pres. of copper chromite cat. see (8); for formn. of \bar{C} ir small proportion from 1-chloronaphthalene (3:6878) by htg. with AlCl₃ (9) or from naphthalene dichloride by actn. of alkali (24) see indic. refs.]

[For sepn. of \bar{C} from 1-chloronaphthalene (3:6878) by fractional freezing of appropriate solutions see (25).]

[For thermal anal. of systems of \bar{C} with SbCl₃ (14) (26) or SbBr₃ (14) see indic. refs.; with β -naphthol (1:1540), with β -naphthylamine, or with 2-methylnaphthalene (1:7605) see (5), with PkOH see (11).]

[Č with even twice calcd. amt. 5% Na/Hg in alc. for 22 hrs. is not reduced but can be recovered almost quant. (27).]

[Č with Li in dry ether subsequently treated with Me₂SO₄ gives (43% yield (28)) 2-methylnaphthalene (1:7605). — Č with chlorobenzene + Na in xylene refluxed 12 hrs. gives small yield (38) 2-phenylnaphthalene [Beil. V-687], m.p. 101.5° (38).]

[\bar{C} with strong alc. KOH in s.t. at 220° is unchanged (13), but \bar{C} with 5 moles 3-25% aq. NaOH htd. under press. 1 hr. at 350-360° in pres. of Cu gives (29) a mixt. of β -naphthol (1:1540) + α -naphthol (1:1500) cf. (30)]

[Č on mononitration as directed (31) gives 2-chloro-8-nitronaphthalene [Beil. V-556], yel. ndls. from alc., m.p. 116° (31) (of the other theoretically possible mononitro Č isomers only the following are known, and these have been prepd. indirectly: viz, 1-nitro-2-chloronaphthalene, m.p. 99-100° (32), 3-nitro-2-chloronaphthalene, m.p. 105° (33), 4-nitro-2-chloronaphthalene, m.p. 79° (34), 5-nitro-2-chloronaphthalene, m.p. 100.5° (37).]

[C on dinitration with fumg. HNO₃ (17) is claimed to yield 2-chloro-1,6(?)dinitronaphthalene, pale yel. ndls. from alc., m.p. 174° (17); in the pres. of H₂SO₄, however, the same author (17) regards the prod. as 2-chloro-1,8-dinitronaphthalene, pale yel. ndls. from AcOH, m.p. 175° (17), and no later work appears to be recorded as to whether these are the same and if so which.]

[$\bar{\mathbf{C}}$ on trinitration, e.g., by soln. in 8 pts. abs. HNO₃ at 0°, or better (38% yield (15)) by addn. of $\bar{\mathbf{C}}$ (2 g.) to a mixt. of abs. HNO₃ (16 ml.) + conc. H₂SO₄ (8 ml.) at 0°, followed by warming as directed, gives 2-chloro-1,6,8-trinitronaphthalene, pale yel. cryst. from AcOH, m.p. 193°, white ndls. from C₆H₆, m.p. 194° (15).]

[\tilde{C} on cat. oxidn. with air at 250-300° gives (35) 53% phthalic anhydride (1:0725) + 47% 4-chlorophthalic anhydride (3:2725).]

[For chloromethylation of \bar{C} with paraformaldehyde + HCl gas in AcOH see (40).]

- D 2-Chloronaphthalenesulfonamide-8 (7-chloronaphthalenesulfonamide-1): cryst. from dil. alc., m.p. 231-232° u.c. (36). [From \(\bar{C}\) with chlorosulfonic acid as directed, followed by conversion of the intermediate 2-chloronaphthalenesulfonyl chloride-8, m.p. 124-126° u.c., with (NH₄)₂CO₃ to desired sulfonamide (36).]
- --- 2-Chloronaphthalene picrate: m.p. 81.5° (by thermal anal. (11)).

[See also p-chlorocarvacrol (3:0480).]

Note that \tilde{C} is also known as 4-chlorothymol (Beilstein) and as 6-chlorothymol (C.A.) according to differing methods of numbering the thymol nucleus.

PREPARATION OF C

From thymol. [For prepn. of \tilde{C} from thymol (1:1430) by chlorination with Cl_2 in aq. Na_2CO_3 (80% yield (10)), with Cl_2 in AcOH (50% yield (8)), or with SO_2Cl_2 (1) (9) in CHCl₃ (5) see indic. refs.]

From 4-chloro-3-methylphenol (4-chloro-m-cresol). [For prepn. of C from 4-chloro-3-methylphenol (3:1535) by conversion with isopropyl alcohol or isopropyl chloride

(3:7025) (11) or with propylene (3) to 4-chloro-3-methylphenyl isopropyl ether and subsequent rearr. (11) (3), e.g., with H₂SO₄/AcOH (6), to C, see indic. refs.]

From other sources. [For prepn. of C from 4-amino-2-isopropyl-5-methylphenol via diazotization and use of CuCl₂/ZnSO₄ see (4).]

BIOCHEMICAL ASPECTS AND USES OF C

 \bar{C} as a halogenated phenol has been widely considered as an antiseptic, bactericide, disinfectant, germicide, fungicide, etc.; while this aspect cannot here be recorded in detail, the following examples may serve as leading references.

[For general and technical articles on bactericidal (12) (13) (14) (15) (16) (17) (18), fungicidal (12) (19) (20) (21), or anthelmintic (22) action of \bar{C} see indic. refs.; for patents on various means of improving the aqueous solubility of \bar{C} for use as germicide see (23) (24) (25) (26) (27) (28) (2) (29); for patent on use of \bar{C} in mouthwash see (30); for use as disinfectant of a mixt. of \bar{C} (2 pt.) with camphor (1 pt.) (which mixt. is *liquid* above 5°) see (31).]

CHEMICAL BEHAVIOR OF C

Reduction. [\bar{C} in aq. alk. with H_2 + cat. at 180° and 30 atm. (32), or \bar{C} in aq. alk. with Fe filings at 170° or at 200° under pressure (33) gives (100% yield (32)) thymol (1:1430), m.p. 51.5°.]

Oxidation. \bar{C} on oxidation with CrO₃ (8) or with MnO₂ in ice-cold conc. H₂SO₄ (1) gives thymoquinone (1:9003), m p. 45.5°.

Reactions Involving Nuclear Substitution of C

Bromination. [C with Br2 in AcOH gives (8) a mixt. of products]

Nitration. [\bar{C} in lt. pet. floated on an aqueous soln. of nitrous acid (from NaNO₂ + HCl) for a week gave (8) 4-chloro-2-isopropyl-5-methyl-6-nitrophenol [Beil. VI-542, VI₁-(267)], pale yel. ndls. from alc., m.p. 116° (8) (34). — Note that attempts to effect direct nitration of \bar{C} with HNO₃ in AcOH below 20° (8) give a mixt. of products; also that \bar{C} in dry CHCl₃ at — 20° with NO₂ (from htg. dry Pb(NO₃)₂) gives (8) 4-chloro-3,4,6-trinitro-2-isopropyl-5 methyl-cyclohexadien-2,5-one-1 [Beil. VII₁-(100)], yel. cryst., m.p. about 105° dec. (8).]

Mercuration. [For patents on mercuration of \bar{C} see (35) (36).]

Miscellaneous nuclear substitutions. [Note that NaĀ with benzyl chloride (3:8535) in toluene at 110° for 4 hrs. gives (by nuclear benzylation) (37) 4-chloro-6-benzyl-2-iso-propyl-3-methylphenol, b.p. 180° at 3 mm. (37).]

[C with SCl₂ in CS₂ gives (65% yield (5)) a sulfide, C₂₀H₂₄O₂Cl₂S, m.p. 110-111°, of undetermined structure.]

Reactions Involving the Phenolic Group of \bar{C}

(See also below under @'s.)

[\bar{C} with PCl₅ at 180–200° for 2 hrs. gives (9) 2,5-dichloro-p-cymene [Beil. V-423, V₂-(326)], b.p. 240–243°; this prod. on oxidn. with dil. HNO₃ (D=1.15) in s.t. at 180° for 10 hrs. gives (38) 2,5-dichloroterephthalic acid [Beil. IX-847], m.p. 305° (38) (corresp. dimethyl ester, m.p. 136° (38)).]

[For behavior of \bar{C} with POCl₃ giving compds, of types ROPOCl₂ and (RO)₂POCl (R = p-chlorothymyl) see (39); for clinical tests of sodium salt of p-chlorothymylphosphoric acid "thymophogen") with tuberculosis see (40), for prepn. of such salt see (41),

— p-Chlorothymyl methyl ether: oil, b.p. 251° cor. at 760 mm. (1). [From Č with MeI + KOH (1) or from thymyl methyl ether with SO₂Cl₂ (42).]

- --- p-Chlorothymyl ethyl ether: unreported.
- p-Chlorothymyl acetate: oil, b.p. 112-114° at 2 mm. (43). [From C with Ac₂O (9) or AcCl (44); for Fries rearr. to the corresp. acetophenone deriv. see (44) cf. (43).]
- p-Chlorothymyl benzoate: m.p. 71-73° (9). [From C with BzCl in aq. KOH (9).]
- D p-Chlorothymyl benzyl ether: m.p. 55° (7).
- D p-Chlorothymyl o-nitrobenzyl ether: m.p. 117° (7).
- --- p-Chlorothymyl p-nitrobenzyl ether; unreported.
- p-Chlorothymoxyacetic acid: unreported.

3:1300
$$\beta$$
-CHLOROISOCROTONIC ACID $C_4H_5O_2Cl$ $C_4H_5O_$

[See also β-chlorocrotonic acid (3:2625).]

(11) (17)

59.5°

Cryst. from aq. or pet. ether. — \bar{C} is somewhat less sol. in aq. than its stereoisomer (3:2625); e.g., \bar{C} is sol. in 52.4 pts. aq. at 19° (12), in 79 pts. aq. at 7° (11). — \bar{C} is very easily volatile with steam (11) (dif. from β -chlorocrotonic acid (3:2625). — \bar{C} in either cis- α,β -dichloroethylene (3:5028) is very much more sol. than the stereoisomeric β -chlorocrotonic acid (3:2625) (13). — \bar{C} sublimes even at room temp. (11).

For f.p./compn. data and diagram of system \bar{C} + the stereoisomeric β -chlorocrotonic acid (3:2625) (eutectic, m.p. 38.9° contg. 66.8 mole % \bar{C}) see (14).

Preparation. [The most frequently used method of prepn. of \bar{C} is that from ethyl acetoacetate (1:1710) with PCl₅; this treatment leads to the formn. of a mixt. of the acid chlorides of \bar{C} and the stereoisomeric β -chlorocrotonic acid (3:2625) which upon hydrolysis with aq. gives a mixt. of the two acids; from this mixture \bar{C} is removed (together with any unreacted ethyl acetoacetate) by distillation with steam; the yield of mixed acids is variously reported, e.g., 43.7% (3), 36.5% (9); the yield of \bar{C} is relatively small, e.g., 26.8% (3), 13% (1). — The PCl₅ reactn. has often been carried out in dry C_6H_6 (8) (15) (9) (3), but its use is regarded (1) as disadvantageous. — For many important details of procedure see indic. refs.]

[For form. of \bar{C} from α,β,β -trichloro-n-butyric acid (3:0925) by removal of the α - and one β -chlorine atom with Zn see (16); from the stereoisomeric β -chlorocrotonic acid (3:2625) by htg. at 150-160° for 20 hrs. (17) or at 130° in s.t. (18) see indic. refs.]

Chemical behavior. [\bar{C} in alc. or in aq. NaOH with $H_2 + Pd/BasO_4(4)$, or \bar{C} (as NaA) with $2\frac{1}{2}\%$ Na/Hg in aq. (19), yields mainly isocrotonic acid (1:1045) together with some crotonic acid (1:0425) and tetrolic acid, $CH_3-C \equiv C-COOH$; note that \bar{C} is thus dehalogenated more rapidly (4) than the stereoisomeric β -chlorocrotonic acid (3:2625), and that with excess H_2 the products are further reduced to n-butyric acid (1:1035).]

 $\bar{\mathbb{C}}$ on oxidn. with aq. KMnO₄ yields (20) only AcOH (1:1010) and oxalic acid (1:0445). $\bar{\mathbb{C}}$ with Cl₂ in CS₂ soln. adds 1 mole halogen yielding (16) α,β,β -trichloro-n-butyric acid (3:0925), m.p. 52°; $\bar{\mathbb{C}}$ undoubtedly adds 1 Br₂ to yield β -chloro- α,β -dibromo-n-butyric acid but the latter has never been reported.

 \tilde{C} behaves as a monobasic acid; dissociation const. at $25^\circ = 9.47 \times 10^{-5}$ (21). — \tilde{C} on neutralization with cold dil. alk. gives Neut. Eq. 120.5. — Note, however, that with strong aq. KOH \tilde{C} is somewhat more resistant than its stereoisomer (3:2625); e.g., \tilde{C} with 3-4 N KOH at 115-120° (16) cf. (22) gives acetone (1:5400) + K_2CO_3 + KCl; with 7-8% KOH at 125-130° same + some tetrolic acid.

Salts. [NH₄HA.H₂O (11): NaA. $\frac{1}{2}$ H₂O, very sol. aq. or alc. (11): KA.H₂O, sol. in 13.2 pts. alc. at 14° (24): AgA, alm. insol. cold aq.; on htg. with aq. in s.t. at 170° dec. much more readily (24) than its stereoisomer (3:2625) into CO₂ + propadiene (allylene):

 $Mg\bar{A}_2.5H_2O$, $Ca\bar{A}_2.3H_2O$, $Ba\bar{A}_2.2H_2O$, $Zn\bar{A}_2.2J_2'H_2O$, $Mn\bar{A}_2.2H_2O$, $Co\bar{A}_2.6H_2O$, $Ni\bar{A}_2.6H_2O$, all sol. aq. (11): $Pb\bar{A}_2.4H_2O$, spar. sol. aq. (11).]

Č with PCl₅ (25) or with SOCl₂ (26) gives (yield 90% (26)) (29) β -chloroisocrotonyl chloride, b.p. 135–136° at 760 mm.; see also comments under β -chlorocrotonic acid (3:2625).

[\bar{C} (as $K\bar{A}$) with alc. NaOEt on htg. gives after acidification (17) β -ethoxycrotonic acid [Beil. III-371, III₁-(135)], m.p. 137-138° (17), 141° (27); note that during reactn. isomerization has occurred and that this prod. is the same as is similarly obtd. from β -chlorocrotonic acid (3:2625). — \bar{C} (as Na \bar{A}) with Na benzylate on htg. gives after acidification (28) β -benzyloxycrotonic acid, m.p. 121-122° (28), the same as does the stereoisomer. — \bar{C} (as Na \bar{A}) with Na salt of benzyl mercaptan in alc. on htg. gives after acidification (28) β -benzylmercaptoisocrotonic acid, m.p. 130°; note that here isomerization does not occur.]

[For behavior of \tilde{C} (as NH₄ \tilde{A}) with (NH₄)₂SO₃ yielding β -sulfocrotonic acid (3), or of \tilde{C} (as K \tilde{A}) with K₂AsO₃ yielding (10) β -arsonocrotonic acid, see indic. refs.; note that in both cases the products are identical with those obtd. by similar treatment of β -chlorocrotonic acid (3:2625).]

- Methyl β-chloroisocrotonate: b.p. 142°. See 3:8028. [For rate of esterification of C with MeOH see (30).]
- Ethyl β -chloroisocrotonate: b.p. 165°. See 3:8325.
- β-Chloroisocrotonamide: lfts. from aq., m.p. 109-110° (25). [From β-chloroisocrotonyl chloride (see above) with conc. aq. NH₄OH (25).] [For study of solubility in cis-1,2-dichloroethylene (3:5042) and in trans-1,2-dichloroethylene (3:5028) see (13).]
- β-Chloroisocrotonanilide: ndls. from alc., m.p. 106° (25). [From β-chloroisocrotonyl chloride (see above) with aniline + excess cold dil. aq. NaOH in 100% yield (25).]
- β-Chloroisocroton-α-naphthalide: ndls. from alc., m.p. 155° (25). [From β-chloroisocrotonyl chloride (see above) with α-naphthylamine + excess cold dil. aq. NaOH in 100% yield (25).]

MISCELLANEOUS PHYSICAL PROPERTIES OF C

Polymorphism of \bar{C} . \bar{C} is known definitely in the above three α , β , and γ forms and perhaps also in a fourth δ form, m.p. 43.75° (23), although last could not be confirmed (22) cf. (7). — The stable (α) form results from rapid condensation of vapor (23), by crystallization of \bar{C} from aq. soln. (23), or from rapid cooling of fused \bar{C} (37), although last method could not be confirmed (25); it is also obtained from the β form by seeding with α (9) or from γ form by spontaneous transformation (20), or from either β or γ forms at -20° (22).

The β form results from cooling fused \bar{C} especially if melt is first htd. above 67° cf. (9) (23), or from γ form on stirring (23) (20) (37) (22) cf. (25) (7).

The γ form results from fused \bar{C} on cooling without stirring (23) (20) (37) (25) (7).

[For study of transformation points of α and β forms see (21); for studies of effect of pressure on m.p. of \bar{C} see (38) (39) (25) (8).]

Density and refractive index for fused \overline{C} . [Values for these constants are *not* in good accord, viz., $D_A^{65.4} = 1.3978$ (40), $D_A^{65} = 1.3703$ (41); $n_D^{65.4} = 1.4301$ (40), $n_D^{65} = 1.4297$ (41). — For D_A^t over range 80°-176° see (36).]

Vapor characteristics. [For study of vapor pressure of \bar{C} over range 85-180° see (42).—For study of volatility with steam see (43).]

Cryoscopic constant. [Molal f.p. constant for \bar{C} is 5.2° (for 1000 g. \bar{C}) (44) (37); for studies on use of \bar{C} as cryoscopic solvent see (44) (45) (46) (47).]

Association of \bar{C} . [For studies on extent of association of \bar{C} in C_6H_6 soln. at 30° (11), in *p*-chlorotoluene (3:8287) (48), in liquid HF (49), in ether (33), or in water (1-9.7% \bar{C}) (50) see indic. refs.]

Heat of combustion. [For studies on heat of combustion of \bar{C} see (51) (52) (53) (54) cf. (55).]

Exchange reactions. [For study of behavior of \bar{C} with D_2O see (56); with H_2O^{18} see (57).]

Adsorption of \overline{C} by various adsorbents. [For studies on adsorption of \overline{C} from aqueous solns, by various forms of carbon (58) (59) (60) (61) (62) (63) (64), by silica gel (60), by synthetic resins (65), by aniline black (66), by filter paper (67), by hide powder (68), by viscose (69), by $Zr(OH)_2$ (70), or by $Fe(OH)_3$ (71) see indic. refs]

[For studies on adsorption of \bar{C} from nonaqueous solvents by wood charcoal (72) or from aqueous alc. by charcoal (73) or by casein (74) see indic. refs.]

Distribution of \overline{C} between solvents. [For data on distribution of \overline{C} between aq. and ether at 18° (75) or at 25° (76) (77) cf. (81); between aq. and benzene at 25° (78) or at an unstated temp. (79); between aq. and toluene at 25° (78) (80); between aq. and isobutyl alcohol at 25° (80); between aq. and n-amyl alcohol at 25° (80); between aq. and isoamyl alcohol at 25° (80); between aq. and di-n-butyl ether at 25° (5); between aq. and olive oil at 25° and 37.5° (82) see indic. refs.]

[For data on distribution of \bar{C} between aq. and nitrobenzene at 25° (80); between aq. and mixts. of benzene + nitrobenzene (83); between aq. and o-nitrotoluene at 25° (80) (84) see indic. refs.]

[For data on distribution of \bar{C} between aq. and $CHCl_3$ (3:5050) at 25° (80) (85) (86); between aq. and CCl_4 (3:5100) at 25° (80) (87) (85); between aq. and EtBr at 25° (80) (77); between aq. and $CHBr_3$ at 25° (85); between aq. and MeI at 25° (80) (87) see indic. refs.]

[For data on distribution of \bar{C} between aq. and CS_2 at 25° (85); between aq. $MgSO_4$ or K_2SO_1 solns. and di-n-butyl ether at 25° (88) (5); between acetone and glycerol at 25° (89) see indic. refs.]

BINARY SYSTEMS CONTAINING C

Azeotropic systems. [\$\bar{C}\$ with mesitylene (1:7455) forms \$\mathbf{z}\$ const.-boilg. mixt., b.p. 162° at 760 mm., contg. 17 wt. % \$\bar{C}\$ (90); \$\bar{C}\$ with naphthalene (1:7200) forms a const.-boilg. mixt., b.p. 187.1° at 760 mm., contg. 78 wt. % \$\bar{C}\$ (91); \$\bar{C}\$ with o-cresol (1:1400) forms a const.-boilg. mixt., b.p. 187.5° at 760 mm., contg. 54 wt. % \$\bar{C}\$ (91).]

[C with 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) forms a const.-boilg. mixt., b.p. 146.25° at 760 mm., contg. 1.8 wt. % C (91); C with pentachloroethane (3:5880) forms a const.-boilg. mixt, b.p. 158.65° at 760 mm., contg. 9.9 wt. % C (91); C with hexachloroethane (3:4835) forms a const-boilg. mixt., b.p. 171.2° at 760 mm., contg. 25 wt. % C (27); C with 1,2,3-trichloropropane (3:5840) forms a const.-boilg. mixt., b.p. 154.5° at 760 mm., contg. 10 wt. % (92).]

[\bar{C} with p-dichlorobenzene (3:0980) forms a const.-boilg. mixt., b.p. 167.55° at 760 mm., contg. 24.5 wt. % \bar{C} (27); \bar{C} with benzal (dr)chloride (3:6327) forms a const.-boilg. mixt., b.p. 189.1° at 760 mm., contg. 97 wt. % \bar{C} (93).]

[\bar{C} with bromobenzene forms a const.-boilg. mixt., b.p. 154.3° at 760 mm., contg. 11 wt.% \bar{C} (90); \bar{C} with p-dibromobenzene forms a const.-boilg. mixt., b.p. 186.3° at 760 mm., contg. 75 wt. % \bar{C} (93)]

OTHER PHYSICAL DATA ON BINARY SYSTEMS CONTAINING Č

 $\ddot{\mathbf{C}}$ + aq. [$\ddot{\mathbf{C}}$ is very eas. sol. aq. (32); for study of hydration at low temps. see (94); for f.p./compn. data see (23). — Data on density of aq. $\ddot{\mathbf{C}}$ is fragmentary but for D_{20}^{20} (40), D_{25}^{25} (95), and D_{35}^{35} (95) for certain conens see indic. refs. (cf. (96) (97) (98)). — For refractive indices of aq. solns. of $\ddot{\mathbf{C}}$ see (20) (40). — For study of soly. of aq. in $\ddot{\mathbf{C}}$ + $\mathbf{C}_{6}\mathbf{H}_{5}$ see (105).]

 \bar{C} + H_2SO_4 . [For densities, viscosities, and elec. conductivity at 20°, 40°, and 60° over whole compn. range see (12); for f.p./compn. data over range 46–100% \bar{C} (no compound is formed) see (18).]

 $\ddot{\mathbf{C}}$ + acetic acid. (1.1010) [For f p /compn. data and diag., eutectic m.p. -4.0° , contg. 22 mole % $\ddot{\mathbf{C}}$, see (99) cf. (100) (103).]

 $\ddot{\mathbf{C}}$ + dichloroacetic acid (3:6208). [For f p./compn. data (100), eutectic m.p. -10.5° contg. 30.7 mole % $\ddot{\mathbf{C}}$ (101), see indic. refs.]

 $\ddot{\mathbf{C}}$ + trichloroacetic acid (3:1150). [For f.p./compn. data (100), eutectic m.p. 17.5° contg. 48.5 mole % $\ddot{\mathbf{C}}$ (101), see indic. refs.]

 $\ddot{\mathbf{C}}$ + miscellaneous organic compds. of Order 1. [For f.p./compn. data on following systems see indic. refs: $\ddot{C} + C_6H_6$ (1:7400) (103); \ddot{C} + naphthalene (1:7200) (99) (17) (20); \ddot{C} + phenol (1:1420) (17) (16) (102); \ddot{C} + o-cresol (1:1400) (16) (102); \ddot{C} + m-cresol (1:1300) (16); \ddot{C} + p-cresol (1:1410) (16); \ddot{C} + α -naphthol (1:1500) (16); \ddot{C} + β -naphthol (1:1540) (16); \ddot{C} + thymol (1:1430) (16); \ddot{C} + guaracol (1:1405) (16); \ddot{C} + cetyl alc. (1:5945) (99); \ddot{C} + meso-erythritol (1:5825) (14); \ddot{C} + benzoic acid (1:0715) (100); \ddot{C} + o-toluic acid (1:0690) (100); \ddot{C} + m-toluic acid (1:0705) (100); \ddot{C} + p-toluic acid (1:0795) (100); \ddot{C} + phenylacetic acid (1:0665) (100), \ddot{C} + cinnamic acid (1:0735) (100); \ddot{C} + crotonic acid (1:0425) (100); \ddot{C} + dimethyl oxalate (1:0415) (103); \ddot{C} + dimethyl succinate (1:3556) (103); \ddot{C} + methyl cinnamate (1:2090) (103); \ddot{C} + phenyl salicylate ("Salol") (1:1415) (99); \ddot{C} + piperonal (1:0010) (99) (104); \ddot{C} + vanillin (1:0050) (104); \ddot{C} + acetophenone (1:5515) (104); \ddot{C} + benzil (1:9015) (104); \ddot{C} + dibenzalacetone (1:9024) (104).

 $\ddot{\mathbf{C}}$ + miscellaneous compounds of Order 2. [For f.p./compn. data on following system see indic. refs.: $\ddot{\mathbf{C}}$ + urea (19); $\ddot{\mathbf{C}}$ + ethyl carbamate (urethane) (19).]

TERNARY SYSTEMS CONTAINING C

[For f.p./compn. data and diag. of following systems see indic. refs.: \tilde{C} (α -form) + phenol (1:1420) + naphthalene (1:7200) (17); \tilde{C} (β form) + phenol (1:1420) + naphthalene (1:7200) (17).]

USE OF C IN FOODS AND BEVERAGES

General. [For discussion of use of \bar{C} as fermentation and oxidn. inhibitor or stabilizer in fruit juices, carbonated beverages, etc. (sometimes as "Esterex" (106)), see (106) (107) (108) (109) (110); for study of persistence of \bar{C} in such use see (111); for patents on such use see (112); for studies of bactericidal action (113) or fungistatic props. (114) of \bar{C} see indic. refs.]

Toxicity of \overline{C} . [For studies on toxicity of \overline{C} see (115) (116).]

Detection and determination of \overline{C} in foods and beverages. [For studies on detection and detn. of \overline{C} in commercial preservatives (624), in non-alc. beverages (117) (118) or in wines (119) (120) cf. (117) see indic. refs.: for identification of \overline{C} as Ba \overline{A}_2 (optical and crystallographic props.) see (121) (623).]

PREPARATION OF C

From acetic acid. [For prepn. of \overline{C} from acetic acid (1:1010) by chlorination at 250-500° without cat. (625), with Cl_2 in sunlight (32), in light from Hg quartz lamp (122), in silent electric discharge (123), or more usually in presence of catalysts (123) (124) (125) especially sulfur (124) (126) (127) (128) (129), red P (123) (124) (130), iodine (124), mixtures of red P + PCl_5 + I_2 (123) (124) (125) (131) (132) (133) (134), or in acetic anhydride (138) (139) at 100° or in vapor phase over $NiCl_2$ at 350° (140) see indic. refs.]

[For prepn. of \bar{C} from acetic acid (1:1010) by chlorination with SO₂Cl₂ at 115–120° and 4–5 atm. press. (135) or in pres. of a little acetyl chloride (136) or in presence of dibenzoyl peroxide in CCl₄ (70% yield (137)) see indic. refs.; for formn. of \bar{C} from AcOH + HCl on electrolysis see (141).

From trichloroethylene. [For prepn. of \tilde{C} from trichloroethylene (3:5170) with conc. H_2SO_4 at 190–195° see (142) (143) (144) (145) (146); for patents on this process see (147) (148) (149) (150) (151) (152) (153) (154). — Note also that H_2SO_4 may be replaced by arom. sulfonic acids such as benzenesulfonic acid see (155). — Note also that a very similar process (156) starting from unsym.-tetrachloroethane (3:5555) doubtless first involves loss of HCl to trichloroethylene.]

From other chloro-compounds. \bar{C} is also formed by appropriate oxidation of many suitably constituted chloro-compounds [e.g., for formn. of \bar{C} from 1,2-dichloroethane (ethylene (di)chloride) (3:5130) with dry O_2 in u.v. light see (157)].

[For formn. of Č by oxidation of unsaturated chloro-compds. see the following examples: 1,2-dichlorobutene-2, low-boilg. isomer (3:5360), high-boilg. isomer (3:5615) with KMnO₄ in acetone (158); 1,4-dichlorobutene-2 (3:5725) with KMnO₄ or O₃ (159); 1,2,4-trichlorobutene-2 (3:9062) with aq. KMnO₄ (160); 1,4-dichloro-2-methylbutene-2 (3:9204) with O₃ followed by KMnO₄ (161); 4-chlorobutadiene-1,2 (3:7225) with aq. alk. KMnO₄ (162); 1,3-dichlorohexadiene-2,4 (3:9310) with aq. KMnO₄ (163); 3,3,6-trichlorohexadiene-1,4 (3:9308) with aq. KMnO₄ (164); 1,3,4,6-tetrachlorohexadiene-2,4 (3:9306) with aq. KMnO₄ (164); 3,6-dichlorohexatriene-1,3,4 (3:9304) with aq. KMnO₄ (164); 1-chloro-5-methoxypentadiene-2,3 with aq. KMnO₄ (165); ethyl 5-chloropenten-3-oate with aq. KMnO₄ (166); 1-chloro-5-methoxy-5-phenylpentene-2 with KMnO₄ in acetone (35); chloroacetylene (3:7000) with NaOCl (167).]

[For formn. of C from ethylene chlorohydrin (3:5552) by oxidn. with CrO₃ (168); from

1-chloropropanol-2 (propylene α -chlorohydrin) (3:7747) by oxidn. with HNO₃; from 1,3-dichloropropanol-2 (" α -dichlorohydrin") (3:5985) by oxidn. with conc. HNO₃ (169) cf. (170) see indic. refs.]

[For form. of \tilde{C} from chloroacetaldehyde (3:7212) by oxidn. with conc. HNO₃ (171) cf. (172), AgOH (172) or dil. H₂O₂ (173); from chloroacetone (3:5425) by oxidn. with KMnO₄ (161) (174), CrO₃ (174), HNO₃ (174), (175); from 1-chlorobutanone-2 (3:8012) by oxidn. with HNO₃ (176) (177) see indic. refs.]

From aminoacetic acid (glycine). [For formn. of \bar{C} from glycine with nitrous acid (40% yield (178)), with conc. HCl + conc. HNO₃ (179), or from glycine hydrochloride with satd. aq. MgCl₂, CaCl₂, or ZnCl₂ + NaNO₂ (180), see indic. refs.]

From miscellaneous sources. [For prepn. of \tilde{C} from ketene with Cl₂ in gas phase, CCl₄, or dry ether, followed by aq. (181); from ketene with aq. Ca(OCl)₂ (182); from formaldehyde + CO + HCl gas at 180° and 800-900 atm. (183); for formn. of \tilde{C} from atrioxymethylene with SO₂Cl₂ in pres. of ZnCl₂ or AlCl₃ in s.t. at 150° for 12 hrs. (2); from methyl formate (1:1000) with SO₂Cl₂ in s.t. at 165-170° (2); from ethylene with ClO₂ (184); from mtro-trichloromethane ("chlorpicrin") in AcOH on exposure to light (185) cf. (186) (187) (188).]

[For form. of \tilde{C} from α,β -dichlorovinyl ethyl ether (3:5540) on boilg, with excess aq. see (189) (note, however, that with calcd. amt. aq. ethyl chloroacetate (3:5700) results (190)); for formn of \tilde{C} from unsym.-tetrachloroacetone (3:6085) by hydrolytic cleavage with aq. KOH see (191).]

[For formation of \bar{C} from its own derivatives, e.g., chloroacetyl chloride (3:5235), chloroacetic acid anhydride (3:0730), methyl chloroacetate (3:5585), ethyl chloroacetate (3:5700), or other exters, etc., see these compds.]

CHEMICAL BEHAVIOR OF C

Pyrolysis of C

[\bar{C} on distn. through a red-hot tube decomposes giving (192) HCl + CO + CH₂O (1:0145) + sym.-dichlorodimethyl ether (3:5245). — \bar{C} at 250-340° over ThO₂, kaolin, or animal charcoal gives (193) HCl + CO + CO₂, but \bar{C} merely boiled with activated carbon undergoes no decomposition (194).]

[$\ddot{\mathbf{C}}$ on htg. in tertiary bases such as dimethylaniline (195) or pyridine (196) decomposes into CO_2 + MeCl (3:7005), undoubtedly by way of forms. and decomps. of intermediate quaternary ammonium compds. (betaines) (196).]

[\bar{C} in dry ether or C_6H_6 soln. on exposure to ultra-violet light decomposes giving (197) HCl + fumaric acid (1:0895) + a substance which on shaking with aq. yields glycolide (1:0667).]

REDUCTION OF C

[$\tilde{\mathbb{C}}$ on reduction in aq. or aq. alc. alk. with H_2 in pres. of Pd or Ni (198) (199) (200), or $\tilde{\mathbb{C}}$ with chromous sulfate (201), or $\tilde{\mathbb{C}}$ with finely divided Fe (202), or $\tilde{\mathbb{C}}$ in aq. EtOH in ultra-violet light (203), or $\tilde{\mathbb{C}}$ on electrolytic reduction (204) gives acetic acid (1:1010). — Note, however, that attempts to effect bimolecular hydrogenation of $\tilde{\mathbb{C}}$ to succinic acid have been unsuccessful (205).]

OXIDATION OF C

[\overline{C} on oxidn. with $K_2S_2O_8$ gives (206) methylene (di)chloride (3:5020); for study of oxidn. of \overline{C} to CO_2 with $K_2S_2O_8$ see (207). — \overline{C} (as Na \overline{A}) on electrolysis gives (208) cf. (209) methylene (di)chloride (3:5020), chloromethyl chloroacetate [Beil. II-198, II₂-

(193)], and other prods. — For study of photochemical oxidn. of \bar{C} with KMnO₄ in pres. of uranyl salts see (210).]

REACTIONS INVOLVING SUBSTITUTION OF H ATOMS OF ALKYL RADICAL OF C

Fluorination. The behavior of \bar{C} with F_2 appears not to have been studied: chloro-fluoroacetic acid is unknown; chloro-difluoroacetic acid [Beil. II-201] although known has been prepd. from difluoroacetic acid by chlorination.

Chlorination. [Č with Cl₂ (211) in pres. of I₂ (212) gives dichloroacetic acid (3:6208) very likely accompanied by some trichloroacetic acid (3:1150).]

Bromination. [\bar{C} with Br₂ at 160° is claimed (213) to give chloro-bromo-acetic acid [Beil. II-217, II₂-(204)], but this is best prepared by other means, e.g., from α,β -dichloro-vinyl ethyl ether (3:5540) by addn. of Br₂, conversion by distn. to chloro-bromo-acetyl chloride, and hydrolysis (214) (41) (215) (216). — Note that although dibromination of \bar{C} to chloro-dibromo-acetic acid [Beil. II-220] appears unreported, yet this product is obtd. by other means cf. (217)

Sulfonation. [\bar{C} with ClSO₃H on warming (218) or \bar{C} with SO₃ finally at 70° (219) cf. (220) gives sulfo-chloroacetic acid [Beil. III-598, III₁-(208), III₂-(387)], hygroscopic ndls. of monohydrate from aq., m.p. 83° (219) (corresp. bis-acid chloride, oil, b.p. 70° at 3 mm., D_{-}^{15} = 1.669, n_{D}^{23} = 1.4920 (121); corresp. N,N,N',N'-tetraphenyldiamide, m.p. 210° (121)), accompanied (218) (220) by some chloromethanedisulfonic acid (chloromethionic acid) [Beil. II-25]. — For resolution of d,l-sulfochloroacetic acid see (219).]

Miscellaneous substitution reactions. [\bar{C} (as $K\bar{A}$) on boilg, with aq. gives (222) the salt of chloromercuri-chloroacetic acid which with either acid or alk, gives glycolic acid (1:0430).]

REACTIONS INVOLVING THE —COOH GROUP OF C

Acidic Strength of \bar{C}

 $\bar{\mathbf{C}}$ behaves as a very strong monobasic acid; Neut. Eq. = 94.5. — [Ionization const. of $\bar{\mathbf{C}}$ in aq. at 25° is 1.55×10^{-3} (223) (224), 1.51×10^{-3} (224) (225), 1.396×10^{-3} (226), 1.378×10^{-3} (227). — For examples of other studies of ioniz. const. of $\bar{\mathbf{C}}$ in aq. see (228) (229); for study of temp. variation of ioniz. const. in aq. over range 0-40° see (227) (230); for H+ conc. of $\bar{\mathbf{C}}$ in aq. solns. (75), in aq. solns. of KCl or NaCl (231) (234), or in buffer mixts. of $\bar{\mathbf{C}}$ + Na $\bar{\mathbf{A}}$ (232) (233); for studies of elec. conductivity of $\bar{\mathbf{C}}$ in aq. soln. at 0° (235), at 60° (236), at 62.5° (45), or over range 0-78° (4) see indic. refs. — For discussion of resonance and acid strength of $\bar{\mathbf{C}}$ see (237) (238) (239). — For study of "sourness" of $\bar{\mathbf{C}}$ from taste aspect see (252).]

[Studies of acid strength of \bar{C} in other solvents include the following: in EtOH (240) (241), in n-BuOH (242), in 60% methyl "cellosolve" (ethylene glycol monomethyl ether) (243), in m-cresol (242), in ether (244), in formamide (245), in acetonitrile (246), in C_6H_6 (247), in chlorobenzene (248), or in CHCl₃ (244). — For studies on electrometric titration of \bar{C} in C_6H_6 (249), or use of indicators with \bar{C} in C_6H_6 soln. (250), see indic. refs. — For studies of elec. conductivity of \bar{C} in MeOH, EtOH, BuOH, acetone see (251).]

Catalytic Effect of Cupon Various Reactions

The catalytic influence of C upon diversified types of chem. reaction has been extensively examined; although this matter cannot be recorded exhaustively, the following examples are cited.

[For studies of catalytic effect of \bar{C} upon the inversion of *l*-menthone to *d*-isomenthone in C_6H_6 (253) or in chlorobenzene (254); upon racemization of methyl-phenyl-acetophenone

and of isobutyl-phenyl-acetophenone in various solvents (255); upon I_2 /acetone reaction (224) (234) (256) (257) (232); upon hydrogen disproportionation of limonene (622) see indic. refs.]

[For studies of catalytic effect of Č upon the hydrolysis of ethyl formate in neutral salt solns. at 25° (258); of EtOAc (259) (235) in pres. of NaĀ or NaCl (259) (225); of sucrose (260) (261) see indic. refs.]

[For studies of catalytic effect of \bar{C} upon forms. of ether from ethyl alcohol (262); upon depolymerization of paraldehyde (273) or of dimeric dihydroxyacetone (263); upon bromination of ethyl acetoacetate (264) see indic. refs.]

[For studies on catalytic effect of \bar{C} upon nitration of toluene (265) (266); upon decompn. of ethyl diazoacetate in C_6H_6 (253) (267); upon decompn. of nitramide (268); upon rearr. of N-chloroacetanilide in chlorobenzene soln. at 100° (269); upon rearr. of N-bromoacetanilide in chlorobenzene, C_6H_6 , or ethylene (di)chloride (270); upon rearr. of N-iodoformanilide in anisole (271); upon rearr. of N-bromobenzanilide in chlorobenzene at 25° (272) see indic. refs.]

Salts of C

This topic cannot be exhaustively treated here but following examples are cited.

Salts with inorganic bases. [NH₄ \bar{A} , from \bar{C} in abs. alc. with dry NH₃ gas (274). — Hydroxylamine salt, HONH₃ \bar{A} , cryst. from boilg. alc., m.p. 124-125° (275).]

[Na\(\tilde{A}\) on electrolysis gives (208) (209) methylene (di)chloride (3:5020), chloromethyl chloroacetate [Beil. II-198, II₂-(193)], and other prods.; on htg. gives (276) polyglycolid, for rate of decompn. by aq. see (277). — K\(\tilde{A}\), 3H₂O (32); K\(\tilde{A}\).1½H₂O (32) (277) (for study of rate of decompn. by aq. see (277)); K\(\tilde{A}\).\(\tilde{C}\), sparingly sol. aq. (32). — Ag\(\tilde{A}\), spar. sol. cold aq., more readily in hot aq. (32); for soly. in HNO₃ see (278); dry htg. gives (279) AgCl + polyglycolid; on htg. with a little aq. gives (279) AgCl + glycolic acid; for prepn. and study of activity coefficient in pres. of electrolytes see (280); for sensitivity to light see (281).]

[Be \bar{A}_2 , see (293); Mg \bar{A}_2 .2H₂O, very sol. aq. or alc. (277); Ca \bar{A}_2 .H₂O, very sol. aq. or alc. (277) (for use in eel worm control in soil see (282)); Sr \bar{A}_2 , spar. sol. aq. alc. (277); Ba \bar{A}_2 .H₂O (32) (277) (293) (for use in detn. of \bar{C} see (121) (623)); Cu \bar{A}_2 , 4H₂O (274), Cu \bar{A}_2 .3H₂O (283), Cu \bar{A}_2 (274) cf. (284); for study of electrolysis see (285); for dissoc. see (288); for various complexes with NH₃ and amines see (286) (287). — Zn \bar{A}_2 .2(4?)H₂O (274). — Cd \bar{A}_2 .6H₂O, for prepn. (289), crystallography (290), dissociation (288), and conductivity (291) see indic. refs. — Pb \bar{A}_2 , spar. sol. cold aq. (274). — Hg \bar{A}_2 , spar. sol. aq. (292). — Hg $_2\bar{A}_2$, spar. sol. aq. (292).]

[Al \bar{A}_3 , see (293). — Mn \bar{A}_2 . \bar{C} .H₂O (274); Mn \bar{A}_2 . \bar{C} .2H₂O (274); Mn \bar{A}_2 .1.5H₂O (289). — Co \bar{A}_2 .6H₂O, m.p. 68-69° (289), for study of complexes with pyridine see (294). — Ni \bar{A}_2 , 3H₂O (274), for complexes with various amines see (295). — For studies on complexes of \bar{C} with iron salts see (274) (296) (297).]

Salts with organic bases (amines). [Aniline chloroacetate, m.p. 88° (298) (best from \bar{C} in dry ether treated dropwise with aniline in dry ether with cooling (299); note that this salt with P_2O_5 on stdg. gives (299) ω -chloroacetanilide, m.p. 136° cor.). — o-Toluidine chloroacetate, m.p. 95° (300). — p-Toluidine chloroacetate, m.p. 97.5° (300) (note that this salt at 80-90° for 2 hrs. (301) or with P_2O_5 (302) gives chloroaceto-p-toluidide, m.p. 164° (302)).]

α-Phenylethylamine chloroacetate, from Č + base in EtOAc, m.p. 93.6-94.4° u.c., 94.7-95.5° cor. (303). — Benzylamine chloracetate, from Č + base in EtOAc, m.p. 118.4-119.4° u.c., 119.9-120.9° cor. (303) (note that this m.p. is practically identical with corresp. benzylamine salt of trichloroacetic acid (3:1150) q.v.). — Piperazine bis-(chloroacetate), m.p. 145-146° cor. (304). — Semicarbazide chloroacetate, m.p. 111-112° (305).

Phenylhydrazine chloroacetate, from \bar{C} with phenylhydrazine in C_6H_6 , m.p. 111° (306) (note that this product is definitely the salt since on titration with alk. it gives Neut. Eq. 204.7 as against calcd. value of 202.6 (306); however, during detn. of m.p. it is undoubtedly converted to chloroaceto-phenylhydrazide, m.p. 115° (307), directly obtd. from chloroacetyl chloride (3:5235) with phenylhydrazine in ether (307)).

Behavior of Acidic Hydrogen of C with Metals

[For study of rate of soln. of Mg in aq. solns. of \tilde{C} see (308); for behavior of \tilde{C} with Zn see (309); for study of 20% aq. solns. of \tilde{C} on silver see (310).]

Esterification of C

This book includes the following esters of \bar{C} under their own individual numbers q.v.: methyl chloroacetate (3:5585), ethyl chloroacetate (3:5700), n-propyl chloroacetate (3:0565), isopropyl chloroacetate (3:8160), n-butyl chloroacetate (3:8330), isobutyl chloroacetate (3:8375) sec-butyl chloroacetate (3:8350), ter-butyl chloroacetate (3:8220), ethylene glycol (mono)-chloroacetate (3:6780), ethylene glycol bis-(chloroacetate) (3:0720), β -methoxyethyl chloroacetate (3:9285), diethylene glycol (mono)chloroacetate (3:9390), triethylene glycol (mono)-chloroacetate (3:9588), and phenyl chloroacetate (3:0565).

[For studies of rate of esterification of \bar{C} under various conditions with MeOH (1:6120) (311) (312) (313) (314) (315), with EtOH (1:6130) (312) (313) (1) (316) (317) (318), with isobutyl alc. (1:6165) (319) (320), with amyl alc. (313), or with neopentyl alc. (1:5812) (321) see indic. refs. — For studies on esterification of \bar{C} with alcohols by BF₃ method (312) (322) or without cat. (328) see indic. refs.]

[For patents involving esterification of \bar{C} with alcs. (323) by use of Cl_2 (324) see indic. refs.]

[For study of use of \bar{C} in esterification of various carbohydrate derivs. (325) or of cellulose (326) cf. (327). — Note that the chemistry of poly (vinyl chloroacetate) cannot be considered here.]

Addition Reactions of C with Organic Compounds

Addition to unsaturated linkages. \bar{C} in presence of suitable cat. adds to unsaturated linkages giving the corresp. esters [e.g., \bar{C} with propylene + BF₃ at 60-70° gives (34.2% yield (329)) isopropyl chloroacetate (3:8160); \bar{C} with butene-2 + ZnCl₂ at 100° for 8 hrs. gives (330) sec-butyl chloroacetate (3:8350); similarly \bar{C} with pentene-2 (1:8215) gives (330) diethylcarbinyl chloroacetate, b.p. 177-178°. — Note, however, that no record can be found of reaction of \bar{C} with ethylene to give ethyl chloroacetate (3:5700)].

[Č with *n*-butylacetylene (hexyne-1) (1:8055) in pres. of HgO + MeOH + BF₃.Et₂O gives (68% yield (331)) 2-(chloroacetoxy)hexene-1, b.p. 100-101° at 20 mm., $D_{-}^{26} = 1.017$, $n_{-}^{25} = 1.4453$ (331). (For addition of Br₂ to this prod. giving 67% yield 1-bromohexanone-2 + 21% yield chloroacetyl bromide see (334)).]

Addition to epoxy compounds. [Č with ethylene oxide (1:6105) in dry ether at 0° for 4 days (332) or at 50° under press. for 6 days (333) gives ethylene glycol mono (chloroacetate) (3:6780).]

Conversion of C to Corresponding Acyl Halides

Conversion of \bar{C} to chloroacetyl fluoride. [\bar{C} on distn. with fluorosulfonic acid (335) or \bar{C} with KF + benzoyl chloride (3:6240) (336) gives (yields: 30% (336), 15% (335)) chloroacetyl fluoride, b.p. 74° (335), 74-76° (336).]

Conversion of C to chloroacetyl chloride. [C can by numerous methods be converted

to chloroacetyl chloride (3:5235) q.v. — Note also, however, that \bar{C} with large excess PCl_5 (4 moles) gives (337) tetrachloroethylene (3:5460) and other products.]

Conversion of \overline{C} to chloroacetyl bromide. [\overline{C} with Br₂ + red P (338) (339) or with PBr₃ (340) gives chloroacetyl bromide, b.p. 127° (338) (340), D_{-}^{0} = 1.840 (340).]

Conversion of C to Corresponding Anhydride

C can by numerous methods be converted to chloroacetic acid anhydride (3:0730) q.v.

REACTIONS INVOLVING THE CHLORINE ATOM OF C

Reduction of \bar{C}

See above as second heading under chemical behavior of \bar{C} .

Hydrolysis of \bar{C} (or its salts)

Hydrolysis of C to glycolic (hydroxyacetic) acid (1:0430) together with the formaunder certain conditions of diglycolic acid (1:0495) has been very extensively studied.

Hydrolysis of \overline{C} (or its salts) with aq. \overline{C} on protracted boilg, with aq. (341) (342) (343) or \overline{C} (as Na \overline{A} or K \overline{A}) on boiling with aq. (32) (344) (277) or C with aq. BaCO₃ (followed by pptn. of barium with H₂SO₄ (345)) gives (88.7% yield (345)) glycolic acid (1:0430).

[For studies on rate of hydrolysis of \bar{C} by aq. under various conditions (626) (342) (343) (346) (347) (348) (359) (351); for study of influence of ultra-violet light (352) (353) (354) (355); for influence of temperature (356); for study of ord. and in heavy aq. (357); for heat of hydrolysis with aq. (358); for study of abnormalities of hydrolysis of salts (359); for study of induction period of hydrolysis (360) (383); for acceleration of hydrolysis by colloidal Ag, Ag₂O, or CuO (349) see indic. refs.]

[For studies of quantum yields of hydrolysis of \bar{C} and use as standard see (361) (362) (363) (364) (365) (366) (367) (353).]

Hydrolysis of \overline{C} (or its salts) with alkalies. \overline{C} on hydrolysis with aq. alkalies also gives glycolic acid (1:0430) [for studies of this reaction see (368) (342) (346) (369) (370) (350) (371) (351) (372) (373); for studies of hydrol. of Na \overline{A} by salts of weak acids (374), for study of basic catalysts (375), for effect of high press. (376) see indic. refs.]

[For patents on conversion of \bar{C} to glycolic acid (1:0430) by alkaline hydrolysis see (377) (378); note, however, that the glycolic acid so formed may be converted (379) to glycolid (1:0667).]

Note also that under the influence of the alkaline medium some of the glycolic acid first formed may condense with unreacted \bar{C} to give diglycolic acid (1:0495): for studies of this aspect of the reaction see (380) (381) (382).

Behavior of C with NaSH or Its Relatives

[\bar{C} with aq. 15% KSH (384) or with freshly prepd. aq. 15% NaSH (385) at 95° for 1 hr., subsequently acidified with H₂SO₄ and extracted with ether, gives (99% yield (385)) mercaptoacetic acid (thioglycolic acid) [Beil. III-244, III₁-(95), III₂-(175)], b.p. 107-108° at 16 mm. (384) (385), m.p. = -16.5° (384), $D_{20}^{20} = 1.3253$ (384). — Note that this prod. is also preparable by many other methods some of which are cited below.]

[\bar{C} (2 moles) as Na \bar{A} with NaSH as directed (386) (387) (388), or as K \bar{A} with KSH (389) (390), or as Na \bar{A} with potassium sulfantimonite (391) or sodium sulfostannate (391), or as Ca \bar{A}_2 with excess Ca(SH)₂ + H₂S (381) gives (84% yield (387)) thiodiglycolic acid (thiodiacetic acid), S(CH₂COOH)₂ [Beil. III-253, III₁-(97), III₂-(178)], cryst. from AcOEt/C₆H₆ (1:9) (388) m.p. 130° (388), 129° (387) (386).]

[Č (2 moles) as NaĀ with aq. Na₂S₂ (392) (393) (394), with alk. or alk.-earth polysulfides (402), with sodium sulfantimonate Na₃SbS₄ (391) or sodium sulfarsenate Na₃AsS₄ (391) gives dithiodiglycolic acid, HOOC.CH₂—S—S—CH₂COOH [Beil. III-254, III₁-(97), III₂-(179)], lfts. from AcOEt/C₆H₆ (1:9) (388) 108-109° (391), 106° (388). — Note that this prod. on reduction gives mercaptoacetic acid (above): e.g., for reduction with Sn + HCl (395), with Zn + H₂SO₄ (393) (396) (401) (402), with Na/Hg (397), by electrolytic reduction in H₂SO₄ soln. using Pb electrodes (398), by shaking soln. of sodium salt with Fe powder at 38° under N₂ (399), or by shaking with alanine or phenylalanine in 1% soln. in pres. of active carbon at 38° under N₂ (400) see indic. refs.]

Behavior of C with Various Salts of Inorganic Acids

(For behavior with NaCN, etc., see further below.)

With halides. [\bar{C} with HBr.5H₂O in s.t. at 150° gives (403) bromoacetic acid [Beil. II-213, II₁-(95), II₂-(201)], m.p. 49-50°, b p. 208°; however, \bar{C} in aq. KBr at 50° shows only very slight tendency to form. of bromoacetic acid (for study of equilibrium see (404)).]

[\bar{C} with aq. KI at 50° (405) (406), or \bar{C} with NaI in acctone at room temp. (407) (or in ethyl methyl ketone, diethyl ketone, or AcOEt (407) but not in EtOH (408)) gives iodoacetic acid, cryst. from much pet. ether (405) (409), m.p. 83° (405), 82° (406); for study of equilibrium of \bar{C} with KI in aq. at 50° see (404); of \bar{C} with KI or NaI in acctone (ionic reaction) see (410).]

With salts of inorganic sulfur, nitrogen, or phosphorus acids. [\bar{C} with aq. Na₂SO₃ gives (41) (412) salts of sulfoacetic acid [Beil. IV-21, IV₁-(312), IV₂-(531)]; for study of rate of reaction of K \bar{A} with Na₂SO₃, K₂SO₃, or (NH₄)₂SO₃ under various conditions see (214) (413).]

[The salts of \bar{C} with aq. Na₂S₂O₃ give the corresp. salts of "glycolic acid thiosulfate" (carboxymethyl hydrogen sulfate) [Beil. III-235, III₁-(97), III₂-(171)]; for studies of this reaction see (414) (415) (416) (417) (418).]

The alkali salts of \bar{C} with aq. alkali nitrites give the corresp. alkali salts of nitroacetic acid; in fact from a conc. aq. soln. of the potassium nitroacetate, treatment with the calcd. amt. of conc. HCl and extraction with much ether gives (70% yield (419)) (420) free nitroacetic acid [Beil. II-225, II₁-(99), II₂-(207)], m.p. 87-89° dec. (420). — However, even aq. solns. of the alkali salts of nitroacetic acid on warming readily lose CO_2 yielding nitromethane [Beil. I-74, I₁-(19), I₂-(40)], b.p. 100.80-100.86° at 760 mm. (421), f.p. -29.2°, $D_4^{25} = 1.1322$ (421), $n_D^{22} = 1.38056$ (421), and although this product is now commercially available from other sources, the reaction is of considerable interest in connection with \bar{C} . — [For studies on the prepn. of nitromethane from $K\bar{A} + KNO_2$ (yield 47% (422)) (423) (424) or from $Na\bar{A} + NaNO_2$ (yields: 70% (428), 58% (426), 53% (429) (430) (431), 35-38% (425)) see indic. refs. — For studies on rate of decompn. of nitroacetic acid in aq. soln. at 20° (432), in HCl, or in acetate buffered solns. at 17.84° and 9.78° (433) cf. (434) (435) (436) see indic. refs.]

[The behavior of \bar{C} with NaN₃ appears to be unreported; note, however, that ethyl chloroacetate (3:5700) with NaN₃ gives (437) ethyl azidoacetate [Beil. II-229, II₁-(101), II₂-(208)], which upon hydrolysis with aq. KOH gives (437) azidoacetic acid.]

[For behavior of C with aq. Na₃PO₄ at 85° see (438).]

Behavior of C with Hydrocarbons

Č with certain aromatic hydrocarbons or their halogen derivs. at elevated temp. but without cat. condenses with elimination of HCl to give arylated acetic acids [e.g., Č with

naphthalene (1:7200) at $180-185^{\circ}$ for 48 hrs. gives (439) α -naphthylacetic acid (1:0728); \bar{C} with 1-chloronaphthalene (3:6878) in generally similar fashion gives (439) 1-chloronaphthalene-?-acetic acid, m.p. 124° : for generally analogous behavior of \bar{C} with acenaphthene, anthracene, fluorene, and even certain phenols and amines see (439).]

Behavior of Chlorine Atom of C with Organic OH and SH Reactants

With alkoxides. \bar{C} with excess alkali alkoxides condenses with elimination of alkali chloride to give the corresponding alkoxyacetic acids [e.g., \bar{C} with MeOH/NaOMe (440) (441) or probably also MeOH/Ba(OMe)₂ cf. (442) gives methoxyacetic acid (1:1065); \bar{C} with abs. EtOH/NaOEt (2 moles) gives (yields: 93% (441), 90% (443), 74% (444)) ethoxyacetic acid (1:1070); \bar{C} with NaO-n-Pr in n-PrOH gives (64% yield (445)) n-propoxyacetic acid [Beil. III-233, III₁-(90), III₂-(170)], b.p. 123° at 26 mm. (446), 108° at 10 mm. (445), $D_4^{20} = 1.0518$ (446), $n_D^{22} = 1.42249$ (446); \bar{C} with NaO-n-Bu gives (84% yield (445)) (447) n-butoxyacetic acid [Beil. III₁-(90), III₂-(170)], b.p. 115-116° at 10 mm. (445), 113-114° at 9-10 mm. (447), $D_4^{20} = 1.0243$ (447), $n_D^{20} = 1.42634$ (447); \bar{C} with Na isobutylate gives (441) isobutoxyacetic acid [Beil. III-233, III₁-(90)], b.p. 118° at 18 mm. (441), 114° at 9 mm. (447), $D_4^{20} = 1.0074$ (447), $n_D^{20} = 1.42004$ (445); for analogous behavior of \bar{C} with sodium derivs. of n-amyl alc. (1:6255) (445), n-hexyl alc. (1:6230) (445), n-heptyl alc. (1:6240) (445) (448), n-octyl alc. (1:6255) (445), n-hexyl alc. (1:6245) (448) cf. (449), geraniol (1:6270) (448), 1-menthol (1:5940) giving (yields: 78-84% (450), 78% (451), 75% (452)) 1-menthoxyacetic acid [Beil. VI₁-(25)], m.p. 53-54° (452); benzyl alc. (1:6480) giving (75% yield (453)) (448) benzyloxyacetic acid; etc., see indic. refs.]

With alkali salts of mercaptans. C with alkali salts of mercaptans should give the corresp, alkylthioacetic acids, but for the most part these have been prepd, by alkylation of mercaptoacetic (thioglycolic acid). - [C (as NaA) with NaSMe should give methylmercaptoacetic acid [Beil. III₂-(177)], b.p. 130-131° at 27 mm. (454), 122-123° at 20 mm. (455), $D_{20}^{20} = 1.223$ (454), $n_{\rm D}^{20} = 1.495$ (454), but this prepr. has not been reported, the product having generally been obtd. (454) (455) from sodium thioglycolate by methylation]. — C (as NaA) with NaSEt in conc. aq. soln. followed by acidification gives (456) ethylmercaptoacetic acid [Beil. III-248, III₁-(95)], b.p. 117-118° at 11 mm. (456), 118-119° at 10 mm. (455), m.p. -8.7° (456), $D_4^{20} = 1.1497$ (456). — Note that n-propylmercaptoacetic acid, b.p. $136.5-137^{\circ}$ at 18 mm. (455), 132° at 15 mm. (454), $D_{20}^{20} = 1.109$ (454), $n_{D}^{20} = 1.109$ 1.483 (454), and isopropylmercaptoacetic acid, b.p. 128° at 13 mm. (454), 124-125° at 9 mm. (455), have been reported only by alkylation of thioglycolic acid. — However, C (as NaA) with Na-S-n-C₄H₉ in aq. soln. gives (yields: 90% (457), 87% (458)) n-butylmercaptoacetic acid, b.p. 144-145° at 14 mm. (455) (corresp. p-bromophenacyl ester, m.p. 95° (458)); for constants on the isomeric isobutyl (455) (459), sec.-butyl (455), and terbutyl (460) mercaptoacetic acids prepd. by other means see indic. refs. — C (as NaA) with NaS-n-C7H15 gives (461) n-heptylmercaptoacetic acid.]

With phenols. \bar{C} (as Na \bar{A}) with salts of phenols, or often \bar{C} with phenols in aq. alk. soln., reacts to give the corresp. aryloxyacetic acids; this procedure comprises a valuable tool for derivatization in the identification (462) of phenols. Although the products of reaction of \bar{C} with all possible phenols cannot be recorded here, attention is directed to the 44 aryloxyacetic acids derived from phenols of Order 1 comprising the summary on page 641 of the "Tables of Order 1" (464), and to analogous aryl oxyacetic acids occurring in this present book as follows: o-chlorophenoxyacetic acid (3:4260); m-chlorophenoxyacetic acid (3:3325); p-chlorophenoxyacetic acid (3:4375); 2,4-dichlorophenoxyacetic acid (3:4095); 2,4,5-trichlorophenoxyacetic acid (3:4335). Many other individual cases which cannot be mentioned here may be found by the usual search methods.

Behavior of C with Salts of Organic Acids

With NaCN, KCN, etc. [\bar{C} on conversion to Na \bar{A} and reaction with aq. NaCN (465) (466) (475) (476) or KCN (467) (468) (469) gives (yields: 75% (469), 70% (468)) cyanoacetic acid (malonic acid mononitrile) [Beil. II-583, II₁-(253), II₂-(530)], m.p. 69-70° (468), 69° (470), 66.1-66.4° cor. (467), 65-66° (471), 65° (472) (473); for use of this reaction in prepn. of malonic acid (1:0480) see (476).]

Note, however, that the behavior of \bar{C} or its salts with KSCN, NH₄SeN, alkali xanthates, etc., is both complex and disputed and cannot be detailed here.

Behavior of C with NH3

 $\tilde{\mathbf{C}}$ with NH₃ under various conditions gives aminoacetic acid (glycine) [Beil. IV-333, IV₁-(462), IV₂-(771)].

[For behavior of \bar{C} with conc. aq. NH₄OH as method of prepn. of glycine (yields: 66-69% (477), 64-65% (478), 54% (479), 50% (480)) (481) (482) (486) (for numerous older refs. see Beilstein) see indic. refs.: for extensive studies on influence of conditions on this reaction see (483) (477); for study of rate of ammonolysis of \bar{C} see (484) (485). — For behavior of \bar{C} with liq. NH₃ see (487), note that \bar{C} in liq. NH₃ with Na splits out calcd. amt. NaCl and that no cyanide is formed (488). — For behavior of \bar{C} with (NH₄)₂CO₃ see (483) (477) (489).]

[Note that reaction of \bar{C} with NH₃ does not stop with formn. of aminoacetic acid (glycine) but that unchanged \bar{C} reacts with the latter to give (489) (490) (480) iminodiacetic acid ("diglycolamidic acid") HN(CH₂COOH)₂ [Beil. IV-365, IV₁-(481), IV₂-(800)], and/or trimethylamine- α,α',α'' -tricarboxylic acid ("triglycolamidic acid") [Beil. IV-369, IV₁-(482), IV₂-(801)], also obtd. from \bar{C} on fusion with ZnCl₂/NH₃ (492).]

Behavior of \bar{C} with Organic Amines

With primary aliphatic amines. [C with MeNH₂ as directed (497) gives (methylamino)-acetic acid (N-methylglycine = sarcosine) [Beil. IV-345, IV₁-(468), IV₂-(784)], but this prod. is usually prepd. in other ways. — Note, however, that C (2 moles) with MeNH₂ (1 mole) + excess aq. NaOH gives (63-71% yield (493)) (494) methyliminodiacetic acid, CH₃N(CH₂COOH)₂ [Beil. IV-367, IV₂-(800)], cryst. from aq. MeOH, m.p. 226-227° dec. (495), 226° dec. (496).]

[Č with excess aq. EtNH₂ as directed (498) gives ethylaminoacetic acid (N-ethylglycine) [Beil. IV-349, IV₂-(787)], m.p. 180-182° dec. (499), 181.5° dec. (500). — The homologous N-alkylglycines appear never to have been prepared from similar reaction of C with alkylamines, but for prepn. of N-(n-propyl)glycine [Beil. IV-352], m.p. 196-198° dec. (499), N-(isopropyl)glycine [Beil. IV₂-(787)], N-(n-butyl)glycine, m.p. 192° (501), N-(isobutyl)glycine, m.p. 188° (501), or N-(n-amyl)glycine, m.p. 201° (501), by other methods see indic. refs.]

With secondary aliphatic amines. [C with aq. Me₂NH (502) (29) for 4 hrs. at 55° under press. (503) or with aq. NaOH (504) as directed gives (yield Na salt 53% (504)) dimethylaminoacetic acid (N,N-dimethylglycine) [Beil. IV-346, IV₁-(469), IV₂-(785)], m.p. 177-182° (29), 176-178° (503) (for prepn. of this prod. from glycine with formic acid + formaldehyde see (505)). — C with Et₂NH similarly gives (506) N,N-diethylglycine [Beil. IV-350, IV₁-(472)].]

With tertiary aliphatic amines. [C with Me₃N (507) or C (as NaA) with Me₃N (508) gives betaine hydrochloride (CH₃)₃N (Cl).CH₂COOH [Beil. IV-347, IV₁-(470), IV₂-(786)].]

With primary aromatic amines. (See also below under D's.) [$\ddot{\textbf{C}}$ with aniline in a little ether boiled with a large volume of aq. (509), cf. (511), or $\ddot{\textbf{C}}$ with aniline (3 moles) boiled with aq. and subsequently made alkaline (510), or best $\ddot{\textbf{C}}$ with aq. aniline heated in presence

of an acid acceptor such as aq. NaOH (512), aq. NaOAc (573) cf. (514), or other alkali or alkaline-earth hydroxides or carbonates (515) (516) (517) (518) (519) gives (yields: 100% (514), 90% (510), 86% (512)) phenylaminoacetic acid (N-phenylglycine) [Beil. XII-468, XII₁-(263)], m.p. 127° (note that if htd. at 200°, however, bimolecular condensation occurs with elimination of 2H₂O and formn. (520) (521) of N,N'-diphenyl-2,5-diketopiperazine, m.p. 263° (520) (521) while distn. causes loss of CO₂ giving (522) N-methylaniline). — Note also that reaction of C with 2 moles aniline (523), or further reaction of C with N-phenylglycine (above) in aq. alk. (524) (525) (514) (526), gives (yields: 80–85% (526), 50–60% (525)) phenylimino-diacetic acid, C₆H₆N(CH₂COOH)₂ [Beil. XII-480, XII₁-(265)], m.p. 152–155° dec. (526). — Note also that reaction of C with aniline in pres. of NaOAc gives (525) much N-phenylglycine anilide, C₆H₆NHCH₂CONH.C₆H₆ [Beil. XII-556], m.p. 112°_]

[Note that C with many other primary aromatic amines reacts in analogous fashion, but details cannot be included here because of lack of space.]

With primary aromatic diamines. [\overline{C} with o-phenylenediamine in dry ether forms (327) a 1:1 cpd. presumably to be regarded as salt. — However, \overline{C} (1 mole) with o-phenylenediamine (1 mole) in 4 N HCl refluxed (528) for 45 min. and allowed to stand overnight (529) (530) gives (yields: 80-85% (529), 78-86% (530)) 2-(chloromethyl)benzimidazole, ndls. from EtOH/AcOEt (528), pr. from dioxane (529) or dry acctone (530), m.p. 165° (529), $160-161^{\circ}$ (528), $159-160^{\circ}$ cor. (530); note that value is sensitive to rate of htg. (529) (530). — For studies of behavior of this product with many amines (529) (530), with aq. (530), KI in acctone (530) (531) see indic. refs. — For general study of ortho condensations leading to benzimidazole formn. see (532).]

With hydrazines. [\ddot{C} (1 mole) with phenylhydrazine (2 moles) in boilg. aq. alc. K₂CO₃ (½ mole) gives (533) (534) a mixt. of both (α -phenylhydrazine)acetic acid, C₆H₆N(NH₂)-CH₂COOH [Beil. XV-316], tbls. from abs. EtOH, m.p. 168° (533), 167° deo. (535), and (β -phenylhydrazino)acetic acid, C₆H₆NH.NHCH₂COOH [Beil. XV-321], lfts. from alc., m.p. 153° (536), 152–153° (537); for separation of these isomers see (533).]

[For behavior of \bar{C} with N,N-diphenylhydrazine in aq. Na₂CO₃ or NaOAc see (538).]

With aromatic primary amines also containing other functional groups. With aminophenols. [Č with p-aminophenol on htg. in aq. soln. (539) (540) (541) (542) contg. also NaOAc (543) (544) gives (yields 45% (544), 35% (539) N-(p-hydroxyphenyl)glycine [Beil. XIII-488, XIII₁-(171)] (this product has considerable interest as a photographic developer); for its purification see (540) (545); for pat. on its decompn. at 160-170° in ketone solvents as method of prepn. of N-methyl-p-aminophenol [Beil. XIII-441, XIII₁-(149)] see (546). — Note also that in above reaction of Č with p-aminophenol some N-(p-hydroxyphenyl)iminodiacetic acid (542) is also formed.]

With amino acids. [\bar{C} with o-aminobenzoic (anthranilic) acid in aq. soln. (547) preferably also contg. Na₂CO₃ (548) (559) (550) gives (yields: 85–89% (550), 70–80% (549)) N-(o-carboxyphenyl)glycine (phenylglycine-o-carboxylic acid) [Beil. XIV-348, XIV₁-(544)], ndls. from MeOH, m.p. about 215° dec. (551); this product upon htg. loses CO₂ giving indoxyl and is therefore an important intermediate in mfg. of indigo; for use of this reaction for detection of \bar{C} in wine by conversion to indigo see (120) cf. (117). — Note also that in above reaction of \bar{C} with anthranilic acid some N-(o-carboxyphenyl)minodiacetic acid [Beil. XIV-354, XIV₁-(545)], m.p. 216° dec. (551), is also produced (551); although both phenylglycine-o-carboxylic acid (Neut. Eq. 97.5) and N-(o-carboxyphenyl)-iminodiacetic acid (Neut. Eq. 84.3) thus melt at same temp., their mixture melts at about 200° (551).]

With secondary aromatic amines. [C with N-methylaniline on htg. (552) or better in aq. NaOH on 4-hr. reflux (553) gives (74% yield (553)) N-methyl-N-phenylglycine [Beil. XII-473, XII₁-(264)], oil (B.HCl, m.p. 215-216° dec. (553)). — C with N-ethylaniline on

htg. gives (554) N-ethyl-N-phenylglycine [Beil. XII-475], oil. — \bar{C} with diphenylamine at 180-200° for 40-50 hrs. gives (5-10% yield (555)) N,N-diphenylglycine [Beil. XII₁-(264)].]

With tertiary aromatic amines. [C with dimethylaniline at 100° (556) for 12-18 hrs. (557) gives dimethyl-phenylbetaine hydrochloride [Beil. XII-474], m.p. 194-196° (556), from which silver oxide liberates (557) (558) free dimethyl-phenyl-betaine, m.p. 124-126° (557), 123-124° (558). — For corresp. betaine from N,N-diethylaniline see (559).]

With tertiary heterocyclic amines. [C with pyridine on htg. (560) (561) (194) cf. (556) at 60° for 5 hrs. (557) gives N-(carboxymethyl) pyridinium chloride (pyridinebetaine hydrochloride) [Beil. XX-226], m.p. 202-205° dec. (560) (thought by (194) to be typographical error for 102-105° dec.). — For behavior of C with quinoline see (556).]

Behavior of C with Amides, Thioamides, etc.

This topic cannot here be treated in full, but the following cases are reported as examples. With urea. [C] with carbamide (urea) might be expected under appropriate conditions to condense with elimination of HCl and formn. of ureidoacetic acid (hydantoic acid), NH₂CONH.CH₂COOH [Beil. IV-359, IV₁-(477), IV₂-(792)], m.p. 169-170° (562) (563), 160-161° (564), 160° (565), or its ring-closure product hydantoin [Beil. XXIV-242, XXIV₁-(287)], m.p. 220°; no report of the chemical behavior of C with urea can be found, however, the two above-mentioned expected products having been prepared by other means.—Note that f.p./compn. data on system C + urea have been recorded (19).]

With thiourea. [Č with thiourea (the latter reacting in its isothiourea mode) gives according to conditions either isothiohydantoic acid, H₂N—C(=NH)—S—CH₂COOH [Beil. III-251, III₁-(97)] (566) (567), or pseudothiohydantoin [Beil. XXVII-233, XXVII₁-(303)], (568) (569) (570) (571) (572) (573).]

With substituted thioureas. The behavior of \tilde{C} with substituted thioureas cannot be treated in full, but the following examples are cited (for reaction of \tilde{C} with various monosubstituted thioureas see (573) (574), with various disubstituted thioureas see (575) (576) (577)].

- --- Methyl chloroacetate: oil, b.p. 131° (see 3:5585).
- --- Ethyl chloroacetate: oil, b.p. 144° (see 3:5700).
- --- Phenyl chloroacetate: m.p. 44-45° (see 3.0565).
- —— o-Tolyl chloroacetate: oil, b.p. 127-127.6° at 10 mm. (578). [From C with o-cresol (1:1400) + POCl₃ in pyridine (574), or from chloroacetyl chloride (3:5235) with o-cresol (1:1400) at 130° for 4 hrs. (578); note that this prod. with AlCl₃ at 140° undergoes Fries rearr. giving (578) both 2-hydroxy-3-methylphenacyl chloride [Beil. VIII₁-(549)], m.p. 67°, and 4-hydroxy-3-methylphenacyl chloride [Beil. VIII₁-(550)], m.p. 144-145°.]
- m-Tolyl chloroacetate: oil, b.p. 153° at 30 mm. (580). [From chloroacetyl chloride (3:5235) with m-cresol (1:1730) (579) (580); note that this prod. with AlCl₃ at 150° gives (50% yield (580)) 2-hydroxy-4-methylphenacyl chloride [Beil. VIII-113, VIII₁-(550)], m.p. 101°.]
- p-Tolyl chloroacetate: m.p. 32° (580), $29-30^{\circ}$ (579); b.p. 162° at 45 mm. (580); $D_4^{35} = 1.1840$ (41), $n_2^{35} = 1.5150$ (41). [From \bar{C} with p-cresol (1:1410) + POCl₃ in pyridine (579), or from chloroacetyl chloride (3:5235) with p-cresol (1:1410) at 135° (580); note that this prod. with AlCl₃ at 140° gives (580) 2-hydroxy-5-methyl-phenacyl chloride [Beil. VIII-111], m.p. 65° (580).]
- Benzyl chloroacetate: oil, b.p. 147.5° at 9 mm., $D_4^4 = 1.2223$, $n_D^{18} = 1.5246$ (581). [From \bar{C} with benzyl alc. (1:6480) + HCl gas at 100° (581).]

- --- p-Nitrobenzyl chloroacetate: oil, unsuitable as (582).
- --- Phenacyl chloroacetate: unreported.
- --- p-Chlorophenacyl chloroacetate: unreported.
- D p-Bromophenacyl chloroacetate: m.p. 103.7° cor. (583).
- --- p-Iodophenacyl chloroacetate: unreported.
- (584). [From Č (as NaĀ) with p-phenylphenacyl bromide (584) (m.p. 124.5-125.5°) in aq. alc. on htg. (584).]
- © S-Benzylthiuronium chloroacetate: m.p. 159-160° (585). [Note that for corresp. salts from dichloroacetic acid (3:6208) and trichloroacetic acid (3:1150) m.p. values are respectively 178-179° and 148-149° (585).]
- S-(p-Chlorobenzyl)thiuronium chloroacetate: m.p. 158° cor. (586). [From C (as NaA) with S-(p-chlorobenzyl)thiuronium chloride (586) (m.p. 197°) in alc. (586); note that corresp. deriv. of trichloroacetic acid (3:1150) has m.p. 148° cor.]
- S-(p-Bromobenzyl)thiuronium chloroacetate: m.p. 154° cor. (587). [From C (as NaA) with S-(p-bromobenzyl)thiuronium bromide (587) (m.p. 213°) in alc. (587); note that corresp. deriv. of trichloroacetic acid (3:1150) has m.p. 146° cor. (587).]
- ω-Chloroacetamide: m.p. 120.5-121.5° (588), 120° (589), 119-120° (590), 119.5° (591), 118-120° (165), 118° (312), 116.4-116.9° (620). [From methyl chloroacetate (3:5585) (588) (593) or ethyl chloroacetate (3:5700) (590) (589) (592) (594) (595) (596) (597) with cold conc. NH₄OH (78-84% yield (590)), or from chloroacetyl chloride (3:5235) with dry NH₃ (597).]
- Φ-Chloroacetanilide: eryst. from hot aq. or 50% alc, m.p. 138° cor. (598), 136–137° (599), 136° cor. (600), 135° (601), 134–135° (602) (166), 134.5° (603) (604), 134° (605) (606), 133–134° (610). [From $\bar{\mathbb{C}}$ with aniline (606) in presence of P_2O_5 (600) (605), from $\bar{\mathbb{C}}$ with aniline salts + PCl₅ or SOCl₂ (607), from chloroacetyl chloride (3:5235) with aniline (2 moles) in ether (608) (603), C_6H_6 (602) (601), or AcOH/NaOAc (599) or with aniline (1 mole) + aq. NaOH in C_6H_6 or toluene (609), or from chloroacetic acid anhydride (3:0730) with aniline + P_2O_5 (610) | Note that this ω-chloroacetanilide with AlCl₃ (not more than 1.8 pts. (611)) at 225° (611) (612) loses HCl with ring closure giving (85% yield (611) (612)) oxindole [Beil. XXI-282, XXI₁-(289)]; also that ω-chloroacetanilide with alc. KOH undergoes bimolecular condensation giving (613) N,N'-diphenyl-2,5-diketopiperazine, m.p. 263°.]
- Φ ω-Chloroacet-o-toluidide: cryst. from dil. alc., m.p. 111-112° (614) (604), 111° (615). [From \bar{C} + o-toluidine + P_2O_5 (615), or from chloroacetyl chloride (3:5235) with o-toluidine (2 moles) in dry ether (616) or C_6H_6 (614).] [Note that this prod. with AlCl₃ at 225° loses HCl with ring closure giving (612) 7-methyloxindole, m.p. 200°; also that with alc. KOH it undergoes bimolecular condensation giving (614) N,N'-di-o-tolyl-2,5-diketopiperazine.]
- ω-Chloroacet-p-toluidide: m.p. 164° (615), 162° (608) (617), 161.5° (603). [From \bar{C} (2 moles) with p-toluidine (1 mole) at 80-90° (617) in presence of P_2O_5 (615), or from chloroacetyl chloride (3:5235) with p-toluidine (2 moles) (608) in ether (603).] [Note that this prod. with AlCl₃ at 230° for 2 hrs. loses HCl with ring closure giving (612) 5-methyloxindole [Beil. XXI-291], m.p. 168° (612).]
- ω-Chloroacet-N-benzylamide: cryst. from C₆H₆ or lgr., m.p. 93.5-94.5° cor. (618), 93.0-93.6° cor. (619), 92.2-92.8° u.c. (619). [From ethyl chloroacetate (3:5700) with aq. benzylamine on shaking in cold (619) cf. (621), or from chloroacetyl chloride (3:5235) with benzylamine + aq. KOH (618); note, however, that the corresp. derivs. from dichloroacetic acid (3:6208) and from trichloroacetic acid (3:150) have almost the same m.p.'s, viz., 93.8-95.6° cor. and 93.6-94.4° cor. respectively (619); note also that the simple salt of C with benzylamine has m.p. 119.9-120.9° cor. (304).]

$$\alpha,\beta$$
-DICHLORO- n -BUTYRIC $C_4H_6O_2Cl_2$ Beil. II - 279 ACID (low-melting isomer) H H H II_1-(124) (Crotonic acid dichloride) CH_3 -C-COOH II_2 -

196

[See also α,β -dichloro-n-butyric acid (high-melting isomer) (isocrotonic acid dichloride) (3:1903).]

Colorless cryst. from pet. ether, lgr. or dry ether. — \bar{C} is eas. sol. alc., C_6H_6 , CHCl₃, or CS₂; spar. sol. cold lgr.; at 10.5° 3.28 pts. \bar{C} are sol. in 1 part dry ether. — \bar{C} deliquesces with a little aq. (5); \bar{C} with 1 mole H_2O forms (4) an oil, probably a monohydrate (ortho acid), which in much aq. gives an emulsion gradually separating into two clear layers; note, however, that \bar{C} has later (11) been claimed to be nonhygroscopic.

[For prepn. of \overline{C} from crotonic acid (1:0425) with Cl_2 in CS_2 (1) (2) (3) (4) (11) or in $CCl_4 + CS_2$ (6) in cold see indic. refs.; for form. of \overline{C} from isocrotonic acid (1:1045) with Cl_2 in $CHCl_3$, CCl_4 , or CS_2 see (6) (4); for prepn. of \overline{C} from its corresp. acid chloride (see below) by hydrolysis with aq. NaHCO₃ see (5) (9).]

Č boils at 212-216° under ord. press. with some loss of HCl (4).

[C with 6 pts. conc. aq. HCl (satd. at 0°) in s.t. at 100° for 50 hrs. (1) is partially isomerized to the high-melting stereoisomer (isocrotonic acid dichloride) (3:1903).]

 $\tilde{\mathbf{C}}$ behaves as a fairly strong monobasic acid of ionization const. $K = 8.2 \times 10^{-3}$ (1); $\tilde{\mathbf{C}}$ with dil. aq. AgNO₃ ppts. the spar. sol. AgĀ₂ (5); no other salts, however, appear to have been reported.

 $\tilde{\mathbf{C}}$ with aq. NaOH in cold is neutralized without serious decomposition (4); Neut. Eq. = 157 (11); however, if to the resulting soln. further conc. aq. NaOH is added (4) (7), or if $\tilde{\mathbf{C}}$ in alc. is treated with alc. KOH (6) (2), 1 HCl is split away and the corresp. salt of α -chloroisocrotonic acid (3:1615) (accompanied by the salt of its isomeric α -chlorocrotonic acid (3:2760)) is formed.

Č with aq. Na₂CO₃ at ord. temp. is neutralized without decompn. (4); however, Č with excess aq. Na₂CO₃ above 80° also is further attacked giving (4) (25–30% yield (4)) 1-chloropropene-1 (3:7030), accompanied by some propional dehyde (1:0110), α-chlorocrotonic acid (3:2760), α-chloroisocrotonic acid (3:1615), and other products.

 \ddot{C} in pyridine at 100° for 3 hrs. loses HCl giving (yield not reported (8)) α -chlorocrotonic acid (3:2760), m.p. 99.5° (8).

[$\bar{\mathbf{C}}$ with PCl₅ or SOCl₂, although not actually reported, would be expected to yield the corresp. acid chloride; this α,β -dichloro-n-butyryl chloride, b.p. 163.3-164.3° cor. at 747 mm. (5), 67.5-71° at 30 mm. (5), has, however, been prepd. indirectly from crotonic acid (1:0425) with PCl₅ (2 moles) at 160° for 2 hrs. (9) or from crotonaldehyde (1:0150) with Cl₂ at 0° in dark (5).]

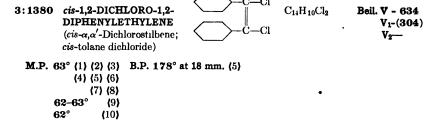

Methyl α,β -dichloro-n-butyrate: b.p. 174–180° sl. dec. at ord. press. (5), 82.7–85.7° cor. at 28 mm. (5); $D_4^{18.3} = 1.2614$ (5). [From the above α,β -dichloro-n-butyryl chloride with MeOH (5).]

- Ethyl α,β-dichloro-n-butyrate: b.p. 180-200° at 760 mm. (10), 97° at 35 mm. (10), 96° at 35 mm. (2). [From Č in abs. EtOH with dry HCl (2), or indirectly from butyr-chloral hydrate (3:1905) (1 mole) in EtOH with dry KCN (1 mole) below 15° (10); note, however, that this ester loses HCl with great ease even at ord. temp. giving ethyl α-chlorocrotonate (3:8523) and this dehydrohalogenation is greatly accelerated by KCN (10).]
- —— α,β-Dichloro-n-butyramide: unreported. [Note that the amide from the higher-melting stereoisomer of C

 (3:1903) has m.p. 121°.]

3:1375 (1) Michael, Bunge, Ber. 41, 2910-2912 (1908). (2) Michael, Browne, Am. Chem. J. 9, 281-287 (1887). (3) Michael, Browne, J. prakt Chem. (2) 36, 174-176 (1887). 61° (11) 60° (12) 59.5-60° (13) 58° (14)

[See also trans-1,2-dichloro-1,2-diphenulethulene (3:4210).]

Colorless ndls. — \bar{C} is much less sol. in alc. than its higher-melting stereoisomer (3:4210); 100 pts. abs. alc. at 24.4° dis. 10.51 pts. \bar{C} (14). — \bar{C} like its isomer is very sol. in ether.

Note that \bar{C} (the lower-melting tolane dichloride) has now been shown (12) to have the css configuration, many earlier reports to the contrary notwithstanding.

Note also that \bar{C} (2 moles) with (1 mole) diphenylacetylene (tolane) [Beil. V-656, V₁-(319), V₂-(568)], m.p. 60°, gives (12) a 2:1 molecular cpd., m.p. 67-69° (12).

 \tilde{C} on distn. is partially transformed (32% (14)) into its higher-melting trans stereoisomer (3:4210) q.v.

Since the methods of prepn. and the chemical behavior of $\ddot{\mathbf{C}}$ are the same as those given in detail under its stereoisomer (3:4210) q.v. they are not repeated here.

KOH, pyridine, or quinoline (9) from β - or γ -benzene-hexachlorides with alc. KOH see (9) cf. (26).]

[\tilde{C} with Cl₂ in pres. of Al/Hg yields (27) 1,2,3,5-tetrachlorobenzene (3:0915); for behavior of \tilde{C} with liq. Cl₂ yielding addn. products see (28)]

[C with MeOH/NaOMe in s.t. at 180° yields mainly (29) 3,5-dichloroanisole, m.p. 39° (29), accompanied by some 3,5-dichlorophenol (3:1670).]

 $[\bar{C}$ on hydrolysis with steam at 550-800° over cat. yields (30) phloroglucinol (1:1620); for behavior of \bar{C} with F_2 see (31); for behavior of \bar{C} with NH₃ at 700-800° see (32).]

 \bar{C} on mononitration, e.g., by warming \bar{C} (1 g.) with 5 ml. fumg. HNO₃ (D=1.49) at 100° for 15 min., then pouring onto ice (38), gives (2) (8) (100% yield (38)) 1,3,5-trichloro-2-nitrobenzene [Beil. V-247], ndls. from alc., m.p. 69° (8), 67-68° (38). — \bar{C} on dinitration, e.g., by refluxing for 1 hr. a soln. of \bar{C} (1 g.) in 5 ml. fumg. HNO₃ (D=1.49) + 5 ml. conc. H₂SO₄ (38), gives (yield: 100% (38) (34), 82% (35), 80% (15)) (14) (33) 1,3,5-trichloro-2,4-dinitrobenzene [Beil. V-265], m.p. 131-131.5° (35) (36), 129-130° (34), 129.5° (14) (15) (3), 128.5° (38) (this prod. on htg. with 5 pts. aniline yields (38) 1,3,5-trianilino-2,4-dinitrobenzene, m.p. 179-180° (38)). — \bar{C} on trinitration, e.g., by boilg. 2 days with mixt. of

fumg. HNO₃ and fumg. H₂SO₄ as directed (37) (39), yields (37) (33) (17) 1,3,5-trichloro-2,4,6-trinitrobenzene [Beil. V-275], m.p. 187° (33), 193° (15), 192-193° (39).

Č with conc. H₂SO₄ is unchanged even after htg. 56 hrs. at 100° and is only partially sulfonated on htg. 6 hrs. at 100° with fumg. H₂SO₄ (12% SO₃) (16); however, Č with 3 pts. fumg. H₂SO₄ (SO₃ = 72%) htd. at 100° for 15 hrs. completely sulfonates yielding (16) 1,3,5-trichlorobenzene-2,4-disulfonic acid (corresp. disulfonyl chloride, m.p. 161.5° (16), corresp. disulfonamide, m.p. 248° (16)).

Č with chlorosulfonic acid in CHCl₃ (38) gives 1,3,5-trichlorobenzenesulfonyl chloride, m.p. 35-40° u.c. (38); this prod. with (NH₄)₂CO₃ readily yields (38) 1,3,5-trichlorobenzenesulfonamide, m.p. 210-212° u.c. dec. (38).

M.P. 64° (1) (2) (3) 63-64° (5)

Colorless lfts. from alc. — 100 pts. 90–92% alc. dis. at room temp. 5.40 pts. \bar{C} ; in hot 37.28 pts. \bar{C} (4).

[For prepn. of \bar{C} from chloral (3:5210) with C_6H_6 (2 moles) + conc. H_2SO_4 (almost quant. yield) see (3); from chloral hydrate (3:1270) with C_6H_6 + a little AlCl₃ at 0° see (5) cf. (2); note that both types of this same condensation take place through intermediate formn. of trichloromethyl-phenyl-carbinol [Beil. VI-476, VI₁-(237)], m.p. 37°, b.p. 145° at 15 mm. (1) (corresp. acetate, m.p. 87.5° (1)) as formerly suspected (6) and subsequently confirmed (1).]

C on reduction gives various products according to conditions [e.g., C with Na/Hg in

alc. is claimed (7) to give 1,1-diphenylethane [Beil. V-605, V_1 -(285), V_2 -(509)], but this prod. was not obtd. in pure form and was accompanied by 1,1-dichloro-2,2-diphenylethylene (3:1938) (from \ddot{C} by loss of HCl under alk. conditions)].

[$\tilde{\mathbf{C}}$ in boilg. 95% alc. contg. trace of CuCl₂ with finely powdered Al/Cu/Zn (Devarda) alloy or Cu/Mg (Arnd) alloy for 6-10 hrs. gives (13-19% yield (8)) 2,2,3,3-tetrachloro-1,1,4,4 tetraphenylbutane [Beil. V₂-(676)], ndls. from AcOH, m.p. 188-190° (8), accompanied by some 2,3-dichloro-1,1,4,4-tetraphenylbutene-2 (see next paragraph). $\tilde{\mathbf{C}}$ with Zn dust + conc. aq. NH₄OH in alc. soln. gives (18) (4) stilbene (1:7250) + 1,1-diphenylethane (above).]

[\bar{C} on reduction with H₂ in pres. of Pd/BaCO₃ in alc./pyridine soln. gives (54-60% yield (9)) 2,2,3,3-tetrachloro-1,1,4,4-tetraphenylbutane (see preceding paragraph) accompanied by both high-melting (137-138°) and low-melting (108-110°) stereoisomers of 2,3-dichloro-1,1,4,4-tetraphenylbutene-2 [Beil. V₂-(685)]; using Ni as cat. the same prods. result (9) in lower yield sometimes accompanied also by 1,1-dichloro2,2-diphenylethylene (3:1938) (from \bar{C} by loss of HCl).]

[$\overline{\mathbf{C}}$ on reduction by electrolytic means in various types of solution, with various metallic electrodes, and at various temperatures gives (10) (11) numerous products including 1,1-dichloro-2,2-diphenylethane (3:1938), 1-chloro-2,2-diphenylethane [Beil. V-606, V₁-(285)], 1,1,4,4-tetraphenylbutine-2 [Beil. V₁-(379), V₂-(694)], etc.; for details see (10) (11).]

[$\bar{\mathbf{C}}$ with Cl₂ under suitable conditions should give 1,1,1,2-tetrachloro-2,2-diphenylethane [Beil. V-606], m.p. 85°, but this reaction has not actually been reported. — However, $\bar{\mathbf{C}}$ with a very large excess (15 pts.) pure liquid Br₂ gives (12) 2-bromo-1,1,1-trichloro-2,2-diphenylethane, m.p. 87.5° (12)]

[No mono- or di-nitration products derived from C have been reported.]

Č on distillation (13), or on boilg, with alc. KOH (2) (14) (for study of rate see (15)), or during course of other reactions involving alkaline conditions (see above) loses HCl giving 1,1-dichloro-2,2-diphenylethylene (3:1938). m.p. 80° (2).

[Č with NaOEt in s.t. at 180° ultimately gives (2) cf. (16) (and presumably through intermediate 1,1-dichloro-2,2-diphenylethylene (3:1938)) diphenylacetic acid (1:0765).]

 \bar{C} with Na in C_6H_6 refluxed 10-12 hrs. and then treated with alc. gives (17) cf. (2) trans-1,2-diphenylethylene (stilbene) (1:7250), m.p. 124°, cis-1,2-diphenylethylene (isostilbene) [Beil. V-633, V₁-(303), V₂-(539)], and diphenylacetylene (tolane) [Beil. V-656, V₁-(319), V₂-(568)]. — \bar{C} with Zn dust on dry distn. gives (13) stilbene (1:7250).

[\bar{C} in C_6H_6 with AlCl₃ gives (10% yield (20)) 1,1,2,2-tetraphenylethane [Beil. V-739, V_1 -(371), V_2 -(673)], m.p. 211°.]

[For use of \bar{C} as addn. agent to improve lubricating power of mineral oils under high pressures see (19).]

3:1480 2,3-DICHLOROBENZALDEHYDE

C₇H₄OCl₂

Beil. S.N. 635

M.P. 65-67° (1)

Cryst. from 1:1 aq EtOH.

[For prepn. of C from 2,3-dichlorotoluene (3:6345) by bromination at 180-200° (presumably to 2,3-dichlorobenzal (di)bromide) followed by hydrolysis with conc. H₂SO₄ at 100-140° (71% yield) see (1).]

C with MeMgI gives (76% yield (1)) 2,3-dichlorophenyl-methyl-carbinol, m.p. 55-57°, b.p. 112-113° at 2 mm. (corresp. 3,5-dinitrobenzoate, m.p. 145-146° (1)); note that dehydration of the carbinol with KHSO₄ gives (44% yield (1)) 2,3-dichlorostyrene.

- ---- 2,3-Dichlorobenzaldoxime: unreported.
- ---- 2,3-Dichlorobenzaldehyde phenylhydrazone: unreported.
- ---- 2,3-Dichlorobenzaldehyde p-nitrophenylhydrazone: unreported.
- ---- 2,3-Dichlorobenzaldehyde 2,4-dinitrophenylhydrazone: unreported.
- ---- 2,3-Dichlorobenzaldehyde semicarbazone: unreported.
- 3:1480 (1) Marvel, Overberger, Allen, Johnston, Saunders, Young, J. Am. Chem. Soc. 68, 862 (1946).

3:1490 2-CHLORONAPHTHOL-1

$$\begin{array}{cccc} OH & C_{10}H_7OCl & \text{Beil. VI - 611} \\ & & \text{VI}_{1}\text{-}(308) \\ & & \text{VI}_{2}\text{-}(581) \\ \end{array}$$

Ndls. from lgr.; exceptionally easily sol. in alc., ether, C_6H_6 . — More volatile with steam than the isomeric 4-chloronaphthol-1 (3:3720) (use in sepn. (2)).

[For prepn. of \bar{C} from α-naphthol (1:1500) with aq. alk. NaOCl (3) (4) (5) or with SO₂Cl₂ in CHCl₃ soln. (18% yield, together with 42% yield of 4-chloronaphthol-1 (3:3720) (2)), see indic. refs.; from sodium 1-hydroxynaphthalenesulfonate-2 [Beil. XI-269, XI₁-(63)] with PCl₅ see (6); from 2-chloro-1-hydroxynaphthalenesulfonic acid-4 (1) by hydrolysis in boilg. dil. H₂SO₄ see (1).]

C on stdg. in aq. Na₂CO₂ soln. gives blue flocks (7).

Č with 1 mole Br₂ in 20% AcOH yields alm. quant. (7) 4-bromo-2-chloro-naphthol-1, ndls., m.p. 112° (7).

[$\bar{\mathbf{C}}$ with conc. HI (D=1 5) in boilg. AcOH for 12 hrs. reduces (4) to α -naphthol (1:1500), but $\bar{\mathbf{C}}$ is unaffected by SnCl₂ + HCl in alc. even after 28 hrs.' boilg. (4).]

[\bar{C} on oxidn. with p-diamines gives (3) indophenols; \bar{C} on coupling with diazonium salts gives (3) azo dyestuffs, cf. (1); \bar{C} with isatın chloride [Beil. XXI-302, XXI₁-(296)] yields (5) a chloronaphthalene indolindigo.]

[C dislvd. in a little alc., made ammoniacal with conc. NH₄OH, and treated at 5° with nitrosobenzene in alc. gives (84% yield (8)) 2-chloronaphthoquinone-1,4-monoanil-4 (see under 3:3580), very red ncls. from alc., m p. 112° (8).

3:1490 (1) Hodgson, Rosenberg, J. Soc. Chem. Ind. 48-T, 287-289 (1929). (2) Lesser, Gad, Ber. 56, 972-973 (1923). (3) Kalle and Co., Ger. 167,458, Jan 22, 1906; Cent. 1906, I 1067. CHAPTER V

DIVISION A. SOLIDS

(3:1500-3:1999)

3:1505 3.5-DICHLOROBENZOPHENONE

C₁₃H₈OCl₂

Beil. S.N. 652

(3,5-Dichlorophenyl phenyl ketone)

CI C=0

M.P. 65° (1) (2)

Ndls. (from MeOH (1)).

[For prepn. from 3,5-dichloro-4-aminobenzophenone (1) by removal of amino group via diazo reaction see (1); for prepn. from 3,5-dichlorobenzohydrol by oxidn. with CrO₃ (75% yield) see (2).]

 \overline{C} fused for 3 hrs. at 200° with a mixt. of KOH + NaOH gives (2) BzOH (1:0715) and a trace of m-dichlorobenzene (3:5960).

- ₱ 3,5-Dichlorobenzophenone oxime: from C in alc. on refluxing 8 hrs with NH₂OH HCl + excess NaOH: after distilling off the alcohol, the mixt of two stereoisomeric oximes is pptd. by pouring into aq.; sepn. of the two isomers can be effected by fractnl. crystn. from dil. MeOH or dil. EtOH (1).
- α-form (less-soluble isomer), pl. or fine ndls., m.p. 137°. [With PCl₅ in dry ether, followed by water, this form yields quant. 3,5-dichlorobenzanilide, ndls. from dil. alc., m.p. 148° (1).]
- β-form (more-soluble isomer), constituting 70% of reaction mixt., pr. m.p. 118°. [With PCl₅ in dry ether, followed by water, this form yields a gummy product from which some benz-3,5-dichloroanilide, ndls. m.p. 148.5°, can be sepd. (1).]
- 3:1505 (1) Waters, J. Chem. Soc. 1929, 2108-2109. (2) Lock, Rödiger, Ber. 72, 869-870 (1939).

3:1535 4-CHLORO-3-METHYLPHENOL OH C₇H₇OCl Beil. VI - 381 VI₁-(187) VI₂-(355)

M.P. 66° (1) (11) B.P. 235° (1) 57° (2) 234–236° (11) 55.5° (3)

Note that C is often designated in the literature as "p-chloro-m-cresol" or even as "6-chloro-m-cresol"; care must be taken to avoid confusion with the isomeric 6-chloro-3methylphenol (3:0700).

Odorless cryst. (from lgr.). — Volatile with steam (3).

Both the low-melting and high-melting forms appear to be authentic; whether they are different cryst. forms has never been detd.

[For prepn. of C from 2-chloro-5-aminotoluene (4-chloro-3-methylaniline) [Beil. XII-871] via diazo reaction see (3); for comml. prepn. from m-cresol (1:1730) by chlorination with SO₂Cl₂ see (1) (4) (84% yield (11)).]

[C on monobromination with Br2 in AcOH gives (8) 4-chloro-6-bromo-3-methylphenol, m.p. 70.0-70.5° (8); C on dibromination yields (9) 4-chloro-2,6-dibromo-3-methylphenol, m.p. $68.5-69.5^{\circ}$ (9) (for use of latter in bromometric detn. of \bar{C} see (10)).

 \bar{C} treated with $(CH_3)_2SO_4 + aq$. NaOH gives its methyl ether, 4-chloro-3-methylanisole, b.p. 213.5° (2). [This methyl ether on oxidn. with dil. KMnO₄ (6.7 hrs. for 5 g.) gave (2) 2-chloro-5-methoxybenzoic ac. [Beil. X-143], ndls. from dil. AcOH (5), m.p. 173.5° (2), 170-171° (5), Neut. Eq. 186.5.

- \oplus 4-Chloro-3-methylphenyl benzoate: from $\bar{C} + BzCl + pyridine$, pl. from alc., m.p. 86° (2) (3). [This benzoate htd. with 0.7 of its wt of AlCl3 for 10 min. at 140° gives by Fries rearrangement 100% yield (6) of 2-hydroxy-5-chloro-4-methylbenzophenone. vel. ndls. from dil. alc., m.p. 142° (6)]
- \odot 4-Chloro-3-methylphenyl benzenesulfonate: from \ddot{C} + benzenesulfonyl chloride + pyridine, pl. from alc., m.p. 66° (3). [Note that this value is numerically the same as orig. C and that the deriv. must therefore be distinguished from it, e.g., by mixed m.p. or behavior with alk.l
- \oplus 4-Chloro-3-methylphenyl p-toluenesulfonate: from \bullet + p-toluenesulfonyl chloride + pyridine, pl. from alc. (2) (3), ndls. from lt. pet (2), m.p. 98° (2) (3). [Note that this deriv. does not distinguish C from 6-chloro-3-methylphenol (3:0700) or 2-chloro-3methylphenol (3:1055).]
- ① 4-Chloro-3-methylphenyl $N-\alpha$ -naphthylcarbamate: from $\ddot{C} + \alpha$ -naphthyl isocyanate in presence of trace of trimethyl- or triethyl-amine in ether; cryst. from lgr., m.p. 153-154° (7).
- 3:1535 (1) Kalle and Co., Jan. 11, 1897, Ger. 90,847, Friedländer 4, 94 (1894 /7). (2) Gibson, J. Chem. Soc. 1926, 1425-1428. (3) Huston, Chen, J. Am. Chem. Soc. 55, 4214-4218 (1933). (11) Sah, Anderson, J. Am. Chem. Soc 63, 3165 (1941).

M.P. 66-67° (1) (2) (3)

Colorless lfts. or ndls., sol. in alc., ether, CHCl3, or C6H6. [For prepn. of C from 2,5-dimethylhexanediol-2,5 [Beil. I-492, I₁-(256), I₂-(557)] with fumg. HCl (1) or AcCl (1) or in AcOH with HCl gas (100% yield (3)) see (1) (3); from the ring-closed internal ether of the above diol, viz., 2,2,5,5-tetramethyltetrahydrofuran [Beil. XVII-17], with fumg. HCl see (2); for prepn. of \bar{C} from 2,5-dimethylhexadiene-2,4 (di-isocrotyl) [Beil. I-259, I_1 -(122), I_2 -(237)] with HCl in s.t. see (2).]

C on htg. boils at 180° with evolution of HCl (1).

[\bar{C} on slow distn. at 12-20 mm. over CO₂ saturated soda-lime at 255-270° gives (3) by loss of 2 HCl 2,5-dimethylhexadiene-2,4 (see above), m.p. + 6° (2).]

[For study of behavior of \vec{C} with aq. alc. N/10 NaOH see (4).]

Co.), U.S. 2,377,751, June 5, 1945; C.A. 39, 4097 (1945).

3:1595 2,8-DICHLOROPHENOL OH C₆H₄OCl₂ Beil. VI - 190 VI₁-(103) VI₂-(179)

M.P. 67° (1) (2) B.P. 219–220° at 740 mm. (2) cf. (3) 66–68° (8) 80–85° at 4 mm. (2)

Cryst. from pet. eth. with penetrating odor suggesting o-chlorophenol or (if dilute) iodoform. — Misc. with alc., ether, volatile with steam.

[For prepn. from p-hydroxybenzoic ac. (1:0840) by chlorination in AcOH followed by elimin. of CO_2 by htg. in quinoline see (4) (5) (8); for prepn. from phenol (1:1420) by prelim. sulfonation, subsequent chlorination in nitrobenzene, and final removal of sulfonic acid group by hydrolysis (70% yield (2)) see (2).]

C is sol. in Na₂CO₃ soln. (1). [For study of ionization const. see (6).]

Č on nitration (no details) gives 2,6-dichloro-4-nitrophenol [Beil. VI-241], colorless ndls. from aq., m.p. 125° (7).

 \bar{C} dislvd. in aq. alk. and shaken with $(CH_3)_2SO_4$ yields (1) (2) the methyl ether, 2,6-dichloroanisole, b.p. 105-106° at 20 mm. (2), m.p. 10.1° (1).

[For study of rearr. of ethers (8) or esters (9) of C see indic. refs.]

- **2.6-Dichlorophenyl benzoate:** m.p. 74.0-74.5° (9).
- 2,6-Dichlorophenyl p-nitrobenzoate: unreported.
 - ____ 2,6-Dichlorophenyl 3,5-dinitrobenzoate: unreported.
- --- 2,6-Dichlorophenyl benzyl ether: m.p. 39.5-40° (10).
- **2.6-Dichlorophenyl** p-nitrobenzyl ether: unreported.
- 2,6-Dichlorophenoxyacetic acid: ndls. from aq., m.p. 134.5-135.0° cor. (9).
 Vith chloroacetic acid (3·1370) + aq. alk. (9)
- ---- 2,6-Dichlorophenyl N-phenylcarbamate: unreported.
- **2,6-Dichlorophenyl** $N-(\alpha-naphthyl)$ carbamate: unreported.
- 2,6-Dichlorophenyl N-(β-naphthyl)carbamate: unreported.

3:1595 (1) Holleman, Rec. trav. chim. 37, 96-103 (1918). (2) Huston, Neeley, J. Am. Chem. Soc. 57, 2177 (1935). (3) Seifart, Ann. Suppl 7, 203 (1870). (4) Richardson, J. Chem. Soc. 1937, 1364. M.P. 67.0-67.5° (1) 66-67° (2) 67° (3) 66.2-66.5° (4) (5) 66° (6) (7)

[See also a-chlorocrotonic acid (3:2760).]

Ndls. from aq. (2) (4) (5); note, however, that from aq. solns. of salts acidification first ppts. \bar{C} as an oil. — \bar{C} is more sol. aq. than its stereoisomer; e.g., \bar{C} is sol. in 15.3 pts. aq. at 19° (8). — \bar{C} is much more volatile with steam than its stereoisomer (3:2760) (4) (5). — \bar{C} is spar, sol. cold but eas. sol. hot lgr. (8).

Preparation. [For prepn. of \bar{C} from lower-melting form (m.p. 63°) of α,β -dichloro-n-butyric acid (3:1375) with excess 10% aq. NaOH at not above 10° see (4) (5) cf. (9).]

Chemical behavior. \bar{C} on htg. in s.t. at 150-160° for 12 hrs. (10), or with pyridine hydrochloride in pyridine 7 days at room temp. or rapidly at 100° (2), or even slowly on steam distillation (11) is converted to the stereoisomeric α -chlorocrotonic acid (3:2760), m.p. 99°.

Č on reduction with Na/Hg in aq. is dehalogenated yielding (12) (4) crotonic acid (1:0425), m.p. 72°; whether any isocrotonic acid (1:1045), b.p. 169°, m.p. 15°, is formed at all is uncertain.

 \bar{C} with Cl_2 in CS_2 adds 1 mole halogen yielding (13) the same α, α, β -trichloro-n-butyric acid (3:1280), m.p. 59.5-60°, also obtd. by like treatment of α -chlorocrotonic acid (3:2760). — The behavior of \bar{C} with Br_2 appears to be unreported.

 $\ddot{\mathbf{C}}$ behaves as a monobasic acid; dissociation const. at 25° is 1.58 \times 10⁻³ (14); Neut. Eq. 120.5.

Salts. [K \overline{A} , ndls. from alc. in which it is much more sol. (viz., 1 pt K \overline{A} in 22 pts. 99.5% alc. at 16.5° (4)) than its stereoisomer (use in sepn. (2) (9)), eas. sol. aq., Ba $\overline{A}_2.31/2H_2O$, eas. sol. aq. but spar. sol. alc. (8); Pb $\overline{A}_2.H_2O$, ppt. (8).]

[For study of rate of reactn. of C with K₃AsO₃ see (3)]

The acid chloride of C is unreported.

- Methyl α-chloroisocrotonate: unreported. [However, for study of rate of esterification of C with MeOH see (15).]
- Ethyl α-chloroisocrotonate: oil; see 3:9368. [Note also that C in EtOH with conc. H-SO₄ at 100° gives only (7) the stereoisomeric ethyl α-chlorocrotonate (3:8523).]
- ---- α-Chloroisocrotonamide: unreported.
- α -Chloroisocrotonanilide: unreported.
- α -Chloroisocroton- α -naphthalide: unreported.

 Wisland, Z. physik. Chem. 3, 244 (1889).

Michael, Oechslin, Ber. 42, 322 (1909).

White cryst. from MeOH, EtOH, lgr., or CHCl₃ by addn. of lt. pet. — Note that on distillation under reduced press. \bar{C} goes over with only slight decompn. as a green vapor which condenses to a green liquid; on solidification much of this color is lost and recrystallization yields colorless \bar{C} . — \bar{C} is quite stable in dark; in sunlight, however, it turns brown and decomposes.

65.5°

 65°

(10)

(11) (12)

PREPARATION OF C

[For prepn. of \bar{C} from benzoin (1:5210) with SOCl₂ in pyridine (yield 74-79% (9)) (5) or with SOCl₂ directly (yield 90% (6)) (2) (3) (10) (13) see indic. refs. — Note that l-benzoin with SOCl₂ undergoes racemization (7) yielding \bar{C} .]

[For form. of \bar{C} from α,α -dichlorobenzyl phenyl ketone (ms,ms-dichlorodesoxybenzoin) [Beil. VII-436, VII₁-(234)] by partial dehalogenative reduction using H_2 + platinum oxide cat. (65% yield (1)) or AcOH + Fe powder at 70-80° (15) see indic. refs.; from 1,2-diphenyl-1,2-epoxyethylene (diphenyloxene) with conc. HCl in s.t. at 120° for 2 hrs. see (11); from benzoyl-phenyl-diazomethane (azibenzil) [Beil. VII₁-(395)] in ether with HCl gas see (12)]

CHEMICAL BEHAVIOR OF C WITH INORGANIC REAGENTS

Reduction. [C̄ in alc. soln. with H₂ + platinum oxide cat. (1), or in AcOH with Fe powder on protracted treatment (14), gives benzyl phenyl ketone (desoxybenzoin) (1:5165).]

Oxidation. [C̄ with conc. HNO₃ on warming gives (14) dibenzoyl (benzil) (1:9015).]

Halogenation. [C with Br₂ (1 mole) in AcOH at 100° for ½-hr. gives (10) α-bromo-α-chlorobenzyl phenyl ketone, m.p. 85°.]

Behavior with alkalies and alkali carbonates. (For alc. alkalies see below under organic reactants.) — $[\bar{C}$ with powdered KOH (3 moles) in toluene refluxed 2 hrs. loses HCl and rearranges giving (20% yield (11)) 1,2-diphenyl-1,2-epoxyethylene (diphenyloxene), b.p. 174-180° at 18 mm., m.p. 52°; note, however, that two later workers (15) (29) have been unable to duplicate this report. — Note, however, that \bar{C} with powdered KOH in dry ether gives (15) a mixt. of benzoic acid (1:0715), diphenylacetic acid (1:0765), desoxybenzoin (1:5165), and benzil (1:9015).]

[C with excess ignited Na₂CO₃ at 200° without solvent for 1 hr. gives (11) a mixt. (yield not stated) of both stereoisomeric 1,2-dibenzoyl-1,2-diphenylethylenes (dibenzoylstilbenes): higher-melting isomer [Beil. VII-844], m.p. 232°; lower-melting isomer [Beil. VII-843, VII₁-(453)], m.p. 212-214°.]

[Č with NaSH in alc. soln. in cold gives (16) benzoyl-phenyl-carbinyl mercaptan (desylthiol), m.p. 42-44° (benzoyl ester, m.p. 110-112° (16)), accompanied by two forms of didesyl sulfide, one of m.p. 168-169°, the other of m.p. 128-129° (16).

Behavior with metals. [\bar{C} with Na in C_6H_6 evolves H_2 and on warming gives a mixt. which with aq. followed by dil. acid gives (2) a mixt. of benzoic acid (1:0715) + benzilic acid (1:0770) together with an unidentified neutral oil.]

Behavior with other inorganic reactants. [Č with moist silver oxide in ethylene glycol at 100° for 3 hrs., then boiled 2 hrs., gives (29) 1,2-dibenzoyl-1,2-diphenylethane (bidesyl) [Beil. VII-841, VII₁-(452)], m.p. 254-255° (29).]

CHEMICAL BEHAVIOR OF C WITH ORGANIC REACTANTS

Behavior with arom. hydrocarbons + AlCl₃. $[\bar{C} \text{ with } C_6H_6 (1:7400) + AlCl_3 \text{ gives } (78\% \text{ yield } (17)) (18) (19) \omega, \omega-\text{diphenylacetophenone } (ms-\text{phenyldesoxybenzoin} = \text{triphenyl-vinyl alc.})$ [Beil. VII-522, VII₁-(291)], m.p. 137° (19), 135–136° (17) (18). $-\bar{C}$ with toluene (1:7405) + AlCl₃ gives (77% yield (17)) ω -phenyl- ω -(p-tolyl)acetophenone (α -(p-tolyl)desoxybenzoin), m.p. 97–98° (17). $-\bar{C}$ with mesitylene (1:7455) + AlCl₃ in CS₂ gives (13) ω -phenyl- ω -mesitylacetophenone (α -mesityldesoxybenzoin), m.p. 111–112° (13).] (See also below under reactn. of \bar{C} with RMgX cpds.)

Behavior with organic hydroxy or mercapto compounds. With alcohols (or alkoxides). [Č in MeOH with MeOH/NaOMe gives (80% yield (11)) 1,2-diphenyl-1-methoxy-1,2-epoxyethane, b.p. 194–196° at 16 mm., accompanied by some cis + trans dibenzoylstilbene (see above).]

[Č in EtOH with EtOH/NaOEt gives similarly a prod., b.p. 188° at 12 mm., regarded (11) as 1,2-diphenyl-1-ethoxy-1,2-epoxypropane. — Note, however, that $\bar{\mathbb{C}}$ in EtOH/NaOEt or with alc. NaOH at 25° gives (5) cf. (1) benzoin (1:5210) and that under certain conditions an apparently intermediate benzoin diethylacetal $C_6H_5CH(OH).C(OC_2H_5)_2.-C_6H_5$, m.p. 66-67°, can be isolated (5).]

With phenols (or alkali phenates). [C with phenol + anhydrous K₂CO₃ in acetone refluxed 5 hrs. (20) or C with Na phenate (21) gives (59% yield (20)) desyl phenyl ether (the phenyl ether of benzoin), m.p. 85.5° (21), 85° (20); note that this prod. is isomeric with, but different from, ms-phenylbenzoin [Beil. VIII-211], whose m.p is almost the same; note also that desyl phenyl ether on attempted distillation at ord. press. undergoes a fission into phenol and a cpd. regarded (21) as 2,2,4,4-tetraphenylcyclobutanedione-1,3, m.p. 244-245°.]

With mercaptans. $[\bar{C} + \alpha$ -mercaptoacetic acid (thioglycolic acid) at 100° for 6 hrs. evolves HCl and yields (22) S-desylthioglycolic acid, m.p. 105° (corresp. oxime, m.p. 123°; corresp. semicarbazone, m.p. 178° (22)). — \bar{C} with β -mercaptopropionic acid at 100° for 6 hrs. evolves HCl and yields (16) β -(desylthio)propionic acid, m.p. 108-109°.]

[Č with thiophenol in EtOH/NaOEt gives in good yield (16) desyl phenyl sulfide, m.p. 83-84° (16), 81° (23). — Č in MeOH with aq. sodium thiosalicylate gives (22) S-desylthiosalicylic acid, m.p. 189°.]

Behavior with carbonyl compounds. [For behavior of \bar{C} with cyclohexanone + sodium in di-n-butyl ether see (24).]

Behavior with organic acids (or their salts). [\bar{C} with anhydrous NaOAc in excess Ac₂O refluxed 1 hr. yields (11) mainly the β -stereoisomer, m.p. 153°, of 1,2-diacetoxy-1,2-diphenylethylene [Beil. VI-1026, VI₁-(499)], accompanied by some of the more sol. α -stereoisomer, m.p. 118°.]

 $[\ddot{\mathbf{C}} + \mathbf{K}$ thiobenzoate in abs. alc. boiled 10 min. gives (100% yield (16)) desyl thiobenzoate, m.p. 110-112°.]

[C in aq. alc. KCN does not directly eliminate KCl and give the corresp. desyl cyanide

(ms-cyanodesoxybenzoin) [Beil. X-755, X_1 -(360)] which might be expected although this compd., m.p. 90-92° (25), 89-90° (26), is well known and preparable (yields 60% (25), 47% (26)) from benzyl cyanide + ethyl benzoate and otherwise. — Instead Č in aq. alc. KCN loses HCl and gives (27) (28) 1-cyano-1,2-diphenyl-1,2-epoxyethane (α -cyano- α , β -diphenyl-ethylene oxide) which obviously can exist in two geometrically stereoisomeric forms: one has m.p. 74° (27), 77-78° (28); the other has m.p. 52° (27); for much further detail especially with reference to further reactn. prods. of these epoxynitriles see (27) (28).

Behavior of \tilde{C} with RMgBr reactants. (See also above under behavior of \tilde{C} with hydrocarbons + AlCl₃.)

[\bar{C} with C_6H_6MgBr (2 moles) gives (29) (21) the prod. normally to be expected, viz., 1,1,2,2-tetraphenylethanol-1 [Beil. VI-732, VI₁-(364)], m.p. 236° (21) (30), 230.5° (29); the intermediate ketone, viz., ms-phenyldesoxybenzoin (for consts. see above reference) may sometimes (21) be formed, but for discussion of possible alternative mechanisms see (21) (29).]

Č with the three tolyl MgBr reactants has been studied, but the reaction is complex and shows no tendency to go way through to the expected tetraarylethanols (only one of which has been reported by any means). — [Č with o-tolyl MgBr (2 moles) gives (29) a mixt. of prods., including the expected intermediate ketone, viz, ms-(o-tolyl)desoxybenzoin, m.p. 56-57° (32); note, however, that the 1,2-diphenyl-1,2-di-(o-tolyl)ethanol-1 which should be the end prod. is unknown. — Č with m-tolyl MgBr gives (29) similarly a mixt. of prods. including the intermediate ketone, viz., ms-(m-tolyl)desoxybenzoin, m.p. 83-84° (32), 82.5-83.5° (29), 82-83° (33), but again the ultimate 1,2-diphenyl-1,2-di-(m-tolyl)ethanol-1 is unknown. — Č with p-tolyl MgBr (2 moles) gives (31) the ketone ms-(p-tolyl)desoxybenzoin, m.p. 97-98° (17), 96-97° (31); the ultimate 1,1-diphenyl-1,2-di-(p-tolyl)ethanol-1, m.p. 195-196°, has been obtd. by other means (29).]

Behavior of \bar{C} with amines. With primary amines. $[\bar{C}$ (1 mole) with aniline (2 moles) in alc. at room temp. for 24 hrs. gives (6) N-(desyl)aniline (benzoin anil =ms-anilinodesoxybenzoin) [Beil. XIV-103, XIV₁-(395)], mp. 99°; note that \bar{C} with aniline at 140–150° for 1hr. (34) ppts. aniline hydrochloride and leaves a mixt. contg. benzoin-anil = anilide (cf. (35)) since with benzaldehyde at 150-160° for 1 hr. under CO_2 it yields pentaphenyldihydroimidazole (34). — \bar{C} with p-toluidine in alc. at room temp. for 24 hrs. gives (3) similarly N-(desyl)-p-toluidine (ms-(p-toluidino)desoxybenzoin), m.p. 145°.]

[For corresp. reactns. of \bar{C} with *m*-chloroaniline, *p*-chloroaniline, *m*-bromoaniline, *p*-iodoaniline, *p*-aminophenol, *p*-phenetidine, *p*-aminoacetanilide, or ethyl *p*-aminobenzoate see (3); for study of rate of this group of reactns. see (4); note that o-toluidine, o-chloroaniline, and o-anisidine do not undergo this reactn. (3).]

With secondary amines. [C̄ with Me₂NH (2-3 moles) in alc. in s.t. at 100-110° gives (36) ms-(dimethylamino)desoxybenzoin, m.p. 59-61° (36).]

[\overline{C} (1 mole) with N-methylaniline (2 moles) in alc. refluxed $2\frac{1}{2}$ hrs. gives (47% yield (3)) ms-(N-methyl-N-phenylamino)desoxybenzoin, m.p. 100°; if reactants in alc. are stood at room temp. for 100 days, yield is 61% (3).]

[\bar{C} with piperidine at 100° for 20 min. gives (8) ms-(piperidino)desoxybenzoin [Beil. XX₁-(14)], m.p. 85–86° (8).]

With phenylhydrazine. C (1 mole) with phenylhydrazine (2 moles) in abs. alc. at room temp. for 3 days ppts. phenylhydrazine hydrochloride and yields (37) benzil bis-(phenylhydrazone) = benzil-phenylosazone, m.p. 233° dec. (37) [cf. under benzil (1:9015)].

N-Desylphthalimide [Beil. XXI-480, XXI₁-(374)]: pale yel. cryst. from AcOH. m.p. 157-158° (38), 155-156° (39). [From C with K phthalimide at 100° for 2 hrs, (24% yield (39)); note that C + potassium phthalimide in nitrobenzene at 150-160°

for 1½ hrs. gives a mixt. of N-desylphthalimide with the lower-melting stereoisomer of dibenzovlstilbene (1,2-dibenzovl-1,2-diphenylethylene) [Beil. VII-843, VII₁-(453)], m.p. 208° (39) (see also above).

3:1620 2,4,5-TRICHLOROPHENOL

$$\begin{array}{c|c} \text{OH} & \text{C}_6\text{H}_3\text{OCl}_3 & \text{Beil. VI} -\\ \text{Cl} & \text{VI}_1-\\ \text{VI}_{2^-}(180) \end{array}$$

Colorless ndls. from alc. or lgr. — Volatile with steam. — Sublimes.

[For prepn. of C from 1,2,4,5-tetrachlorobenzene (3:4115) with MeOH/NaOH in s.t. at 160° for 7 hrs. (yields: 85% (5), 80% (10)) (note that by this method \bar{C} is sometimes sole product (5), at others is accompanied (7) (10) by some of its methyl ether (2,4,5trichloroanisole) (see below)) see indic. refs.; from 2,4,5-trichloroaniline via diazotization in conc. H₂SO₄ as directed followed by htg. at 170-180° (65% yield (9)) see indic. refs.: from 2,4,5-trichloro-1-fluorobenzene with NaOMe see (6); from 3,5,6-trichloro-2-hydroxybenzoic acid by htg. with soda-lime at 185° see (3); from 2,4-dichloro-5-aminophenyl oamino-p-toluenesulfonate via diazotization, use of Cu₂Cl₂ reactn., and subsequent hydrolysis as directed see (4); from 2,5-dichlorophenol (3:1190) with Cl₂ in AcOH (9) or in AcOH + NaOAc (4) see indic. refs.l

 \bar{C} behaves as a weak monobasic acid (ioniz. const. at $25^{\circ} = 4.3 \times 10^{-8}$ (2)) but can be titrated with N/10 aq. NaOH; Neut. Eq. calcd. 197.5, found 197.1 (1). — C forms a spar. sol. K salt (4). — \bar{C} in toluene treated with MeOH/NaOH yields (11) anhydrous Na salt; from aq. this prod. cryst. as pentahydrate (12). — [For prepn. of Na, K, or Li salts see (12), of Ca or Ba salts see (13), of Zn salt see (14). — For use of these salts as fungicides see (11) (12) (13) (14) (15); for use of \bar{C} with triphenyl phosphate as wood preservative see (16).]

Č with Br₂ in AcOH (9) or with excess Br₂/aq. (17) yields 6-bromo-2,4,5-trichlorophenol, cryst. from AcOH or lt. pet., m.p. 81-82° (17), 81° (9) (corresp. benzoate, m.p. 116-117° (9)). — Č with Br₂ in pres. of Fe powder yields (9) 3,6-dibromo-2,4,5-trichlorophenol, ndls. from AcOH, m.p. 195° (9) (corresp benzoate, m.p. 176° (9)).

 \bar{C} treated below 10° with conc. HNO₃ (D=1.43) in AcOII gives (90% yield (5)) 6-nitro-2,4,5-trichlorophenol, pale yel. lfts. from lgr., m.p. 92-93° (5), 81° (9).

Č dislvd. in 20% NaOH refluxed with Me₂SO₄ gives (78.5% yield (5)) (9) corresp. methyl ether (2,4,5-trichloroanisole), ndls. from alc., m.p. 75° (5), 77.5° (9).

- ① 2,4,5-Trichlorophenyl benzoate: ndls. from alc, m.p. 92-93° (9), 91-92° (4), 89-90° (3). [From C in dil. alk. by shaking with benzoyl chloride (9).]
- ② 2,4,5-Trichlorophenoxyacetic acid: m.p. 153° (see 3:4335).

Ndls. from alc.; spar. sol. boilg. alc. (2). — Volatile with steam. — Sublimes.

 \bar{C} shows the double m.p. phenomena also exhibited by several of its isomers; if the fused \bar{C} in a m.p. tube is allowed to cool and then withdrawn from the bath it soon solidifies to a translucent mass which upon immediate reimmersion melts at 58°, but if left for a short time in the air it becomes opaque and then shows m.p. 68°; the translucent form rarely persists more than 20 min. (1).

[For prepn. of \bar{C} from 5,8-dichloronaphthylamine-2 [Beil. XII-1310] via diazotization and use of Cu_2Cl_2 reactn. see (4); for prepn. of \bar{C} from 1,6-dichloro-4-nitronaphthalene [Beil. V-556] (5) (2), from 4,6-dichloronaphthalenesulfonyl chloride-1 [Beil. XI-162] (6), from 4,7-dichloronaphthalenesulfonyl chloride-1 [Beil. XI-163] (7), from 1,4-dichloronaphthalenesulfonyl chloride-7 [Beil. XI-183] (8) (6), from 1-chloro-4-nitronaphthalene-

sulfonyl chloride-6 [Beil XI-189] (9), from 1-chloro-4-nitronaphthalenesulfonyl chloride-7 [Beil. XI-188] (9), from 1-chloronaphthalene-4,6-bis-(sulfonyl chloride) [Beil. XI-215] (3), or from 1-chloronaphthalene-4,7-bis-(sulfonyl chloride) [Beil. XI-214] (2), each with PCl₅ as directed, see indic. refs.]

[Č treated with ClSO₃H in CS₂ and reaction prod. converted to salts as directed (1) yields sodium 1,4,6-trichloronaphthalenesulfonate-X (corresp. sulfonyl chloride, m.p. 144° (1)).]

[C on oxidn. with dil. HNO₃ in s.t. at 150-160° for several days (8) yields a dichloro-nitro-phthalic acid not further characterized.]

[For sepn. of \bar{C} from mixts, with α -chloronaphthalene (3:6878) via sulfonation of the latter sec (11); for use of \bar{C} as wood impregnant see (12).]

[For prepn. of \bar{C} from 1-aminonaphthalenesulfonic acid-4 (naphthionic acid) [Beil. XIV-739, XIV₁-(732)] via convn. to diazonium salt and htg. with PCl₅ (13) in POCl₃ (7) (3) (6) see indic. refs.; from 1,4-dichloronaphthylamine-7 [Beil. XII-1310] via diazotization and reactn. with alc. see (14); for prepn. of \bar{C} from 4-chloronaphthalenesulfonyl chloride [Beil. XI-160] with PCl₅ (yields: 65–70% (5), 49% (4)) (15) (16) see indic. refs.; from K 4-bromonaphthalenesulfonate-1 [Beil. XI-164] (17), from naphthalene-1,4-bis-(sulfonyl chloride) [Beil. XI-212] (9), from 4-nitronaphthol-1 [Beil. VI-615] (18), from 1-chloro-4-nitronaphthalene [Beil. V-555, V₁-(264)] (18), with PCl₅ as directed see indic. refs.]

[For prepn. of \tilde{C} from naphthalene (1:7200) with SOCl₂ in s.t. at 170-180° (10), with 2 moles SO₂Cl₂ at 140-160° (19), with Cl₂ + FeCl₃ in CCl₄ at 0° (together with other products) (20), or with HOCl (8) see indic. refs.; from 1-chloronaphthalene (3:6878) with SO₂Cl₂ at 100-180° (21) or with Cl₂ (together with other products) (1) see indic. refs.; for formn.

of \bar{C} from naphthalene 1,2,3,4-tetrachloride (3:4750) on htg. at b.p. (22) or by actn. of alc. KOH (23) (24) (25) (26) (33).]

[\tilde{C} with benzoyl chloride (3:6240) + AlCl₃ in CS₂ yields (27) 1,4-dichloro-8-benzoyl-naphthalene, m.p. 104–105° (27), which with alc. gives (28) isoviolanthrone; for reactn. of \tilde{C} with phthalic anhydride see (29).]

[\bar{C} on mononitration with HNO₃ (D=1.45) yields (30) 1,4-dichloro-8-nitronaphthalene Beil. V-556, V-1(264)], m.p. 92° (30), 93° (31); note that the isomeric 1,4-dichloro-2-nitronaphthalene, m.p. 116.5°, has been obtd. only by indirect means (32).]

[Č on monosulfonation with fumg. H₂SO₄ at 160°, with sulfuric acid monohydrate at ord. temp. (34), or with ClSO₃H in CS₂ (33) yields 1,4-dichloronaphthalenesulfonic acid-6 [Beil. XI-183, XI₁-(41)] (corresp. sulfonyl chloride, m.p. 132° (33), corresp. sulfonamide, m.p. 244° (33)).]

 \bar{C} on oxidn. with boilg. dil. HNO₃ (D=1.3) yields (35) 3,6-dichlorophthalic acid (3:4870); \bar{C} on oxidn. with CrO₃/AcOH yields (36) 5,8-dichloronaphthoquinone-1,4 [Beil. VII-730], yel. ndls. from alc., m.p. 173-174° (36), together with 4,7-dichlorophthalide [Beil. XVII-312], m.p. 163° (36).

3:1670 3,5-DICHLOROPHENOL

Cryst. (from pet. eth. (1)). — Spar. sol. cold aq., fairly eas. sol. hot aq. (2). Volatile with steam (3). [For study of dissociation const. see (7).]

[For prepn. from 3,5-dichloroaniline [Beil. XII-626] via diazo reaction see (1) (2) (3) (4); for prepn. from 1,3,5-trinitrobenzene via 3-amino-5-chloroanisole see (5) or via 3,5-dichloroanisole see (6).]

 \bar{C} is readily nitrated; e.g., \bar{C} (16 g.) dislvd. in a soln. of NaNO₃ (12 g.) in aq. (180 ml.), treated during 1 hr. at 90–100° by grad. addn. of dil. H₂SO₄ (1:5; 48 ml.), htd. 2 hrs. then steam-distd., gave (3) in distillate 3,5-dichloro-2-nitrophenol (5 g.), lemon-yel. ndls. from pet. ether m.p. 51°, and by repeated hot dil. HCl extraction of tarry residue 3,5-dichloro-4-nitrophenol (6 g.) pale yel. ndls. from aq., m.p. 150° (3). [This latter product also results from the action of nitrous acid (3).]

C dislyd. in 4 pts. AcOH and treated with 3 pts. fumg. HNO₃ for ¾ hr. at 70° (2) gives (60% yield (2)) of 3,5-dichloro-2,4,6-trinitrophenol, pale yel. pr. from AcOH, m.p. 139-140° cor. (2).

C dislyd in 5 pts. AcOH gives with Br₂ (as specified (4)) 100% yield of 3,5-dichloro-2,4,6-tribromophenol, cryst. from AcOH, m.p. 189° (4).

C dislyd in aq. NaOH and shaken with (CH₃)₂SO₄ gives the methyl ether, 3,5-dichloroanisole, m.p. 39° (6). [The value of 68° given in Ref. 6, p. 104, is probably erroneous.]

- ① 3,5-Dichlorophenyl acetate: m.p. 38° (5).
- (5) 3.5-Dichlorophenyl benzoate: m.p. 55° (5).

3:1670 (1) Blanksma, Rec. trav. chim. 27, 29-30 (1908). (2) Willstatter, Schudel, Ber. 51, 784-787 (1918) (3) Hodgson, Wignall, J. Chem. Soc. 1927, 2217-2218. (4) Kohn, Pfeifer, Monatsh.

	66.7°	(15)		
	66-67° cor.	(16)		

Colorless cryst. from lgr. — Ndls. with 1 mole solvate from AcOH, latter lost over CaO (17).

 $\bar{\mathbf{C}}$ is almost insol. aq.: 1000 g. aq. at 11.2° dis. 0.51 g. $\bar{\mathbf{C}}$ {14}; at 25.4°, 0.858 g. $\bar{\mathbf{C}}$ {14}; at 96°, 2.43 g. $\bar{\mathbf{C}}$ {14}. — $\bar{\mathbf{C}}$ is volatile with steam, but not from alk. soln (difference and sepn. from o-chlorophenol (3:5980) or p-chlorophenol (3:0475) {18}). — $\bar{\mathbf{C}}$ is eas. sol. alc. or ether.

Binary systems contg. \bar{C} . — \bar{C} + nitrobenzene: this system forms a 1:1 molecular compound, m.p. 31°; this compd. forms with \bar{C} a cutectic, m p 28 7° contg. 65 wt. % \bar{C} , and with nitrobenzene a cutectic, m p. + 2.0° contg. 15 5 wt. % \bar{C} ; for data and f p./compn. diagram see (13). — \bar{C} + diphenylamine: for partial f p./compn. data and diag. see (19). — \bar{C} + 2,4,6-tribromophenol: for f.p./compn. data and diag. see (20). — \bar{C} + $\alpha,\alpha,\alpha,\alpha'$ -tetramethylphthalan: for study of this system see (15). — \bar{C} + 2,4,6-trinitroresorcinol (styphnic acid): forms no mol. cpd. but gives a cutectic, m.p. 60° contg. 91.8% \bar{C} (21).

PREPARATION OF C

From phenol. By direct action of chlorine. [For prepn. of \tilde{C} from phenol (1:1420) with Cl_2 see (3) (for very old initial work of (22) (12)); with Cl_2 + aq. alk. (i.e., with NaOCl) see (23) (16) (24).]

By indirect action of chlorine. [For prepn. of \bar{C} from phenol (1:1420) by chlorination with ethyl N,N-dichlorocarbamate (25), with N,N'-dichlorourea (26), with conc. HCl + 30% H₂O₂ (27), or with HCl + KClO₃ (28) (29) see indic. refs]

From other phenols or their relatives. [For formn. of \bar{C} from 2,4,6-trichloro-3-hydroxybenzaldehyde (6) by elimination of the aldehyde group with 50% aq. KOH at 60-70° for 4 hrs. (89.9% yield) see (6); from 2,4,6-trichloro-3-bromophenol (see below) or from 2,4,6-trichloro-3,5-dibromophenol (see below) by replacement of Br by H through use of Zn + AcOH see (9); from 2,4,6-tribromophenol [Beil. VI-203, VI₁-(107)] by replacement of all bromine by chlorine using Cl₂ in AcOH see (30).]

[For form. of \tilde{C} from phenol-p-sulfonic acid [Beil. XI-241, XI₁-(55)] (10) or its alkali salts (31) (32) in aq. soln. with Cl_2 (100% yield (10)) see indic. refs.; from aq p-hydroxyazobenzene [Beil. XVI-96, XVI₁-(233)] (75% yield (11)), from benzyl phenyl ether [Beil. YI-432, VI₁-(220)] (33), from o-hydroxybenzyl alcohol (saligenin) (1:1490) (34) with Cl_2 see indic. refs.; from dipotassium salt of salicylic acid (1:6780) with aq. KOCl (4 moles) see (8).

From other miscellaneous sources. [For formn. of \tilde{C} from aniline in HCl soln. with Cl₂ see (35); from 2,4,6-trichloroamline via diazotization and subsequent hydrolysis as directed see (7); from indigo [Beil. XXIV-417, XXIV₁-(370)] in aq. suspension with Cl₂ see (36) (37); from benzene (1:7400) with Cl₂O see (38); from 2,4,6-trichlorophenyl hypochlorite (see below) by warming with acids or alkalies see (75).]

USES OF C (OR ITS SALTS)

Although the topic cannot here be exhaustively pursued, the bactericidal, fungicidal, and general antiseptic action of \bar{C} or its salts has attracted much attention [for examples of useful articles in this general connection, see (39) (40) (41) (42) (43) (44) (45) (46); for patents on use of \bar{C} or its salts in the indicated fields see the following: for use of \bar{C} (with triaryl phosphates) as wood preservative (47), as preservative for glue (48), as insecticide and fungicide for board-like compns. from vegetable fibers (49), as bactericide (50) (51), as Na \bar{A} for anti-mildew treatment of textiles (52), as textile asst. in mercerization (53); for various complexes contg. \bar{C} and intended for use as insecticides, etc., see (54) (55) (56)].

CHEMICAL BEHAVIOR OF C

Reduction of \bar{C} . [The catalytic hydrogenation of \bar{C} apparently has not been extensively studied, but it is said (57) to be more stable toward $H_2 + PdCl_2$ than the corresponding 2,4,6-tribromophenol.]

Oxidation of \bar{C} . \bar{C} on oxidn. gives various products according to circumstances [e.g., \bar{C} in 2 N H₂SO₄ on electrolytic oxidn. gives (58) 2,6-dichlorohydroquinone (3:4600); \bar{C} on oxidn. with CrO₃/AcOH (59) (60) (61) (62) (63), with cold fumg. HNO₃ (12) (63), with HNO₃/H₂SO₄ (64), with NO + NO₂ in alc. (65) (66) or AcOH (61), or with PbO₂ in AcOH or C₆H₆ (61) gives (yields: 69% (59), 45% (60), 27% (61)) 2,6-dichlorobenzoquinone-1,4 (3:3750) (note that this product may be accompanied (61) by more or less 2-chloro-6-(2',4',6'-trichlorophenoxy)benzoquinone-1,4, m.p. 134-135°, and 2,6-bis-(2',4',6'-trichlorophenoxy)benzoquinone-1,4, m.p. 245°, which resemble the main prod. in appearance, composition, and behavior (61))].

[C on oxidn. with boilg. mixt. of conc. HNO₃ + HCl gives (16) 2,3,5-trichlorobenzoquinone-1,4 (3:4672).]

[\bar{C} on oxidn. with ClSO₃H (67), with Cl₂ + fumg. H₂SO₄ followed by ClSO₃H (68), with aqua regia (69) (70) (72), with HCl + KClO₃ (28) (16), with CrO₃/AcOH (71) or K₂Cr₂O₇/H₂SO₄ (71) gives (90% yield (68)) 2,3,5,6-tetrachlorobenzoquinone-1,4 (chloranil) (3:4978).]

[For study of oxidn. potential of C see (73).]

Nuclear substitution of \bar{C} . Chlorination. $[\bar{C}$ in HCl suspension with Cl₂ (74) or in AcOH soln. with Ca(OCl)₂ (75) gives 2,4,6-trichlorophenyl hypochlorite (2,4,4,6-tetrachlorocyclohexadien-2,5-one-1) [Beil. VII-147, VII₁-(96)], scales from ether/pet. ether, m.p. 122° (75) (10), 121-122° (76), 119° (74)]

[\tilde{C} with $Cl_2 + SbCl_5$ at not above 130° gives (77) 2,3,4,4,5,6-hexachlorocyclohexadien-2,5-one-1 ("hexachlorophenol") (3:3180), m.p. 107°.]

[$\bar{\mathbb{C}}$ with Cl_2 (3) in pres. of I_2 at 40° (78), or $\bar{\mathbb{C}}$ with Cl_2 in CCl_4 in pres. of FeCl₃ (79), or $\bar{\mathbb{C}}$ with Cl_2 in pres. of SbCl₃, I_2 , or FeCl₃ at 70–75° (80), gives 2,3,4,6-tetrachlorophenol (3:1687), m p. 69°.]

[C with Cl₂ in pres. of SbCl₃, I₂, or FeCl₃ at 135-140° gives (81) pentachlorophenol (3:4850), m.p. 190°.]

[C with FeCl₃ (no details) yields (14) 1,2,3,5-tetrachlorobenzene (3:0915), m.p. 51°.]

Bromination. [C with Br₂/aq. KBr soln. as directed (82) (83) gives a monobromo derivative of C frequently designated as "trichlorophenol bromide"; which of the three structures 4-bromo-2,4,6-trichlorocyclohexadien-2,5-one-1, or 2,4,6-trichlorophenyl hypobromite should be assigned to this prod. has never been decisively settled (83); however, on oxidn. with fumg. HNO₃ it gives (82) 2,6-dichlorobenzoquinone-1,4 (3:3750) and with cone. H₂SO₄ at 100° isomerizes (82) to 3-bromo-2,4,6-trichlorophenol, m.p. 73° (9) (corresp. benzoate, mp 117° (82))]

[C with Br₂ (large excess) + Fe powder at room temp. for 24 hrs. gives (100% yield (84)) cf. (85) 3,5-dibromo-2,4,6-trichlorophenol, cryst. from AcOH, m.p. 204° cor. (corresp. methyl ether, m.p. 127°; corresp. benzoate, m.p. 196° (84)).]

Nutration. [The direct nitration of \bar{C} has not been reported, presumably because nitration reagents readily oxidize free \bar{C} to 2,6-dichlorobenzoquinone-1,4 (3:3750) (see above under oxidn. of \bar{C}). — However, both possible nitration products have been obtained by indirect means: for 3-nitro-2,4,6-trichlorophenol, m.p. 71-72°, see (86); for 3,5-dinitro-2,4,6-trichlorophenol, m.p. 165-167°, see (87).]

Sulfonation. [C with fumg. H₂SO₄ (65% SO₃) at 50° gives (93% yield (88) 2,4,6-tri-chlorophenolsulfonic acid-3.]

Miscellaneous [Č with SCl₂ + AlCl₃ in CS₂ or CCl₄ gives (89) a product, m.p. 285°, which may be 3,3'-dihydroxy-2,4,6,2',4',6'-hexachlorodiphenyl sulfide]

Reactions of the phenolic group of C. (See also under O's below.)

Acidic character of \tilde{C} . \tilde{C} in aq. behaves as an acid and can be titrated with N/10 aq. NaOH (3); Neut. Eq. = 197 5. — [Data on dissoc. const. of \tilde{C} include the following: in aq. at 25° 1.0×10^{-7} (90), 3.9×10^{-7} (2) cf. (91) (92). — For study of acid strength of \tilde{C} in formamide see (93). — For study of exchange reaction of \tilde{C} with heavy water see (94).]

Salts of \bar{C} . [NH₄ \bar{A} : spar. sol. cold aq., eas. sol. hot aq. (22), somewhat spar. sol. alc. (24); loses NH₃ in air (12). — K \bar{A} , ½H₂O: (24) (12). — Na \bar{A} : prepn. (95), behavior with I₂ in various solvents (95) (96), behavior with chloroacetone (3:5425) giving acctonyl 2,4,6-trichlorophenyl ether, m.p. 75° (96).]

 $Mg\bar{A}.2H_2O$: eas. sol. aq. (12). — $Ba\bar{A}_2.4H_2O$: spar. sol. aq. (12). — $Pb\bar{A}_2$ (12).

AgA.H₂O: yellow (97) [study of decompositions (98) (96) (99)].

Etherification of \bar{C} . (See also below under \mathbb{O} 's.)

[\bar{C} with 1,2-dibromoethane (ethylene dibromide) in alk. soln. gives (100) β -bromoethyl 2,4,6-trichlorophenyl ether, m.p. 47–48°. — \bar{C} with ethylene oxide (1:6105) in alc. NaOEt gives (101) β -hydroxyethyl 2,4,6-trichlorophenyl ether, m.p. 77° (101) (for study of rate of this reaction see (102)). — \bar{C} (as Na \bar{A}) with benz-o-chlorophenylimino-chloride gives (103) N-(o-chlorophenyl)benzimino 2,4,6-trichlorophenyl ether, m.p. 99–100°, which at 250–270° for 2 hrs. rearr. (103) to the N-benzoyl derivative (m.p. 131–132°) of 2,4,6,2'-tetrachloro-diphenylamine. — \bar{C} with 2,4,6-trichlorobenzyl chloride + NaOH gives (104) 2,4,6-trichlorobenzyl 2,4,6-trichlorophenyl ether, m.p. 101–103°.]

Esterification of \bar{C} . (See also below under \mathbb{D} 's.)

- [\bar{C} with SOCl₂ in pyridine + C₆H₆ gives (4) bis-(2,4,6-trichlorophenyl) sulfite, cryst. from C₆H₆, m p. 87-88°; note, however, that this prod. is unstable and even within a few hours reverts to \bar{C} .]
- [\bar{C} with PCl₅ in C₆H₆ gives (105) bis-(2,4,6-trichloropnenoxy)phosphoryl chloride, (C₆H₂OCl₃)P(O)Cl, cryst. from C₆H₆, m.p. 126-129° (105). (Note that \bar{C} with PCl₅ in s.t. at 200-300° gives also (106) some 1,2,3,5-tetrachlorobenzene (3:0915).) \bar{C} (3 moles) with POCl₃ (1 mole) refluxed several days gives (107) tris-(2,4,6-trichlorophenyl) phosphate, m.p. 201° (107).]
- [\overline{C} (2 moles) with COCl₂ (3:5000) in aq. alk. gives (108) bis-(2,4,6-trichlorophenyl) carbonate, m.p. 153-154° (109).]
 - ② 2,4,6-Trichlorophenyl methyl ether (2,4,6-trichloroanisole) [Beil. VI-192]: cryst. from alc., m.p. 61-62° (9), 60° (110) (111), 59.5° (112); b.p. 240° cor. at 738 mm. (110) cf. (87). [From C with Me₂SO₄ + 15% KOH (87); for crystallographic data see (82); for attempted cleavage with pyridine or piperidine see (113); for nitration see (87).]
 - 2,4,6-Trichlorophenyl ethyl ether (2,4,6-trichlorophenetole) [Beil. VI-192, VI₁-(104)]:
 m.p. 43-44° (12), b.p. 246° (12). [From K\(\bar{A}\) + EtI (12) or from Ag\(\bar{A}\) + EtI (98).]
 - —— 2,4,6-Trichlorophenyl acetate: oil, b.p. 261-262° (114). [From C with AcCl (114).] D 2,4,6-Trichlorophenyl benzoate [Beil. IX-117]: m.p. 75.5° (9). 74° (115), 73-74° (6),
 - (115), 73-74 (15), 73-74 (15), 70° (14). [From C with benzoyl chloride (3:6240) in pres. of aq. NaOH (115) (9); for study of rate of benzoylation of C at 25° and 85° see (116).]
 - ---- 2,4,6-Trichlorophenyl o-nitrobenzoate: unreported.
 - 2,4,6-Trichlorophenyl m-nitrobenzoate: unreported.
 - 2,4,6-Trichlorophenyl p-nitrobenzoate: m.p. 106° (115).
 - ---- 2,4,6-Trichlorophenyl 3,5-dinitrobenzoate: unreported.
 - **D 2,4,6-Trichlorophenyl benzenesulfonate:** m.p. 66° (117). [From C with benzenesulfonyl chloride in aq. alk. (117).]
 - D 2,4,6-Trichlorophenyl o-nitrobenzenesulfonate: m.p 142° (118). [From $\ddot{\textbf{C}}$ with o-nitrobenzenesulfonyl chloride + $\textbf{K}_2\textbf{CO}_3$ in acetone (118)]
 - 2.4.6-Trichlorophenyl p-toluenesulfonate: unreported.
 - --- 2,4,6-Trichlorophenyl phenyl ether: unreported.
 - 2,4,6-Trichlorophenyl 2,4-dinitrophenyl ether: m.p. 136° (119). [From C with 2,4-dinitrochlorobenzene in alc. alk. (119).]
 - ---- 2,4,6-Trichlorophenyl benzyl ether: unreported.
 - 2,4,6-Trichlorophenyl p-nitrobenzyl ether: unreported.
 - 2,4,6-Trichlorophenoxyacetic acid: m.p. 177° (120).
 - 2,4,6-Trichlorophenyl N-phenylcarbamate: unreported.
 - D 2,4,6-Trichlorophenyl N-(p-bromophenyl)carbamate: pl. from C₆H₆ + EtOAc, m.p. 162-164° cor. (121). [From C with p-bromobenzazide (121) in lgr. (121).]
 - **D** 2,4,6-Trichlorophenyl N-(p-iodophenyl)carbamate: m.p. 172-173° (122). [From \bar{C} with p-iodobenzazide (122) in lgr. (122).]

- **D 2,4,6-Trichlorophenyl** N-(m-nitrophenyl)carbamate: white rods from lgr., m.p. 165-167° u.c.; 169-170° cor. (123). [From \bar{C} with m-nitrobenzazide (123) in lgr. (123).]
- **② 2,4,6-Trichlorophenyl** N-(p-nitrophenyl) carbamate: pale yel. rods from lgr., m.p. 166° cor. (124). [From \bar{C} with p-nitrobenzazide (124) in lgr. (124).]
- ---- 2,4,6-Trichlorophenyl N-(3,5-dinitrophenyl)carbamate: unreported.
- Q 2,4,6-Trichlorophenyl N-(3,5-dinitro-4-methylphenyl)carbamate: yel. pr. from lgr. or EtOAc, m.p. 195-196° u.c., 201-202° cor. (125). [From C with 3,5-dinitro-4-methylbenzazide (125) in lgr. (125)]
- **2.4.6-Trichlorophenyl** $N-(\alpha-naphthyl)$ carbamate: unreported.
- **D 2,4,6-Trichlorophenyl** $N-(\beta-\text{naphthyl})$ carbamate: pr. from lgr., m.p. 157-158° u.c., 161-162° cor. (126). [From \bar{C} with β -naphthyl isocyanate (126) or β -naphthazide (126) in lgr. (126)]
- **D 2,4,6-Trichlorophenyl** N,N-diphenylcarbamate: m.p. 143° (127). [From $\bar{\mathbf{C}}$ with N,N-diphenylcarbamyl chloride (127).]

Beil. II - 210

II1--

 Π_2 —

3:1676 DECACHLORODIETHYL ETHER

(bis-(Pentachloroethyl) ether; Cl₃C
"Perchloroether")

M.P. 69° (1)

 $D_{-}^{14.5} = 1.900 (2)$

[For crystallog. data see (3).]

[For prepn. of C from abs. diethyl ether (1:6110) with excess dry Cl₂ in direct sunlight see (1).]

 $\bar{\mathbf{C}}$ on boilg. decomposes (2) into trichloroacetyl chloride (3:5420) and hexachloroethane (3:4835).

 \bar{C} with conc. H₂SO₄ at 240° is slowly attacked yielding (2) trichloroacetyl chloride (3:5420).

C with alc. K₂S loses 2 atoms of chlorine yielding (2) di-(trichlorovinyl) ether (3:6373).

Č with metallic potassium on htg. detonates; in this behavior Č behaves toward alkali metals like many other highly halogenated compounds.

Note that all these data on \bar{C} are very old; no later studies of \bar{C} are reported in the literature.

3:1676 (1) Regnault, Ann. 34, 27-29 (1840). (2) Malaguti, Ann. chim. (3) 16, 13-28 (1846). (3) Nickles, Ann. chim. (3) 22, 29 (1848).

3:1685 CHLOROPROPIOLIC ACID Cl.C=C.COOH C3HO2Cl

Beil. II - 478 II₁---

 II_{2} -(451)

M.P. 69-70° (1)

Colorless cryst. from pet. eth.; eas. sol. ether; eas. vol. (even in desiccator). Very irritating and poisonous; salts extremely toxic (1). — Stable in dry state at room temperature.

[For prepn. from propiolic ac. [Beil. II-477] by actn. of KOH/KOCl soln. at 0° see (1) (2).]

 $\ddot{\mathbf{C}}$ on htg. with Ba(OH)₂ soln. yields chloroacetylene (3:7000) + BaCO₃ while acidification and ether extraction of the aq. layer yields malonic ac. (1:0480), m.p. 133-134° (1). [An alk, soln. of $\ddot{\mathbf{C}}$ on stdg. is also partly converted to malonic ac. (1).]

3:1685 (1) Straus, Kollek, Heyn, *Ber* **63**, 1876–1877 (1930). **(2)** Brit. 333,946, Sept. 18, 1930; *Cent.* **1931**, I 523.

3:1687 2.3.4.6-TETRACHLOROPHENOL

 $\begin{array}{cccc} \text{OH} & \mathrm{C_6H_2OCl_4} & \text{Beil. VI - 193} \\ & & & & & & & \\ \mathrm{Cl} & & & & & & \\ \mathrm{Cl} & & & & & & \\ \mathrm{Cl} & & & & & & \\ \end{array}$

M.P.	70°	(1) (2) (3)	B.P.	164°	at 23 mm. (4)
	69-70°	(4)		160.5°	at 21 mm. (4)
	68-69°	(5) (6)		159°	at 20 mm. (4)
	67.5-68°	(7)		157°	at 19 mm. (4)
	67-69°	(8)		155°	at 18 mm. (4)
	67-68°	(9)		152.5°	at 17 mm. (4)
	67°	(10) (11)		150°	at 16 mm. (4)
	65.5°	(12)			
	65–66°	(13)			

Ndls. from lgr., AcOH, or ether. — Almost insol. cold aq.; spar. sol. hot aq.; but volatile with steam. — Eas. sol. alc., C_6H_6 , $CHCl_3$, CS_2 , lgr.; fairly sol. hot pet. eth. — Odorless at ord. temp.

PREPARATION OF C

[For prepn. of \bar{C} from phenol (1:1420) with Cl₂ at 80° for 14 days (7) or with Cl₂ in pres. of 2-3% I₂ or 4-5% SbCl₃ or 5-6% FeCl₃ for shorter periods (7), from sodium phenolate with SO₂Cl₂ (13), or from 2,4,6-trichlorophenol (3:1673) with Cl₂ (1) in pres. of I₂ at 40° (8) or with Cl₂ in CCl₄ soln. in pres. of FeCl₃ (14), see indic. refs.]

[For form. of \tilde{C} from 3,5,6-trichloro-2-hydroxybenzoic acid (3,5,6-trichlorosalicylic acid) (5) with Cl₂ in 30% AcOH see (5); from 2,4,5,6-tetrachloro-3-hydroxybenzoic acid [Beil. X-144] (11) by htg. with lime see (11); from 2,4,5,6-tetrachloro-3-hydroxybenzalde-hyde (6) with 50% aq. KOH at 100° for 2 hrs. (the CO group being eliminated as K formate) see (6); from o-(2,4,5,6-tetrachloro-3-hydroxybenzoyl)benzoic acid (3) by cleavage with conc. H₂SO₄ see (3).]

[For formn. of C from 1,2,4,4,5,6,6-heptachlorocyclohexen-1-one-3 [Beil. VII-51] by reduction with SnCl₂/HCl/AcOH (4) or with KI/AcOH or Na₂SO₃/AcOH see (12); from "6-hydroxyphenylene diazosulfide" with Cl₂ in AcOH followed by reduction with SnCl₂ see (10).]

USES OF C (OR ITS SALTS)

[For patents on use of \bar{C} (or its salts) as bactericide (15) (16) in preservation of rubber latex (17), as insecticide (18), or in triphenyl phosphate as wood preservative (19) see indic. refs.]

[For general articles on \bar{C} (or its salts) as bactericides (20), fungicides (21) (27) for paint (22) or leather (23) (24) (25) (26), or in preservation of brine samples for analysis (28) see indic. refs.]

PHYSIOLOGICAL EFFECTS OF C (OR ITS SALTS)

[For studies on dermatitis from \bar{C} or its salts see (29) (30); for report on toxicity of \bar{C} in leather see (31).]

CHEMICAL BEHAVIOR OF C

Action of chlorine. [C with Cl₂ in AcOH gives (4) (12) 1,2,4,4,5,6,6-heptachlorocyclo-hexen-1-one-3 [Beil. VII-51].]

Action of bromine. \ddot{C} with Br₂ (1 mole) in pres. of Fe powder gives (8) 5-bromo-2,3,4,6-tetrachlorophenol [Beil. VI₁-(106)], cryst. from AcOH, m.p. 197° (8) (32), 192° (33) (corresp. acetyl deriv., m.p. 144° (33); corresp. benzoyl deriv., m.p. 169° (33)).

Action of nitric acid. [C with fumg. HNO₃ (5 wt. parts) is oxidized (70% yield (4)) (12) to 2,3,5-trichlorobenzoquinone-1,4 (3:4672). — Note, however, that the mononitro deriv. of C, viz., 5-nitro-2,3,4,6-tetrachlorophenol, ndls. from C₆H₆, m.p. 122°, has been obtd. (8) by HBr cleavage of the corresp. methyl ether (see below).]

Behavior of \bar{C} as an acid. \bar{C} in aq. behaves as an acid, K at $25^{\circ} = 4.2 \times 10^{-6}$ (2) cf. (34), and can be titrated with N/10 aq. NaOH (1); Neut. Eq. = 232. — [For prepn. of alk. salts of \bar{C} by neutralization in mixtures of org. solvents see (35); for uses of salts of \bar{C} see above.]

Miscellaneous reactions of C. [C (as KA) in conc. aq. soln. with COCl₂ (3:5000) in toluene gives (36) bis-(2,3,4,6-tetrachlorophenyl) carbonate, m.p. 155-156° (36).]

- ② 2,3,4,6-Tetrachlorophenyl methyl ether (2,3,4,6-tetrachloroanisole): ndls. from MeOH, m.p. 64-65° (4), 60° (8), b.p. 266-270° u.c. at 244 mm. (8). [From C with MeI in MeOH/NaOMe soln. (4) cf. (8).— Note that this prod. on nitration with 7-8 wt. pts. fumg. HNO₃ gives 5-nitro-2,3,4,6-tetrachloroanisole, m p. 58° (8).]
- 2,3,4,6-Tetrachlorophenyl ethyl ether (2,3,4,6-tetrachlorophenetole): ndls. from alc.,
 m.p. 59-60° (4), 55° (6). [From C with EtI in EtOH/NaOEt soln. (4); also indirectly (6).]
- D 2,3,4,6-Tetrachlorophenyl acetate: cryst. from alc., m.p. 66° (5), 65-66° (4), 59° (12). [From C with Accol (4) or with Accol (12).]
- **D** 2,3,4,6-Tetrachlorophenyl N-phenylcarbamate: ndls. from alc., m.p. 141-142° (4). [From \tilde{C} with phenyl isocyanate in C_6H_6 24 hrs. at room temp. (4)]

3:1690 2,6-DICHLOROBENZALDEHYDE $C_7H_4OCl_2$ Beil.

$$C_7H_4OCl_2$$

$$Cl$$

$$CHO$$

$$CHO$$

$$C_1$$

$$Reil. VII - 237$$

$$VII_1-(134)$$

M.P. 71° (1) 70-71° (2) 70° (3) 69-70° (4) (5) Colorless cryst. from pet. ether (b.p. 40-60°) or lgr.

[For prepn. of \bar{C} from 2,6-dichlorotoluene (3:6270) by oxidn. with MnO₂ + H₂SO₄ see (2); for prepn. of \bar{C} from 2,6-dichlorobenzaldehyde diethylacetal (see below) by hydrolysis on shaking with dil. HCl see (6).]

[Č on reduction would presumably yield 2,6-dichlorobenzyl alc., but this prod. is unreported in the literature.]

 \bar{C} in alk. suspension on oxidn. with air gives (7) 2,6-dichlorobenzoic acid (3:4200), m.p. 144° .

[\bar{C} (fused) with Cl₂ in brilliant artificial light gives (58% yield (8)) 2,6-dichlorobenzoyl chloride, b.p. 126-128° at 18 mm. — \bar{C} with PCl₅ at 160° gives (90% yield (9)) (4) (5) 2,6-dichlorobenzal (di)chloride (3:9398) oil, b.p. 124-126° at 16 mm. (9), accompanied in some preparations (4) (5) by some bis-(α ,2,6-trichlorobenzyl) ether, m.p. 180-185° (4) (5).]

[\bar{C} with alkali sulfite (1 mole) under press, reacts at one of the two halogen atoms giving (2) 6-chlorobenzaldehydesulfonic acid-2 [Beil. XI-324] — \bar{C} with alkali sulfite (2 moles) under press, gives (2) benzaldehyde disulfonic acid-2,6 [Beil. XI-326].]

 \bar{C} disslvd. in 7–8 wt. pts cone. H₂SO₄, and at 10–15° mononitrated with a mixt. of fumg. HNO₃ + cone. H₂SO₄, poured into aq. gives (yield not stated (10)) (2) 2,6-dichloro-3-nitrobenzaldehyde [Beil. VII-263], pl. from CS₂ (10) or lfts from C₆H₆ (2), m p. 76° (10), 76–77° (2) (corresp. α-oxime, m p. 156–157° (10), β-oxime, m p. 154–155° (10); note that a mixt of the two oximes melts 128–130° (10)) — [Note that no dintro-2,6-dichlorobenzaldehyde has been reported; also that the mp.'s of certain of the isomeric mononitrodichlorobenzaldehydes are very close to the above mononitration prod.: e g., 2,4-dichloro-6-nitrobenzaldehyde (from 2,4-dichlorobenzaldehyde 3:1800) has m.p. 74–75°; 2,5-dichloro-3-nitrobenzaldehyde (from 2,5-dichlorobenzaldehyde 3:1145) has m.p. 66.5–67°; 3,4-dichloro-6-nitrobenzaldehyde (from 3,4-dichlorobenzaldehyde 3:0550) has m.p. 73°.]

[C on sulfonation gives (2) 2,6-dichlorobenzaldchydesulfonic acid-3 [Beil XI-325].]

[\bar{C} with 50% KOH at 100° for 5 hrs. under N₂ undergoes cleavage of the aldehyde group giving (84% yield (11)) *m*-dichlorobenzene (3:5960) q.v. and the corresp. K formate.]

 $[\bar{C}]$ with aq. alc. hydrazine sulfate gives (86% yield (18)) 2,6-dichlorobenzaldazine, m.p. 153° cor.; but this prod or \bar{C} with hydrazine hydrate refluxed 5 hrs. gives 2,6-dichlorobenzaldehyde hydrazone, m.p. 134°, which by Wolff-Kishner reduction gives (80% yield (18)) 2,6-dichlorotoluene (3:6270).]

[\tilde{C} with EtOH contg. 1½ wt. % dry HCl refluxed 24 hrs. gives (13.6% yield (6)) 2,6-dichlorobenzaldehyde dicthylacetal, oil, b.p. 142-144° at 10 mm., m.p. -1° (6); this prod. with dil HCl readily hydrolyzes back to \tilde{C} + EtOH.]

[\bar{C} with β -naphthol (2 moles) in AcOH with 30% HBr in AcOH at 100° for 2 hrs. or at room temp. for 24 hrs. condenses and ring-closes giving (88% yield (8)) 9-(2,6-dichlorophenyl)-1,2,7,8-dibenzoxanthane ($C_{27}H_{16}OCl_2$), cryst. from lgr., m.p. 264-265° (8). — Note that \bar{C} with β -thionaphthol (2 moles) under similar conditions yields a prod. $C_{27}H_{18}S_2Cl_2$, of unknown structure.]

 \bar{C} with anhydrous NaOAe + Ac₂O in Perkin synthesis (12) (13) (1), or \bar{C} with malonic acid in AcOH (13) gives (yields: 81-83% (12), 80% (1), 18% (13)) 2,6-dichlorocinnamic acid [Beil. IX₁-(239)], cryst. from AcOH, m.p. 196° (12), 193° (13), 183° (1); note that in this reaction some 2,6-dichlorobenzal diacetate [Beil. VII₁-(134)], ndls. from lgr., m.p. 85° (1), is sometimes formed.

C appears to behave normally with RMgX reactants [e.g., C with MeMgI in dry ether followed by usual hydrolysis gives (68.6% yield (14)) 2,6-dichlorophenyl-methyl-carbinol,

m.p. 34-35°, b.p. 137-138° at 17 mm., 134-136° at 13 mm. (corresp. benzoate, m.p. 77°); \tilde{C} with C_6H_6MgBr similarly gives in good yield (1) 2,6-dichlorophenyl-phenyl-carbinol, m.p. 57° (corresp. acetate, m.p. 105°)]. [For conversion of \tilde{C} to 2,6-dichlorostyrene (16) (17) via formn. of 2,6-dichlorophenyl-methyl-carbinol (above) and dehydration of latter with KHSO₄ (31.5% yield (16)) see indic. refs]

Č with aniline readily condenses yielding (1) 2,6-dichlorobenzaldehyde anil, m.p. 64-65°.

- **② 2,6-Dichlorobenzaldoxime:** colorless ndls. from C_6H_6 (10) or lgr. (1), m.p. $149-150^\circ$ (10), $146-147^\circ$ (1). [From \tilde{C} with NH₂OH.HCl + Na₂CO₃ in dil. alc. at 100° for 5 hrs. (10) cf. (1); with cold Ac₂O this prod. gives an acetyl deriv., m.p. 51° (10); with boilg. Ac₂O for 5 min. the oxime loses H₂O giving (1) 2,6-dichlorobenzonitrile [Beil. IX-343, IX₁-(141)], ndls. from lgr. or by sublimation, m.p. 143° (1), $144.5-146.5^\circ$ (15).]
- ---- 2,6-Dichlorobenzaldehyde phenylhydrazone: unreported.
- --- 2,6-Dichlorobenzaldehyde o-nitrophenylhydrazone: m p. 154° (1).
- --- 2,6-Dichlorobenzaldehyde p-nitrophenylhydrazone: unreported.
- ---- 2,6-Dichlorobenzaldehyde 2,4-dinitrophenylhydrazone: unreported.
- ---- 2,6-Dichlorobenzaldehyde p-bromophenylhydrazone: m.p. 142° (1).
- --- 2,6-Dichlorobenzaldehyde semicarbazone: unreported.

Ndls. from hot aq., ndls. from lgr., pr. from CHCl₃; eas. sol. alc., AcOH, C₆H₆, CHCl₃, boilg. lgr. — For crystallographic constants see (4). — Volatile with steam.

[For prepn. of \bar{C} from β -naphthol (1:1540) with Cl_2 in AcOH (80% yield (21)) (3) (4) (6), with SO_2Cl_2 in CS_2 (7) or with $C_6H_5ICl_2$ (84% yield (2)) see indic. refs.; from sodium β -naphtholate in CS_2 suspension on treatment with Cl_2 (8) or in cold aq. with NaOCl (84% yield (5)) (9) see indic. refs.; for formn. of \bar{C} from β -naphthol (1:1540) as by-prod. of its

oxidn. with FeCl₃ to β -dinaphthol (2,2'-dihydroxybinaphthyl-1,1') see (10) (11) (the proportion of \bar{C} increases with increasing acidity (11)); for formn. of \bar{C} from β -naphthol as by-prod. of react. with SeOCl₂ see (20).]

 \bar{C} with 1 mole Cl_2 in AcOH soln. gives (12) 1,6-dichloronaphthol-2 (3:3600), m.p. 119.5° (12); \bar{C} with 1 mole Br_2 yields (7) (13) 6-bromo-2-chloronaphthol-2 [Beil. VI-651], ndls. from AcOH with 1 mole solvent, m p. 92°, anhydrous ndls. by sublimation, m.p. 101° (7). [Note, however, that \bar{C} in AcOH + NaOAc with 1 mole Br_2 yields (1) "1-bromo-1-chloro-2-oxonaphthalenedihydride-1,2," pale yel. pr. from lgr., m.p. 90° when pure but on short stdg. soon becoming lower.]

[$\bar{\mathbf{C}}$ in AcOH with conc. HI (D=1.5) boiled 5 hrs. gives (79% yield (5)) β -naphthol (1:1540), m.p. 121° (5); note, however, that $\bar{\mathbf{C}}$ is unaffected by SnCl₂ either in acid or alk. even after protracted refluxing, but in AcOH/HCl in s.t. 8 hrs. at 100° (1) reduces to β -naphthol.]

[C in alk. soln. treated with p-nitrobenzenediazonium chloride soln. loses its halogen atom and yields (14) (15) (16) cf. (21) 1-(p-nitrobenzeneazo)naphthol-2 ("Para Red") [Beil. XVI-165, XVI₁-(255)], red ndls. from pyridine, m.p. 246-247° u.c. (14), from AcOH, m.p. 250° cor. (15). (Note, however, that as much as 40% of a light yel. by-prod., m.p. 125° dec., is also formed (16).)]

[\bar{C} melted with PCl₅ and then treated with aq. (4), or \bar{C} in alk. soln. shaken with POCl₃ (17), or sodium salt of \bar{C} shaken in xylene with POCl₃ (18), yields *tris*-(1-chloronaphthyl-2) phosphate, ndls. from alc., m.p. 152° (4) (note that by the second method (above) *bis*-(1-chloronaphthyl-2) phosphoric acid, ndls. from alc. + HCl, m.p. 251° (4), is also formed (4)).]

[Č (2 moles) with Na₂S (1 mole) htd. in aq. under N₂ gives (97.5% yield (19)) bis-(2-hydroxynaphthyl-1) sulfide [Beil. VI-976, Vl₁-(470)], colorless cryst. from AcOH, m.p. 226° cor. (19).]

[C on refluxing a few hrs. with aniline (best under N₂ (23)) yields (22) 1-anilinonaphthol-2 [Beil. XIII-678], ndls. from lgr., m.p. 153-154° (22), 155-156° (23); for corresp. reactn. with many other monamines (22) (23) and diamines (24) see indic. refs.]

Č under many circumstances yields ethers with difficulty and small yields; e.g., Č with MeOH + conc. H₂SO₄ (25) or p-toluenesulfonic acid (26) gives only 2-7% methyl ether; however, Č in MeOH/KOH htd. with MeI in s.t. at 100° for 5 hrs. (25), or Č in 15% KOH shaken with Me₂SO₄ for ½ hr. (91% yield (5)), gives 1-chloro-2-methoxynaphthalene, pr. from alc., m.p. 70-71° (5), 68° (25), 78° (27); this methyl ether on protracted htg. with conc. HCl in s.t. at 200-250° yields Č + MeCl (17) (27). — Č with EtOH + conc. H₂SO₄ (25) gives only 0.5-10% ethyl ether, but Č with EtOH/KOH + EtBr htd. 3 hrs. at 100° (25) gives 1-chloro-2-ethoxynaphthalene, lfts. from alc., m.p. 58° (25).

- ① 1-Chloro-2-naphthyl acetate: tbls. from alc., m.p. 42-43° (3). [From C with AcCl (3).]
- ① 1-Chloro-2-naphthyl benzoate: lfts. from alc., m.p. 101° (27). [From C in alk. soln. by shaking with BzCl (27).]

M.P. 71.5-72° (1) B.P. 235-236° (1)

 \bar{C} is volatile with steam. — The products of m.p. 45-46° (2) and m.p. 58° (3) formerly supposed to have been \bar{C} are now regarded (1) as 2,4,6-trichloro-3-methylphenol (3:0618) and 2,4-dichloro-3-methylphenol (3:1205) respectively

[For prepn. of \bar{C} from 6-amino-4-chloro-3-methylphenol (1) via diazotization and use of Cu_2Cl_2 reaction see (1); from 4,6-diamino-3-methylphenol (1) via tetrazotization and use of Cu_2Cl_2 reaction see (1); for formn. of \bar{C} (together with other isomers) from 4-chloro-3-methylphenol (3:1535) or from 6-chloro-3-methylphenol (3:0700) in CHCl₃ with Cl_2 (1 mole) see (1).]

 \bar{C} in CHCl₃ with 1 mole Cl₂ gives alm. quant. yields (1) 2,4,6-trichloro-3-methylphenol (3:0618), m.p. 46° (1).

- 4,6-Dichloro-3-methylphenyl benzoate: mats of very fine ndls. from alc., m.p. 57.5°
 (1). [From C with BzCl in pyridine (1)]
- **4.6-Dichloro-3-methylphenyl benzenesulfonate:** thin lustrous plates from alc., m.p. 86° (1). [From \tilde{C} + benzenesulfonyl chloride in pyridine (1).]
- **4.6-Dichloro-3-methylphenyl** p-toluenesulfonate: very fine ndls. from alc., m.p. $104-105^{\circ}$ (1). [From $\tilde{C} + p$ -toluenesulfonyl chloride in pyridine (1).]

3:1745 (1) Huston, Chen, J. Am. Chem. Soc. 55, 4216-4218 (1933). (2) von Walther, Zipper, J. prakt. Chem. (2) 91, 374 (1864). (3) Tanaka, Morikowa, Sakamoto, J. Chem. Soc. Japan 51, 275-277 (1930); C.A. 26, 706-707 (1932).

72° (2) 71° (4) Ndls. from lt. pet. - Volatile with steam.

[For prepn. of \bar{C} from 6-amino-3,4-dimethylphenol (5-amino-o-4-xylenol) [Beil. XIII-629, XIII₁-(244)] (1) via diazotization and use of Cu₂Cl₂ reaction (yield not stated) see (1); from 3,4-dimethylphenol (o-4-xylenol) (1.1453) with SO₂Cl₂ in CHCl₃ (23% yield) see (4) cf. (2) (3).]

[For studies on bactericidal action of C see (2) (3).]

C with Cl2 does not (1) give a trichloro derivative.

Č with HNO₃ in AcOH soln, as directed gives (5) 2-nitro-6-chloro-3,4-dimethylphenol (5-chloro-3-nitro-o-4-xylenol), yel. pl. from C₆H₆, m.p. 127.5° (5); note, however, that neither the isomeric mononitro deriv. nor the corresp. dinitro deriv. is known.

C does not (5) couple with benzenediazonium chloride.

[For behavior of \bar{C} with sulfur chloride + AlCl₃ in CS₂ see (6).]

- —— 6-Chloro-3,4-dimethylphenyl acetate: unreported.

 ① 6-Chloro-3,4-dimethylphenyl benzoate: m.p. 43° (1).
- 3:1754 (1) Hinkel, Collins, Ayling, J. Chem. Soc. 123, 2973 (1923). (2) Heicken, Angew. Chem. 52, 263-265 (1939). (3) Lockemann, Kunzmann, Angew Chem. 46, 296-301 (1933). (4) McClement, Smiles, J. Chem. Soc. 1937, 1019. (5) Hinkel, Ayling, Bevan, J. Chem. Soc. 1928, 2530-2531. (6) Dvorkovitz, Smiles, J. Chem. Soc. 1938, 2026.

[See also 4-chloro-2-phenylphenol (3:8980).]

Important Note. Through the year 1944 (and perhaps in some cases beyond) the chlorophenylphenol of m.p. 72° (\tilde{C}) has been regarded as having the structure 4-chloro-2-phenylphenol = 5-chloro-2-hydroxybiphenyl = "p-chloro-o-phenylphenol." In 1945, however, this view was corrected by the paper of Weissberger and Salminen (1); in this text, therefore, expression of the facts is reported in the light of their paper. Particular care is, therefore, required in consulting reference prior to it since such material is universally expressed in the reverse sense of the present view.

[For prepn. of \bar{C} from 2-hydroxybiphenyl (1:1440) with Cl_2 (note that 4-chloro-2-phenylphenol (3:8980) is also formed) see (2) (4); for prepn. of \bar{C} from 3-amino-2-hydroxybiphenyl (5) by diazotization and use of Cu_2Cl_2 reaction (45% yield (1)) see indic. refs.]

 \bar{C} is sol. in aq. 25% NaOH at 60°, but resultant salt is more sol. than corresp. prod. from the isomeric 4-chloro-2-phenylphenol (3:8980) (for use in sepn. of \bar{C} from the latter see (4)); note that sodium salt of \bar{C} cryst. as trihydrate, i.e., Na \bar{A} .3H₂O (4), and that anhydrous Na \bar{A} dec. at 316° without melting (4).

The calcium salt of \bar{C} is very spar. sol. aq. (use in sepn. of \bar{C} from the isomeric 4-chloro-2-phenylphenol (3)).

[For reaction of C with methallyl chloride (3:7145) in pres. of alk. see (10).]

C on mononitration with HNO₃ in AcOH at 15-19° as directed gives (31% yield (1)) 3-chloro-2-hydroxy-5-nitrobiphenyl, tan needles, m.p. 130-131° (1), 129-131° (6).

[\tilde{C} (?) on condensation with formaldehyde + ethanolamine as directed (9) gives a prod., m.p. 182-183°; for similar condens. of \tilde{C} (?) with formaldehyde + morpholine see (7).]

$$\begin{array}{c|cccc} \text{OH} & \text{C}_7\text{H}_7\text{OCl} & \textbf{Beil. VI} - \\ & & & \text{VI}_1\text{-}(\textbf{174}) \\ & & & \text{VI}_2\text{-}(\textbf{332}) \end{array}$$

M.P. 73-74° (1) (4)

Long white hard ndls. from pet. eth.; eas. sol. alc., AcOH; less sol. pet. eth. (1). Č is eas. sol. alk. (1).

[For prepn from 5-chloro-2-methylandine [Bed. XII-835] see (1) (4)]

 \bar{C} on mononitration (2) in AcOH with fumg. HNO₃ at 5° gives mixt. of two mononitration products: 6-nitro-5-chloro-2-methylphenol, volatile with steam, golden-yel. pr. from peteth., m.p. 54.5-55° (2), and 4-nitro-5-chloro-2-methylphenol, not volatile with steam, cryst. from aq. or C_6H_6 , m.p. 144-145° (2).

 \bar{C} on nitration (3) with 3 pts. HNO₃ (D=1 48) at 0° gives a dinitro compd., 4,6-dinitro-5-chloro-2-methylphenol [Beil. VI₁-(181)], yel. ndls., from pet. eth., m.p. 146° (3); acetyl deriv., m.p. 109-110° (3).

[For action of HNO_2 on \bar{C} see (4).]

D 5-Chloro-2-methylphenyl benzoate: from $\ddot{C}+BzCl+aq.$ alk., white lfts. from alc., m.p. $53-54^{\circ}$ (1).

3:1815 (1) Zincke, Ann. 417, 207-208 (1918). (2) von Auwers, Schornstein, Cent. 1924, II 2269. (3) Zincke, Ann. 418, 234 (1918). (4) Hodgson, Moore, J. Chem. Soc. 1926, 2037.

3:1820 1,1,1-TRICHLORO-2-(o-CHLOROPHENYL)-2-(p-CHLOROPHENYL)ETHANE ("o,p'-DDT")

 $CI \longrightarrow CII--CCl_3$ Beil. S.N. 479

M.P. 74.0-74.5° (4) cor. (6) **73-74°** (5)

This compound is the so-called o,p-isomer of "DDT" (3:3298). Although known to be a substantial contaminant (e.g., 18% (1) -19% (5)) of technical "DDT," very little information is at present available regarding it.

Cryst. from MeOH.

[For prepn. of \bar{C} from 2,2,2-trichloro-1-(o-chlorophenyl)ethanol (5) with chlorobenzene (3:7903) in pres. of conc. H_2SO_4 at 60° (64% yield) see (5).]

C on dinitration with fumg. HNO₃ at 50° for 1 hr gives (5) a dinitro deriv., cryst. from 95% alc., m.p. 148.0-148.5° cor. (5); note that this prod. has same m.p. as corresp. deriv. from "DDT" but that m.p. of a mixt. of the two dinitro compds. is depressed.

 \bar{C} on tetranitration with a mixt. (1:1 by volume) of fumg. HNO₃ + conc. H₂SO₄ at 100° for 1 hr. gives (2) a prod., m.p. 229.5-230° cor.; note that the corresp. prod. from "DDT" has m.p. 223.5-224.5° cor. (2).

C with anhydrous AlCl₃ (1 mole) + large excess C₆H₆ at ord. temp. evolves HCl and gives (10% yield (3)) 1,1,2,2-tetraphenylethane, m.p. 211°; in this connection see corresp. behavior of "DDT" (3:3298).

 \tilde{C} with alc. KOH loses 1 HCl giving (97% yield (5)) (7) 1,1-dichloro-2-(o-chlorophenyl)-2-(p-chlorophenyl)ethylene (3:1925), accompanied by a little o_pp' -dichlorodiphenylacetic acid, m.p. 106-107.5° cor. (7), the proportion of which may be increased by reaction of \tilde{C} with Ba(OH)₂ in ethylene glycol at 175° (7).

Soc. 67, 1498 (1945). (7) Cristol, Haller, J. Am. Chem. Soc. 67, 2222-2223 (1945).

M.P. 74-75° (1) 74° (2)

Ndls. from lgr.

[For prepn. of \tilde{C} from 2,5-dimethylphenol (p-xylenol) (1:1473) by chlorination with SOCl₂ in CHCl₃ (1) or AcOH (2) see indic. refs]

[For studies of bactericidal action of C see (2) (3).]

[For behavior of \bar{C} with o-mitrosulfenyl chloride see (4) cf. (5); behavior of \bar{C} with sulfur chloride in CS₂ see (1).]

- ---- 4-Chloro-2,5-dimethylphenyl acetate: unreported.
- ---- 4-Chloro-2,5-dimethylphenyl benzoate: unreported.

3:1822 (1) Lesser, Gad, Ber. 56, 977 (1923) (2) Heicken, Angew. Chem. 52, 264-265 (1939). (3) Lockemann, Kunzmann, Angew. Chem. 46, 296-301 (1933). (4) Learmonth, Smiles, J. Chem. Soc. 1936, 327-328. (5) McClement, Smiles, J. Chem. Soc. 1937, 1019-1021.

M.P. 73-75° (1)

Cryst. with sharp odor suggesting chloroacetic acid. — Sol. in 20 pts. aq. — $\tilde{\mathbf{C}}$ blisters skin. — $\tilde{\mathbf{C}}$ in small amts. (5 g.) can (with care) be distilled, but attempts to distil larger units lead to decomposition with loss of HCl (2).

[For prepn. of \tilde{C} from α,α,γ -trichloro-n-butyraldehyde (3:9094) by odixn. with fumg. HNO_3 in cold see (1).]

C does not react with Zn dust in aq. or with aq. KI even at 100° (2); C does not react with NH₂OH (2).

 \ddot{C} on boilg. with aq. (100 pts.) for 4 days yields (2) a soln. which is strongly acid, reduces Fehling soln. and hot NH₄OH /AgNO₃, and presumably conts. HOCH₂.CH₂.CO.COOH.

 \tilde{C} with aq. Na₂CO₃ loses one of its three chlorine atoms (probably that in γ position) and upon acidification gives a soln. presumably contg. a lactone; for details see (2).

The acid chloride corresp. to C is unreported.

- Methyl α, α, γ -trichloro-n-butyrate: unreported.
- Ethyl α,α,γ -trichloro-n-butyrate: unreported.
- α,α,γ -Trichloro-n-butyramide: unreported.
- α,α,γ -Trichloro-n-butyranilide: unreported.
- ---- α, α, γ -Trichloro-n-butyr- α -naphthalide: unreported.

-TRICHLOROACRYLIC Cl C₃HO₂Cl₃ Beil. II - 402 Π_1 -(187) Π_2 -(388) M.P. 76° (1) (2) (13) B.P. 221-223° at 760 mm. (5) 74-75° (3) 133° cor. at 30 mm. (5) 73° (4) 72.9° (5)

236

Pr. from CS₂ or dry ether. — $\bar{\rm C}$ is very eas. sol. hot aq. but spar. sol. cold aq.; at 25° its satd. aq. soln. conts. 6.4% $\bar{\rm C}$ (1), at 20° 6% $\bar{\rm C}$ (2). — $\bar{\rm C}$ with aq. within certain limits forms two liq. layers; for thermal anal. of the system see (5); note that $\bar{\rm C}$ with aq. forms a compd. of compn. $\bar{\rm C}$ + 2.5 H₂O, m.p. -0.6°, and that $\bar{\rm C}$ with this compound forms a eutectic, m.p. 17° (5). — $\bar{\rm C}$ is very sol. in alc., ether, or CHCl₃.

[C is usually prepd. from hexachloropropylene (3:6370) by direct or indirect hydrolysis of its terminal —CCl₃ group to —COOH; for prepn. of C from hexachloropropylene by such hydrolysis with 90% H₂SO₄ in pres. of Al₂(SO₄)₃ at not above 130° (5) (1) cf. (6) (7) (81% yield (13)) or with boilg. aq. susp. of BaCO₃ (isolated as BaĀ₂ in 92% yield (1)) see indic. refs.; for prepn. of C from hexachloropropylene (3:6370) via conversion with alc. NaOEt to triethyl orthotrichloroacrylate and subsequent quantitative hydrolysis with alc. KOH see (4).]

[For form. of \bar{C} from hexachlorocyclopentanedione-1,3 [Beil. VII-553] by hydrolytic cleavage with 10% NaOH (3), or from β -bromo- α,β,β -trichloropropionic acid (see below) by elimination of HBr on stdg. several days with aq. Ba(OH)₂ (2), see indic. refs.]

 \bar{C} on reduction with H_2 in pres. of Pd cat. at ord. temp. and press. absorbs 4 moles H_2 yielding (8) propionic acid (1:1025).

 \bar{C} with Cl_2 in CCl_4 soln. in sunlight adds 1 mole halogen giving (9) (8) pentachloropropionic acid (3:4895).

[\bar{C} with HBr might be expected to yield β -bromo- α,β,β -trichloropropionic acid, but this reaction is unreported although the expected prod. [Beil. II-257], m.p. 83-84° has been prepd. by other means and with Ba(OH)₂ loses HBr giving \bar{C} (2).]

 \ddot{C} with half its wt. of PCl₅ at 80° loses H₂O between two molecules giving (4) trichloro-acrylic acid anhydride, cryst., insol. aq., m.p. 39-40° (4) (5); this product is also formed during the distillation of \ddot{C} even at reduced press. (5).

Č with excess SOCl₂, however, gives (80-90% yield (1)) (13) trichloroacryloyl chloride (3:5845) q.v.

Salts of \bar{C} . [Na \bar{A} (conductivity of aq. solns.) (10); K \bar{A} , spar. sol. cold aq. (2); Ag \bar{A} , spar. sol. cold aq. but recryst. from hot aq. without decompn. (2) (4); Mg \bar{A}_2 .3½H₂O, sol. aq. (10); Ca \bar{A}_2 .3½H₂O, sol. aq. (10) (2); Sr \bar{A}_2 .5H₂O, sol. aq. (10); Ba \bar{A}_2 .3½H₂O, sol. aq. (10) (2) (note that this salt on htg. in atm. of H₂ gives (11) dichloroacetylene (3:5010)); Zn \bar{A}_2 .6H₂O and Zn \bar{A}_2 .3½H₂O (10); Cd \bar{A}_2 .2H₂O (10); Hg \bar{A}_2 (no crystal aq.) (10).]

- Methyl α, β, β -trichloroacrylate: unreported.
- Ethyl α,β,β -trichloroacrylate: b.p. 192–194°; 112–114° at 50 mm.; $D_4^{20} = 1.2183$; $n_D^{20} = 1.4649$ (4). [Prepd. indirectly from triethyl orthotrichloroacrylate (itself obtd. from hexachloropropylene with NaOEt) by shaking with conc. HCl (4).]
- Φ α,β,β -Trichloroacrylamide: m.p. 97° (12), 96–97° (4), 96° (2). [From trichloroacryloyl chloride (3:5845) with conc. NH₄OH (4) or from ethyl trichloroacrylate (above) with alc. NH₃ (12).]
- α,β,β-Trichloroacrylanilide: m.p. 98° (13). [From trichloroacryloyl chloride (3:5845) with aniline in CHCl₃ at 0° (77% yield) (13).]

M.P. 76° (1)

Colorless cryst. from CS₂ + CHCl₃; fairly sol. aq.

[For prepn. of \bar{C} from α,β -dichloroacrylic acid (3:2265) in CS₂ with dry Cl₂ in sunlight see (1).]

Salts: KA; AgA (readily dec. to AgCl on warming aq. soln.); CaA2; BaA2 (1).

3:1850 (1) Maberry, Smith, Ber. 22, 2659-2660 (1889).

M.P. 76-77° (1) (2) (3) (Also see text.)

Ndls. from pet. ether or by sublimation. — \bar{C} is spar. sol. aq. but very eas. sol. ether or CHCl₃. — \bar{C} on htg. above its m.p. (e.g., to 120°), then rapidly cooled to 60° or below remelts at 63-64° (2) (3); on standing, however, \bar{C} finally reverts to the form of m.p. 76-77°. — \bar{C} decomposes on attempted distn.

[For prepn. of \tilde{C} from propiolic acid (acetylene-carboxylic acid) [Beil. II-477] by conversion to chloropropiolic acid (3:1685) and subsequent addr. of 1 HCl by htg. with a large excess cone. HCl at 100° for 5 hrs. (77% overall yield from propiolic acid) see (1); for formn. from "chloralide" (3:3510) by reduction with Zn + HCl in alc. soln. see (2) (3).]

The behavior of C toward hydrogenation has not been reported.

Neither C nor its ethyl ester (see below) adds Br₂ (3).

 $[\bar{C} \text{ with aq. Ba}(OH)_2 \text{ on boilg. splits both HCl and CO}_2 \text{ yielding chloroacetylene (3:7000);}$ the formn. of this highly explosive substance probably accounts for the ignition and detonation sometimes observed cf. (2) (1).]

Salts: $K\bar{A}$ (3); $Ag\bar{A}$ (3); $Ca\bar{A}_2.2H_2O$ (2); $Ba\bar{A}_2.2H_2O$ (2); $Zn\bar{A}_2.2H_2O$ (3).

 $\ddot{\mathbf{C}}$ with PCl₅ gives (3) β,β -dichloroacryloyl chloride, b.p. above 145°; this prod. with EtOH or $\ddot{\mathbf{C}}$ in EtOH with dry HCl gives (3) ethyl β,β -dichloroacrylate, b.p. 173–175°.

—— β₂β-Dichloroacrylamide: ndls. from CHCl₃, m.p. 112-113° (3). [From the above acid chloride with dry NH₃ (3).]

3:1890 1,1-DICHLORO-2-(o-CHLOROPHENYL)-2-(p-CHLOROPHENYL)ETHANE ("o,p-DDD")

$$\begin{array}{c|c} C_{14}H_{10}Cl_{4} \\ \hline Cl & Cl \\ C-CH \\ Cl & II & Cl \\ \end{array}$$

M.P. 76-78° (1)

Colorless cryst. from MeOH or from pentane. — Note that \tilde{C} is a minor impurity in technical grade "DDT" (3:3298).

[For prepn. of \bar{C} from 2,2-dichloro-1-(o-chlorophenyl)ethanol (1) with chlorobenzene (3:7903) in pres of H_2SO_4 (39% yield) see (1).]

 \bar{C} with alc. KOH loses 1 HCl giving (1) 1-chloro-2-(o-chlorophenyl)-2-(p-chlorophenyl)-ethylene (not described) which upon oxidn. with $CrO_3/AcOH$ gives (1) 2,4-dichlorobenzo-phenone (3:1565).

3:1890 (1) Haller, Bartlett, Drake, Newman, Cristol, et al., J. Am. Chem. Soc. 67, 1600 (1945).

M.P. 77° (1) (4) B.P. 176.6° at 5 mm. (5)

 \bar{C} is sol. in NaOH. [For prepn. of Na \bar{A} using solns. of \bar{C} in org. solv. such as McOH, ether, or toluene see (2).]

Č htd. with NaOH/Na₂CO₃ soln. under press for 3 hrs. at 290–300° gives 4-phenyl-pyrocatechol [Beil. VI-990], m p. 145°; diacetate, m.p. 77 5–78° (3).

C in CCl₄ stood 5 days with 1 mole Br₂ gave (44% yield) 6-bromo-2-chloro-4-phenylphenol, wh. pr. (from CHCl₃), m p. 84-86° cor. (4); C in AcOH (25% yield) or in CS₂ (56% yield) stood 2 days with 2 moles Br₂ gave 6-bromo-4'-(p-bromophenyl)-2-chlorophenol, coarse wh. ndls., m.p. 143-146° cor. (4)

C in AcOH treated with 1 mole HNO₃ in AcOH gave 38% yield of 2-chloro-6-nitro-4-phenylphenol, thick yel. pl. (from CCl₄), m.p. 89-90° cor. (5).

 \overline{C} with $(CH_3)_2SO_4 + NaOH$ (1) or $CH_3I + aq$. KOH (5) yields the corresp. Me ether, 2-chloro-4-phenylanisole, m.p. $91-92^\circ$ (1), 93° cor. (5).

- 0 2-Chloro-4-phenyl-phenyl acetate: m.p. 68° (7). [From $\ddot{C} + Ac_2O + NaOAc$ in 92% yield (7).]
- 2-Chloro-4-phenyl-phenyl benzoate: from C + BzCl + aq. alk. in 80% yield (4); cryst. from AcOH (4), m.p. 95-97° cor. (4), 110-111° (6).
- 2-Chloro-4-phenyl-phenyl benzenesulfonate: m.p. 59-60° (8). [From C + benzenesulfonyl chloride + aq. 10% NaOH (8).]
- ② 2-Chloro-4-phenyl 2,4-dinitrophenyl ether: from C + 2,4-dinitrochlorobenzene in conc. aq. KOH refluxed for several hrs.; yield, 70%; m.p. 109-111°C. (4).

$$\alpha,\beta$$
-DICHLORO- n -BUTYRIC H H $C_4H_6O_2Cl_2$ Beil. II -279 ACID (high-melting isomer) (lsocrotonic acid dichloride) CH_3 — C — C —COOH II_1 — II_2 —

[See also α, β -dichloro-n-butyric acid (low-melting isomer) (crotonic acid dichloride) (3:1375).]

Colorless cryst. from pet. ether $-\bar{C}$ is very eas. sol. alc., ether, much less sol. ag.

[For prepn. of \bar{C} from α -chlorocrotonic acid (3:2760) by addn. of 1 HCl using conc. aq. HCl (satd. at 0°) in s.t. at 100° for 50 hrs. see (2) (4); from either α -chloro- β -hydroxy-n-butyric acid of m.p. 62° [Beil. III-309] (4) or from β -chloro- α -hydroxy-n-butyric acid of m.p. 125° [Beil. III-306] (3) by htg. with conc. aq. HCl (satd. at 0°) in s.t. at 100° for 40 hrs. see indic. refs.; for formn of \bar{C} by (partial) isomerization of the lower-melting isomer (crotonic acid dichloride) (3:1375) with conc. HCl in s.t. at 100° see (5); from the amide (see below) corresp. to \bar{C} with HNO₂ see (1)]

 \bar{C} behaves as an acid but is slightly weaker than its isomer; ionization const. of \bar{C} is 6.1×10^{-3} (5); its reported salts include AgA, spar sol. aq (4); BaA2.3H2O (4): and ZnA2 (4).

 \bar{C} with ale. KOH loses 1 mole HCl giving (2) (4) mainly α -chlorocrotonic acid (3:2760) accompanied by some α -chloro-isocrotonic acid (3:1615).

The acid chloride corresp to C is unreported.

- —— Methyl α,β -dichloro-n-butyrate: unreported.
- —— Ethyl α, α -dichloro-n-butyrate: unreported.
- —— α,β-Dichloro-n-butyramide: m p 125° (1). [Prepd. indirectly but with HNO₂ gives C (1)]

3:1905
$$\alpha,\alpha,\beta$$
-TRICHLORO- n -BUTYR- Cl C₄H₇O₂Cl₃ Beil. I - 664
ALDEHYDE HYDRATE | CH₃ CH₋C-CH_.OH | I₁-C_.(725)

[See also α,α,β -trichloro-n-butyraldehyde (butyrchloral) (3:5910).]

Lfts. from aq. or alc. — Spar. sol cold but fairly eas. sol hot aq.; very eas. sol. alc. — For crystallographic data see (3) (5). — Note that because of tendency to dissociate on htg. into butyrchloral (3:5910) + aq. the m.p. observed for \bar{C} varies according to rate of htg. (3). — Note also that \bar{C} is isomeric with chloral ethylalcoholate (3:0860) with which it must not be confused; for distinction of \bar{C} from chloral hydrate (3:1270) see (9) (10).

Č is employed in medicine as a sedative; from the body it is excreted in the urine as urobutyrochloralic acid [Beil 1-664], which upon hydrolysis yields (4) 2,2,3-trichlorobutanol-1 (3:1336) + glucuronic acid [Beil. III-884, III₁-(306)].

[For prepn. of C from butyrchloral (3:5910) by reactn. with aq. see (1) (2) (6).]

 $[\bar{C}$ is reduced by fermenting yeast giving (7) dextrorotatory 2,2,3-trichlorobutanol-1, m.p. 62°; for actn. of \bar{C} on alc. fermentation see (8).

 $\tilde{\mathbf{C}}$ on oxidn. with 3 wt. pts. fumg. HNO₃ (D=1.504) at 30-35° for $1\frac{1}{2}$ hrs. then stood at room temp. for 24 hrs. gives (95% yield (11)) α,α,β -trichloro-n-butyric acid (3:1280).

C on distn. with half its wt. of Ac₂O (12), or shaking with conc. H₂SO₄ (13), or on distn. with CHCl₃ (14), or on htg. alone loses its combined aq. yielding butyrchloral (3:5910), b.p. 165°.

 \overline{C} with conc. H₂SO₄ (at least 6 wt. pts.) at room temp. for 2 days trimerizes to a mixt. (80% yield (12)) of two parabutyrchlorals: these are colorless crystn., sharp-melting solids, sol. in org. solvents, but insol. aq.; the less sol. α -parabutyrchloral, rhombic cryst. from boilg. AcOH or boilg. EtOH, has m.p. 180°; the more sol. β -parabutyrchloral (stereoisomer?), cryst. from boilg. AcOH or boilg. EtOH, has m.p. 157°; these polymers can be distilled at 15 mm. but attempts to distill them at ord. press. result in complete dissociation to butyrchloral (3:5910).

Č with aq. KOH or NaOH evolves heat and yields (1) (15) 1,1-dichloropropene-1 (3:5120) + the salt of formic acid (1:1005).

[$\bar{\mathbf{C}}$ with conc. aq. HCN fails (16) to react, but upon addn. of alc. and subsequent digestion (16), or $\bar{\mathbf{C}}$ (1 mole) with aq. KCN (2 moles) at 40° (17), gives (20% yield (17)) α,α,β -trichloro-n-butyraldehyde cyanohydrin [Beil. III-322, III₂-(226)], pl. from aq., m.p. 101-102° (17) (18), accompanied by (61% yield (17)) α -chlorocrotonic acid (3:2760), m.p. 98.5-99° (17). — Note that $\bar{\mathbf{C}}$ (1 mole) in alc. treated gradually with powdered KCN (2 moles) below 15° over a 3-4 hr. period gives (90% yield (17)) ethyl α -chlorocrotonate (3:8523); in this reactn. the intermediate ethyl α,β -dichloro-n-butyrate readily loses HCl and is generally not isolated; use of alcs. other than EtOH gives good yields of the corresp. alkyl α -chlorocrotonates (17). — Note that for $\bar{\mathbf{C}}$ with KCN in $\mathbf{C}_6\mathbf{H}_6$ the reaction takes a different course (17). — Finally, note that $\bar{\mathbf{C}}$ (1 mole) in cone. aq. NH₄OH first dissolves, then ppts. butyrchloral-ammonia as a heavy oil; the mixt. on satn. with dry NH₃ gas in cold followed by treatment at 10° with powdered KCN (1 mole) evolves heat and gives (93% yield (17)) α -chlorocrotonamide, m.p. 113.5° (17).]

[$\bar{\mathbf{C}}$ undergoes condensation with various org. systems: e.g., $\bar{\mathbf{C}}$ with phenyl isocyanide (1 mole) in ether for 4–5 days gives (53% yield (19)) α -hydroxy- β , β , γ -trichloro-valeranilide, tbls. from alc., $\mathbf{C}_6\mathbf{H}_6$, or CHCl₃, m.p. 156–158° (19). — $\bar{\mathbf{C}}$ (1 pt.) with malonic acid (1:0480) (1 pt.) in pyridine (1 pt.) at 100° for 3 hrs. evolves CO₂ and gives (20) β -hydroxy- γ , γ , δ -trichloro-n-caproic acid, cryst. from hot aq., m.p. 102° (20). — $\bar{\mathbf{C}}$ (1 mole) with nitromethane (1½ moles) in dil. alc. in pres. of Na₂SO₃ at 60° gives (100% yield (21)) 1-nitro-3,3,4-trichloropentanol-2, b.p. 156° at 4 mm., m.p. abt. 20° (21); $\bar{\mathbf{C}}$ (1 mole) with nitroethane (1 mole) in 50% alc. in pres. of Na₂SO₃ + K₂CO₃ at 70° gives (22) 2-nitro-4,4,5-trichlorohexanol-3, b.p. 138° at 0.75 mm. (22).]

[$\bar{\mathbf{C}}$ forms with various org. substances molecular cpds. of pharmaceutical interest: e.g., $\bar{\mathbf{C}}$ (1 mole) with quinine (base) (1 mole) in abs. alc. at 75° for 1 hr. gives 1:1 cpd., m.p. 139° (note that the corresp. cpd. from chloral (3:5210) + quinine has m.p. 149° (23}). — $\bar{\mathbf{C}}$ (1 mole) with 2,3-dimethyl-1-phenylpyrazolone-5 ("Antipyrine") (1 mole) (m.p. 112°) rubbed together and recrystd. from aq. gives (24) 1:1 molecular cpd., colorless pr., m.p. 72° (for f.p./compn. data and diagram of this system see (24)). — $\bar{\mathbf{C}}$ with 2,3-dimethyl-4-dimethylamino-1-phenylpyrazolone-5 ("Pyramidone") (m.p. 107.5°) on fusion or in aq. or $\bar{\mathbf{C}}_6\mathbf{H}_6$ (25) (26) gives a 1:1 mol. cpd. ("Trigemin"), cryst. from $\bar{\mathbf{C}}_6\mathbf{H}_6$, m.p. 85–86° (26), long ndls. from aq., m.p. 84° (24) (for f.p./compn. data and diagram on this system see (24)); for stabilization of "Trigemin" by addn. of 5–10% hexamethylenetetramine (27) or 2% MgO (28) see indic. refs.]

[\bar{C} with various org. hydroxy acids in pres. of conc. H₂SO₄ condenses to give prods. of the chloralide type: e.g., for reactn. of \bar{C} with citric acid (1:0505), malic acid (1:0450), or tartaric acid (1:0525) see (29); with gallic acid (1:0875) (and numerous other phenolic acids) see (30).]

 \bar{C} with conc. aq. NH₄OH first dissolves then ppts. a heavy oil of butyrchloral-ammonia (17); cryst. m.p. 62° (see also above for its reaction with KCN).

[Č with excess dry NH₄OAc on moderate htg. for several hrs., then pouring into aq., gives (18) α,α,β -trichloro-n-butyraldimine, cryst. from C₆H₆, m.p. 169-170° (31), 164-165° (18); observe that this m.p. is notably close to that of the condensation prod. of butyr-chloral (3:5910) with acetamide, and that latter is readily formed from NH₄OAc by dry htg.; this matter, however, seems to have received no further attention.]

 \bar{C} with aq. NH₂OH.HCl on htg. readily yields (32) α,α,β -trichloro-n-butyraldoxime (first separating as an oil), cryst. from lgr., m.p. 65° (32).

The reaction of \tilde{C} with arylhydrazines is of special interest and has been extensively studied. With phenylhydrazine the reaction is extremely vigorous (33) (34) and unless carefully controlled (35) may become almost explosively violent yielding only tar. With nuclear-substituted phenylhydrazines, however, the reaction is milder, and their study has shown that all arylhydrazines react in the same general pattern although this comprises several different courses according to the solvent used. The pattern will be illustrated here only by the case of 2,4-dichlorophenylhydrazine (see below); for details of the analogous reaction of \tilde{C} with phenylhydrazine (33) (34), o-, m-, and p-tolylhydrazines (34), 2,5-dichlorophenylhydrazine (35) (36), 3,5-dichlorophenylhydrazine (35), 2,4,5-trichlorophenylhydrazine (36), p-bromophenylhydrazine (37), 4,5-dibromophenylhydrazine (35), and 2,4,6-tribromophenylhydrazine (35) see indic. refs.

[The reactn. of $\tilde{\mathbb{C}}$ (1 mole) with 2,4-dichlorophenylhydrazine hydrochloride (1 mole) first gives the expected butyrchloral 2,4-dichlorophenylhydrazone (A) which, however, cannot be isolated because of immediate further reaction in two different modes according to the solvent employed. In dil. aq. HCl contg. NaOAc (A) loses HCl in two different ways leading on one hand to α,β -dichlorocrotonaldehyde 2,4-dichlorophenylhydrazone (B), long yel. pr. from alc. or AcOH, m.p. 112° (33), and on the other (simultaneously and with rearr. of unsatd. linkages) to the crimson 1-(2,4-dichlorobenzeneazo)-2,3-dichlorobutene-1 (C) (in most instances the last is not isolatable in pure form although it has been in the case (37) of $\tilde{\mathbb{C}}$ with 2,4-dibromophenylhydrazine); in MeOH, EtOH, or AcOH, however, the two α -chlorine atoms of the initial arylhydrazone (A) undergo hydrolysis with consequent formn. of β -chloro- α -keto-n-butyraldehyde 2,4-dichlorophenylhydrazone (D), pale yel. pr. from alc., m.p. 129° (33).]

[This last type of cpd. (D) can be caused to undergo two further important types of reaction: e.g., (D) with further 2,4-dichlorophenylhydrazine in MeOH soln. not only undergoes conventional condensation of its α -keto grouping but also has the β -chlorine atom replaced by methoxyl so that the product obtd. is β -methoxy- α -keto-n-butyraldehyde bis-(2,4-dichlorophenyl)osazone (E), bright yel. pr. from pyridine or C_0H_0 , m.p. 196° dec. (33) (this reaction occurs so readily in MeOH that from C + 2,4-dichlorophenylhydrazine hydrochloride both (D) and (E) are formed and may be separated by fractional crystn.); on the other hand, (D) with alc. NaOEt on htg. loses HCl and ring-closes (38) to 1-(2,4-dichlorophenyl)-4-hydroxy-5-methylpyrazole (F), colorless cryst. from boilg. alc., m.p. 184° (38) (this type of reactn. comprises a general synthesis of 4-hydroxypyrazoles).]

Colorless and best recrystd. from commercial n-heptane (Skellysolve "C") (1); Ifts, from aq. alc. (4). - Very spar. sol. aq., quite sol. alc. or C6H6, misc. with other. [For study of ionization const. see (3).] — [For study of fate of \bar{C} in animals see (5).]

[For prepn. of C from m-chlorobenzyl bromide (mp. 15-15.5° cor., bp. 103-105° at 8 mm., $D_{25}^{25} = 1.5652$ (1)) via conversion to m-Cl.C₆H₄.CH₂MgBr and subsequent carbonation (65-75% yield) see (1); from m-aminophenylacetic acid [Beil. XIV-456, XIV₁-(588)] via diazotization and use of Cu₂Cl₂ reactn. (but no details reported) (5); from m-chlorophenylpyruvic acid (4) in dil. aq. NaOH with 30% H₂O₂ (57% yield) see (4); from mchlorophenylacetonitrile, m.p. 11.5°, bp 261° at 757 mm. (2), by hydrolysis in H₂SO₄/ .AcOH /aq. see (2).]

[For reactn. of closely related m-Cl.C₆H₄.CH₂.COOMgX with large excess of various RMgX cpds. see (6) and also under m-chlorobenzyl chloride (3:6445).]

[C with SOCl2 yields (5) m-chlorophenylacetyl chloride, yel.-green liq., b.p. 52° at 16 mm. (5); this prod. with aminoacetic acid (glycine) in dil. aq. NaOH yields (5) m-chlorophenylacetaminoacetic acid (m-chlorophenylaceturic acid), colorless ndls. from aq., m.p. 144-145° (5).1

[C converted to its Pb salt, latter dried at 110° and distilled, yields (2) 3,3'-dichlorodibenzyl ketone, colorless ndls. from alc., m.p. 89° (2) (corresp. oxime, m.p. 73° (2), semicarbazone, m.p. 121° (2)).]

- Methyl 3-chlorophenylacetate: unreported.
- Ethyl 3-chlorophenylacetate: unreported.
- (3-Chlorophenylacet)anilide: thin white pl. from dil. alc., m.p. 130° cor. (1). [From

Č with 1 mole aniline on htg. at 180-190° for 2 hrs. (1), or indirectly from m-chlorobenzyl phenyl ketoxime by Beckmann rearr. with PCl₅ in ether (64-82% yield (1)).]

(3-Chlorophenylacet)-m-chloroanilide: white ndls. from dil. alc., m p. 120° cor. (1). [From C with m-chloroaniline (1 mole) on htg at 180-190° for 2 hrs. (1), or indirectly from m-chlorobenzyl m-chlorophenyl ketoxime by Beckmann rearr. with PCl₅ in ether (64-82% yield (1)).]

Soc. 54, 3307-3309*(1932). (5) Muenzen, Cercedo, Sherwin, J. Biol. Chem. 68, 508-510 (1926). (6) Ivanov, Pchnénitchny, Bull. soc. chm. (5) 1, 231-232 (1934).

Colorless cryst. from alc. (0.8 ml./g. (5)); somewhat less sol in alc. than isomeric 2-chlorobiphenyl (3:0300). — Volatile with steam. — [For f p./compn. curves of systems: \bar{C} + biphenyl (1:7175), \bar{C} + 4-fluorobiphenyl, or \bar{C} + 4-bromobiphenyl, see (7)]

[For prepn. of \bar{C} from biphenyl (1:7175) with Cl_2 in pres. of Fe (30% yield (5)) (14) (16) (17), or SbCl₅ (12), see indic. refs. (2-chlorobiphenyl (3:0300) is also formed; for use of mixt. for transformer oil see (18); for sepn. of mixt. see (19)); for prepn. of \bar{C} from p-aminobiphenyl via diazotization and use of Cu_2Cl_2 reactn. see (2) (7).]

[For prepn. of \bar{C} from p-chloroaniline [Beil. XII-607, XII₁-(604)] via diazotization and coupling of resultant diazonium salt with C_6H_6 in aq. NaOH suspension (yields: 41% (1), 40% (6)) cf. (21) (23) or in aq. NaOAc (yield = 35% (6)), or by formn. of p-chlorobenzene-diazonium chloride/ZnCl₂ cpd. and reactn of latter with C_6H_6 in AcOH + NaOAc (yield = 34% (20)) see indic. refs.: from N-nitroso-acet-p-chloroanilide with C_6H_6 in CHCl₃ for a few days at room temp see (13).]

[For formn. of \bar{C} from decompn. of dibenzoyl peroxide (1:4930) in boilg. chlorobenzene see (22); from decompn. of benzoyl *p*-chlorobenzoyl peroxide see (23); from di-(*p*-chlorobenzoyl) peroxide in C_6H_6 see (24)(4) (3); for formn. of \bar{C} from 4-hydroxybiphenyl (1:1585) with PCl₅ see (10); from *p*-xenylselenium trichloride on htg. see (25); from *p*-chloroiodobenzene + Cu powder see (2)]

[\bar{C} with aq. 15–30% NaOH at 300–400° under pressure (26) in pres. of Cu (27), or \bar{C} with aq. Na₂CO₃ + Cu at 300° (28), or \bar{C} with aq. vapor over cat. at 525–600° (29) gives (75% yield (26)) 4-hydroxybiphenyl (1:1585) (28) (29) or its mixt. with 3-hydroxybiphenyl (1:1475) (27)]

[\bar{C} with conc. aq. NH₄OH + cat. under press. as directed (30) (31) gives p-aminobiphenyl.]

[\bar{C} with Li in dry ether under N₂ gives (32) Li p-xenyl. — \bar{C} with Na sand in C₆H₆ at 110–120° under press. followed by carbonation with CO₂ gives (65–67% yield (33)) biphenyl-4-carboxylic acid (p-phenylbenzoic acid) [Bcil. IX-671, IX₁-(280)]. — \bar{C} with Na

+ diethyl carbonate (1:3150) in C_6H_6 as directed gives (yields: 42% (35), 35–40% (36), 39% (37), 23% (38)) tri-(p-xenyl)carbinol (tris-p-biphenylcarbinol) [Beil. VI-738, V₁-(369)], colorless cryst. from AcOH, m.p. 207–208° (36), 207° (38), 206–207° (37). — Č with Na + benzophenone (1:5150) in C_6H_6 gives (67% yield (34)) diphenyl-p-xenyl-carbinol [Beil. VI-732], colorless cryst. from lgr., stable form, m.p. 135–136° (34), metastable form, m.p. 112–113° (34).]

[For reactn. of \bar{C} with Na + AsCl₃ giving (39) tri-(p-xenyl)arsine, with Na + SbCl₃ giving (40) tri-(p-xenyl)stibine, with Na + PCl₃ giving (41) tri-(p-xenyl)phosphine, or with Na + SiCl₄ giving (42) tetra-(p-xenyl)silane see indic. refs.]

[\bar{C} + stearoyl chloride (3:9960) + AlCl₃ in CS₂ gives (43) heptadecyl *p*-chloroxenyl ketone, m.p. 96-97° (43). — \bar{C} + cyclohexene (1:8070) + AlCl₃ gives (44) a mixt. of cyclohexyl-*p*-chlorobiphenyls.]

 $[\tilde{C} + \text{phthalic anhydride } (1:0725) + \text{AlCl}_3 \text{ as directed } (45) (46) \text{ gives } (93\% \text{ yield } (45))$ $o-[4-(p-\text{chlorophenyl})\text{benzoic acid, colorless rods from AcOH or toluene, m.p. } 251^{\circ}$ cor. (45), $249.6-250.6^{\circ}$ (46).]

The nitration of \bar{C} does not appear to have been reported.

 $\tilde{\mathbf{C}}$ on oxidn. with CrO₃ in AcOH yields (10) (25) p-chlorobenzoic acid (3:4940), m.p. 237° (10) (25).

Colorless ndls. from alc., 80% alc., or ether + alc. — Eas. sol. hot alc. but spar. sol. cold alc., eas. sol. ether, spar. sol. cold lgr. [For search for possible polymorphic forms see (4) (9) (10).]

72-73°

(8)

[For prepn. of $\bar{\mathbb{C}}$ from benzoic acid (1:0715) + chlorobenzene (3:7903) with AlCl₃ (82.4% yield $\bar{\mathbb{C}}$ + 11.9% 2-chlorobenzophenone (3:0715) (1)), or with P_2O_5 at 180–200° (5), see indic. refs.; from benzoyl chloride (3:6240) + chlorobenzene (3:7903) with AlCl₃ (yields: 97% (37), 86% (8), 80–90% (7) (11), 45% (4), 40% (2)) (3) (some 2-chloro isomer also being formed (12)) see indic. refs.; from p-chlorobenzoyl chloride (3:6550) + benzene with AlCl₃ (84.6% yield) see (6); from tetra-(4-chlorophenyl)ethylene glycol bis-(magnesium iodide) in quant. yield with I₂ or O₂ see (13); from p-chlorobenzohydrylidene- α -phenylethylamine by hydrol. with warm dil. H₂SO₄ see (8).]

[\bar{C} on reduction with Al/Hg in 80% alc. (3) (14) or with 3% Na/Hg (7) or on boilg. with alc. KOH for 2 days (15), or exposure to sunlight for 7 days of its soln. in isopropyl alc. contg. Na isopropylate, gives (85% yield (3) (14), 80% yield (16)) 4-chlorophenyl-phenyl-carbinol. (4-chlorobenzohydrol) [Beil. VI-680, VI₁-(327)], m p. 67.5° (3) (14), 62° (7), accompanied by a little (14% (3) (14)) α,α' -diphenyl- α,α' -hs-(4-chlorophenyl)ethylene glycol (sym.-4,4'-dichlorobenzopinacol) [Beil. VI₁-(523)], m.p. 179° (3) (14). — \bar{C} with Zn + AcOH yields 4-chlorobenzohydryl acetate (12) or a mixt. (7) of 4-chlorobenzohydrol (above) + the corresp. pinacol (see below).]

[\bar{C} with Mg + MgI₂ in ether + C₆H₆ or \bar{C} in very dil. alc. soln. in sunlight (7) gives (94% yield (13)) sym.-4,4'-dichlorobenzopinacol, m.p. 172-178° (see above). — \bar{C} with Zn dust + H₂SO₄ in aq. AcOH yields (12) sym.-4,4'-dichloro- α -benzopinacoline (sym.-4,4'-dichlorotetraphenylethylene oxide) [Beil. XVII₁-(45)], ndls. from AcOH, m.p. 220° dec. (12). — For oxidn.-reductn. potential of \bar{C} see (35).]

[\bar{C} with conc. HI + red P in AcOH refluxed 14 hrs. gives (7) 4-chlorodiphenylmethane [Beil. V-590, V₁-(278), V₂-(500)], b.p. 298° at 742.5 mm. (7).]

[C with diphenylmethyl sodium (benzohydryl-sodium) followed by aq. gives (18) corresp. tertiary alc., viz., benzohydryl-p-chlorophenyl-phenyl-carbinol, m.p. 176-178° (18), which with acetyl chloride loses H₂O to give 4-chlorotetraphenylethylene [Beil. V₁-(376), V₂-(679)], m.p. 166-167° (18). — C with MeMgI in dry ether yields (19) p-chlorophenyl-phenyl-methyl-carbinol which on loss of aq. by htg. as directed gives (66% overall yield) a-(4-chlorophenyl)-a-phenylethylene, b.p. 164° at 16 mm. (19); note that this prod. with

Br₂ does not add halogen but rather evolves HBr yielding (20) both solid (m.p. 94–95°) and liq. stereoisomers of β -(4-chlorophenyl)- β -phenylvinyl bromide. — \bar{C} with β -(4-chlorophenyl)- β -phenylvinyl MgBr as directed (23) gives 1,4-di-(p-chlorophenyl)-1,4-diphenyl-butadiene-1,3, yellowish green ndls. from amyl alc., m.p. 230° (23). — \bar{C} with triphenyl-methyl MgBr in ether + C_6H_6 , followed by dil. Λ cOH, gives (21) 78% yield sym.-4,4-dichlorobenzopinacol (see above) + 80% yield triphenylmethyl peroxide.]

[Č with ethyl bromoacctate + Zn in dry C_6H_6 gives (yields: 79% (22), 67% (24)) ethyl β -(4-chlorophenyl)- β -hydroxy- β -phenyl-propionate, m.p. 79-80.5° (22), 69° (24); this prod. on htg with 85% formic acid gives (66% yield (24)) ethyl β -(4-chlorophenyl)cinnamate, b.p. 210-212° at 13 mm. (24), or on hydrolysis gives (22) β -(4-chlorophenyl)- β -hydroxy- β -phenylpropionic acid, m.p. 188.5-189.° dec. (22).]

 \bar{C} with PCl₅ at 150° gives (yields: 90% (25) (27), 88% (26) (8)) α , α , 4-trichlorodiphenylmethane (4-chlorobenzophenone dichloride) [Beil. V-592, V₁-(279)], b.p. 191-193° at 13 mm. (8), 189-194° at 12 mm. (25). $D_1^{20} = 1.302$ (25), $n_D^{20} = 1.6110$ (25); this prod. with Zn dust refluxed in dry ether for 1 hr gives (12% yield (25)) α , β -di-(p-chlorophenyl)- α , β -di (phenyl)ethylene, ndls. from alc., m p. 202-203° (25).

 \bar{C} fused with KOH/NaOH gives (28) benzoic and (66%) + p-chlorobenzoic acid (3:4940) (18%) + a little p-hydroxybenzoic acid (1:0840). — \bar{C} with 10% aq. NaOH in pres. of Cu under press. at 190° yields (29) 4-hydroxybenzophenone (1:1560).

[C with NH₃ in pres. of Cu cpds. at 170–300° under press. gives (30) 4-aminobenzophenone [Beil. XIV-81, XIV₁-(388)], lfts. from dil. alc., mp. 123–124°. — C condensed with NaNH.C₆H₅ as directed (31) yields 4-anilinobenzophenoneanil, m.p. 56° (for other amines and use of products as antioxidants see (31)); note, however, that by a closely similar method (36) p-chlorobenzophenoneanil, m.p. 64–64.5°, can also be obtd]

C on dinitration with abs. HNO₃ gives (32) a mixt. contg. 4-chloro-3,3'-dinitrobenzophenone, cryst. from toluene, m p. 166°, 4-chloro-3,2'-dinitrobenzophenone, cryst. from alc., m.p. 123.5°, and 4-chloro-3,4'-dinitrobenzophenone, m p. 136-136.5°.

- ① 4-Chlorobenzophenone oxime: This prod. is known in two stereoisomeric forms: the higher-melting isomer, m.p. 155-156° (6) (corresp. acetate, m.p. 147-148° (6), corresp. benzyl ether, m.p. 74-75° (6)), which on Beckmann rearr. (6) (34) with PCl₅, with conc. H₂SO₄ at 100°, or with AcOH/Ac₂O/HCl yields 4-chlorobenzanilide, is in the light of modern views on trans interchange regarded as the syn-(p-chlorophenyl) stereomer; the lower-melting isomer, m.p. 95° (6) (corresp. acetate, m.p. 105-106° (6), corresp. benzyl ether, m.p. 98-99° (6)), which on Beckmann rearr. with PCl₅ yields benz-p-chloroanilide, is now regarded as the trans-(p-chlorophenyl) stereomer. [A mixt. of these two stereoisomeric oximes contg. 56% high-melting form + 44% low-melting form (33) is obtd. from C with NH₂OH.HCl + pyridine in abs. alc. (33) or from C + NH₂OH.HCl + dil. alc. KOH (6); the two isomers are separated by means of their different solubilities in alc. (6) (34). Note that the lower-melting isomer is itself converted to the higher-melting form by htg. 3 hrs. at 100° (6) and also (in part) during Beckmann rearr.]
- **D** 4-Chlorobenzophenone phenylhydrazone: cryst. from ether /AcOH, m.p. 106° (34). [From $\bar{\mathbf{C}}$ with phenylhydrazine or phenylhydrazine acetate in alc. as directed (34).]
- 4-Chlorobenzophenone p-nitrophenylhydrazone: unreported.
- **10** 4-Chlorobenzophenone, 2,4-dinitrophenylhydrazone: m.p. 184-185° (Heilbron).

3:1915 DI-(TRICHLOROMETHYL) OCCl₃ (°₃O₃Cl₆ Beil. III - 17 CARBONATE III₁-(8) Carbonate, hexachlorodimethyl carbonate)

M.P.	78-79°	(1)	B.P. 203° at 760 mm., sl. dec.	(3)
	79°	(2) (3) (4)	124° at 50 mm.	(3)
			117° at 36 mm.	(2)
			105° at 22 mm.	(2)

Cryst. from anhydrous ether (1) (2) or pet. eth. (4). — Disagreeable penetrating odor; attacks mucous membrane.

 \bar{C} on distriction dissociates slightly into phosgene (3:5000) and diphosgene (trichloromethyl chloroformate) (3:5515) (4) (5); solid \bar{C} when mixed with powdered charcoal and heated to just above m.p. rapidly decomposes to phosgene (3:5000) (5).

[For prepn. of \bar{C} from dimethyl carbonate (1:3046) by chlorination in sunlight see (1); from methyl chloroformate (3:5075) by chlorination see (2)

 \bar{C} on treatment at 20° for 1 hr. with NaI in acetone evolves CO and separates iodine to 84% of amt. expressed by the reactn. Cl₃C.O CO.O.CCl₃ + 6NaI \rightarrow 3CO + 3I₂ + 6NaCl (6).

 \bar{C} with most reagents behaves like phospene; e.g., \bar{C} with alcohols gives ultimately dialkyl carbonates (7); \bar{C} with aniline in ether (7) or aq. (2) gives N,N-diphenylurea, m.p. 233° (7); \bar{C} with phenol + aq. NaOH gives (90% yield (7)) diphenyl carbonate (1:2335) cryst. from alc., m.p. 77.5-78° (7).

[For use of \bar{C} in prepn. of acid chlorides of carboxylic or sulfonic acids see (8); similarly \bar{C} htd. with anhydrous NaOAc yields Ac₂O (9).]

(U.S.S.R.) 1, 740-742 (1931); C.A. 26, 3234 (1932); Cent. 1932, II 2313.

3:1925 1,1-DICHLORO-2-(o-CHLOROPHENYL)-2-(p-CHLOROPHENYL)

C14H8Cl4 Beil. S.N. 480

M.P. 78.4-79.5° cor. (1)

Rectangular pl. from MeOH or EtOH.

[For prepn. of \bar{C} from 1,1,1-trichloro-2-(o-chlorophenyl)-2-(p-chlorophenyl)-thane ("o,p'-DDT") (3:1820) by elimination of 1 HCl with alc. KOH on refluxing 3 hrs. (97% yield) see (1).]

C on oxidn. with CrO₃/AcOH gives (1) 2,4-dichlorobenzophenone (3:1565), m.p. 64.2-65.2° cor.

3:1925 (1) Haller, Bartlett, Drake, Newman, Cristol, et al., J. Am. Chem. Soc. 67, 1599, 1602 (1945).

3:1930 1,2,5-TRICHLORONAPHTHALENE

M.P. 79° (1) 78-78.5° (2) (4) 77° (3) (See text.)

Cryst. volatile with steam. — \bar{C} if fused at 79° in cap. m.p. tube, and then allowed to cool slowly in the bath or rapidly in air, solidifies at 69° to a translucent cryst. mass which (if the temperature is immediately raised) melts at 74° but if allowed to remain at or below 69° for a few minutes becomes opaque and then melts at 79° (1).

[For prepn. of Č from 1-chloro-5-sulfonaphthylamine-2 [Beil. XIV-750] via diazotization and use of Cu₂Cl₂ reactn. see (1) (4); from 1-chloro-2-nitronaphthalenesulfonic acid-5 [Beil. XI-170] (3), 2-chloro-1-nitronaphthalenesulfonyl chloride-5 [Beil. XI-169] (3), 2-chloronaphthalene-1,5-bis-(sulfonyl chloride) [Beil. XI-213] (5), or 1,2-dichloronaphthalenesulfonic acid-5 [Beil. XI-163] (2) with PCl₅ see indic. refs.]

[Č treated with ClSO₃H in CS₂ and conv. to K salt as directed (1) gives a mixt. contg. 70% (less sol.) K 1,2,5-trichloronaphthalenesulfonate-X (corresp. sulfonyl chloride, m.p. 146°) and 30% (more sol.) K 1,2,5-trichloronaphthalenesulfonate-Y (corresp. sulfonyl chloride, m.p. 179°).]

3:1936 (1) Turner, Wynne, J. Chem. Soc. 1941, 247, 251-252. (2) Armstrong, Wynne, Chem. News 59, 188 (1889). (3) Cleve, Chem. Ztg. 17, 398 (1893). (4) Armstrong, Wynne, Proc. Chem. Soc. 1839, 36, 49. (5) Armstrong, Wynne, Chem. News 62, 164 (1890).

Colorless cryst. from alc.; 100 pts. 90% alc. dis. in cold 11.91 pts. \bar{C} , on boilg. 19.87 pts. \bar{C} (8). — \bar{C} is eas. sol. ether, CHCl₃, or CS₂; less so in alc. or C₆H₆.

PREPARATION OF C

[For prepn. of Č from 1,1,1-trichloro-2,2-diphenylethane (3:1420) by splitting out 1 HCl on distn. (9) cf. (10) (6), or with alc. KOH (2) (1) (for study of rate see (11)), or alc. NaOEt (1) see indic. refs.; from unsym.-diphenylethane [Beil. V-605, V₁-(285), V₂-(509)] with Cl₂ at 100-150° in quartz flask in light for 10 hrs. followed by distn. at ord. press. (16% yield) see (3); from unsym.-diphenylethylene [Beil. V-639, V₁-(308), V₂-(543)] with Cl₂ followed by distn. see (12).]

[For form. of $\tilde{\mathbb{C}}$ from α, α -dichloro- β, β -diphenylethylene sulfide ($\mathbb{C}l_2\mathbb{C}$ — $\mathbb{C}(\mathbb{C}_6\mathbb{H}_6)_2$) by

htg. at 100° for 2 hrs. (or for shorter time at 160°), or by boilg. with MeOH, or htg. with Zn see (13); from α,α -dichloro- β,β -diphenylethyl p-tolyl sulfone with PCl₅ at 200° for 2 hrs. see (4); for formn. of \tilde{C} during condensation of chloral (3:5210) with C_6H_6 + AlCl₅ in CS₂ see (10) (6).]

CHEMICAL BEHAVIOR OF C

Reduction. [\bar{C} on reduction with conc. HI + P at 170-210° gives (7) unsym.-diphenylethane [Beil. V-605, V₁-(285), V₂-(509)] and bibenzyl (1:7149).]

Addition of halogens. \tilde{C} with Cl_2 in dry CHCl₃ adds 1 mole halogen giving (6) (5) 1,1,1,2-tetrachloro-2,2-diphenylethane, m.p. $S5^{\circ}$ (6). — \tilde{C} with excess Br_2 htd. on aq. bath until excess reagt. evaporates gives (6) 1,2-dibromo-1,1-dichloro-2,2-diphenylethane, cryst. from alc., m.p. $120.0-120.5^{\circ}$ (6).

Behavior with alkalies. [\bar{C} with aq. NaOH at 150°, or with alc. NaOH in s.t. at 100°, is substantially unaffected within 24 hrs. (3); however, \bar{C} with alc. KOH in stainless-steel bomb at 150° for 24 hrs. gives (73% yield (3)) diphenylacetic acid (1:0765), m.p. 147-148° cor. (3) cf. (1). — Note also that, although \bar{C} with dry NaOMe in C_6H_6 does not react even in s.t. at 180° for 36 hrs. yet \bar{C} with dry NaOMe (2 moles) on direct distn. gives diphenylacetylene (tolane) and other products (15).]

[Note also that \tilde{C} with Na phenolate at 225° for 24 hrs. gives (3) α -hydroxy- α , α -diphenylacetaldehyde diphenylacetal (benzilaldehyde diphenylacetal), m.p. 111.5°-112° (3).]

Behavior with H_2SO_4 or HNO_3 . With H_2SO_4 . \bar{C} with conc. H_2SO_4 on warming first becomes yellow, then dark green, later violet, and ultimately brownish red. (5) (6).

With HNO₃. Č on addition to 12 pts. ice-cold fumg. HNO₃ and subsequently pouring onto ice gives (14) 1,1-dichloro-2,2-bis-(p-nitrophenyl)ethylene, yellowish ndls. from hot alc., m.p. 172° (14); note also that from the mother liquors of recrystn. there can also be obtd. some 4,4'-dinitrobenzophenone, m.p. 188-189°, resulting from some simultaneous oxidn. (14).

3:1938-3:1945 DIVISION A 250

Behavior with active metals. [C with Li in dry ether followed by treatment with alc. gives according to conditions (16) (17) (18) either or both 1,2,3-triphenylnaphthalene, m.p. 151-152° (16) (17) (18) (mononitro deriv., m.p. 200-201° (18)), and 1,2,3,4-tetraphenyl-butadiene-1,3, m.p. 183° (18) (17) (16); for explanation see (18).]

Chem. Soc. 63, 1184-1187 (1941).

Colorless cryst. from alc. — \bar{C} is eas. sol. alc., ether, acetone, AcOH, lgr., or CHCl₃. — \bar{C} with conc H₂SO₄ or with AlCl₃ gives a red color.

[For prepn. of \bar{C} from dichloroacetaldehyde diethylacetal (3:6110) with C_6H_6 + conc. H_2SO_4 (1) (5) (3) (yields not reported) see indic. refs.; for formn. of \bar{C} from dichloroacetaldehyde (3:5180) with C_6H_6 + AlCl₃ (6), or from 1,1,1-trichloro-2,2-diphenylethane (3:1420) during reduction in alc./pyridine with H_2 + Ni (7) or during electrolytic reduction as specified (8) (9) (2), see indic. refs.]

 \bar{C} on distn. at ord. press. (1) or with boilg. alc. KOH (1) or NaOH (2) loses HCl giving 1-chloro-1,2-diphenylethylene [Beil. V-639], m.p. 42°. — Note, however, that \bar{C} with KNH₂ in liq. NH₃ (3) (5) not only loses HCl but the resulting intermediate reacts further with rearrangement giving (91% yield) diphenylacetylene (tolane) [Beil. V-656, V₁-(319), V₂-(568)].

Č on boilg. with aq. is not hydrolyzed and no trace of the expected diphenylacetaldehyde results (1).

C on addition to fumg. HNO₃ at 0°, stdg. 24 hrs., and pouring into aq. gives (1) a dinitrobenzophenone of unknown structure (corresp. phenylhydrazone, m.p. 234° (1)).

3:1945 1,1,2,3,4,4-HEXACHLORO-BUTENE-2

(solid stereoisomer)

Cl Cl Cl Cl
$$C_4H_2Cl_6$$
 Beil. S.N. 11
$$HC-C=C-CH$$

M.P. 80° (1)

[See also liquid stereoisomer (3:9046).]

Colorless shining lfts. (from alc.) with camphoraceous odor. Eas. sol. ether, C_6H_6 , CHCl₃, or CCl₄.

[For prepn. of \bar{C} (100% yield (1)) from the solid stereoisomer (3:0870) of 1,2,3,4-tetra-chlorobutadiene-1,3 see (1); for formn. of \bar{C} from 1,1,2,2-tetra-chloroethane (acetylene tetra-chloride) (3:5750) by actn. of u.v. light see (1).] [Note that octa-chlorobutane (3:2000) has also been reported in same reactn.] [For formn. of \bar{C} together with its liquid stereo-isomer (3:9046) by actn. of Cl_2 upon the high-boilg, fraction obtd in the prepn. of tri-chloroethylene (3:5170) from 1,1,2,2-tetra-chloroethane (acetylene tetra-chloride) (3:5750) see (1).]

Č in alc refluxed with Zn/Cu couple for 1 hr. yields (1) the solid stereoisomer of 1,2,3,4-tetrachlorobutadiene-1,3 (3:0870), m.p. 50° (1).

3:1945 (1) Müller, Huther, Ber. 64, 589-600 (1931); C.A. 25, 3956-3957 (1931).

[For prepn. of \bar{C} from piperonylic acid (1:0865) with excess SOCl₂ at 100° (1) or in C_6H_6 (90–95% yield (4)), or with PCl₅ (2), see indic. refs. — Note, however, that at higher temps. the dioxymethylene group is also attacked: e g, piperonylic acid htd. in a s.t. with SOCl₂ at 180–200° for 8 hrs. (1) or refluxed 3 hrs. with 3 moles PCl₅ (1) yields μ,μ -dichloropiperonoyl chloride [Beil. XIX-272, XIX₁-(743)], b.p. 149–150° at 12 mm. (1).]

[C with diazomethane yields (3) piperonyl diazomethyl ketone which with ammonia yields (3) homopiperonylamide, m.p. 173°; C with ethyl sodio-acetoacetate in dry ether, followed by hydrolysis (as specified (4)) of the acetyl group, yields ethyl piperonoylacetate, m.p. 42.5° (4)]

C on hydrolysis with aq. yields piperonylic acid (1:0865), m.p. 228°.

- Deperonvlamide [Beil. XIX-270]: tbls. from alc., m p. 169°.
- ① Piperonylanilide [N-phenyl-piperonylamide]: cryst. from dil. alc., m.p. 146-147° cor. (5) [From $\tilde{C}+2$ moles aniline in C_6H_6 (5).]
- D Piperonylo-p-toluidide: cryst. from dil. alc., m.p. 149-149.5° cor. (5). [Similarly using p-toluidine (5).]
- D Piperonylo-α-naphthalide: cryst. from dil. alc., m.p. 192-193° cor. (5). [Similarly using α-naphthylamine (5).]
- Dependence Piperonylo-β-naphthalide: cryst. from dil. alc., m.p. 156.5–157° cor. (5). [Similarly using β-naphthylamine (5).]

M.P. 80-81°

See 3:2662 under anhydrous product.

3:1975 1,8,6-TRICHLORO-NAPHTHALENE

M.P. 80.5°-81° (1) (2)

[For prepn. of Č from 3,6-dichloronaphthalenesulfonyl chloride-1 (1), from 6-chloronaphthalene-1,3-bis-(sulfonyl chloride) [Beil. XI-212] (2), from 3-chloronaphthalene-1,6-bis-(sulfonyl chloride) [Beil. XI-214] (2), from 1-chloronaphthalene-3,6-bis-(sulfonyl chloride) [Beil. XI-217] (3), or from 1-nitronaphthalene-3,6-bis-(sulfonyl chloride) [Beil. XI-218] (1) (3) (4), each with PCl₅ as directed, see indic. refs.]

[C treated with CISO₃H in CS₂ and prod. converted to sodium salt yields (1) sodium 1,3,6-trichloronaphthalenesulfonate-7 (corresp. sulfonyl chloride, m.p. 156° (1)).]

3:1975 (1) Turner, Wynne, J. Chem. Soc. 1941, 247, 253, 256. (2) Armstrong, Wynne, Chem. News 62, 164-165 (1890). (3) Armstrong, Wynne, Chem. News 71, 254 (1895). (4) Armstrong, Wynne, Proc. Chem. Soc. 1895, 81.

3:1990 1,3-DICHLORONAPHTHOL-2

CI OH CI C₁₀H₆OCl₂ Beil. VI - 649

VI₁---VI₂-(604)

M.P. 80-81° (1) 78° (2)

Ndls. from lgr.; eas. sol. alc., ether, AcOH, or C6H6 (1).

[For prepn. see Beil. VI-649 and (2).]

 \bar{C} in AcOH oxidized with conc. HNO₃ (D=1.42) yields mainly 3-chloronaphthoquinone-1,2 [Beil. VII-720], red ndls. from CHCl₃, m.p. 172° (1).

 \bar{C} in alc. boiled 15 hrs. with coppered Zn dust yields 3-chloronaphthol-2 (3:2545), m.p. 93° (4); but \bar{C} is not reduced by Na/Hg (3).

[For study of reaction of C with alkali sulfites see (5).]

① 1,3-Dichloro-2-naphthyl acetate: from $\ddot{C} + AcCl$; m.p. 79-80° (1). [Note that this m.p. is close to that of original \ddot{C} .]

CHAPTER VI

DIVISION A. SOLIDS

(3:2000-3:2499)

3:2000 1,1,2,2,3,3,4,4-OCTA-CHLOROBUTANE

C₄H₂Cl₈ Beil. S.N. 10

M.P. 81° (1)

Colorless cryst. from alc. with odor resembling honey.

[For formn. of \bar{C} from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) by protracted action of ultra-violet light see (1); considerable amts. of dichloroacetic acid (3:6208), m.p. 10.85°, and small amts. of oxalic acid (1:0445) are also formed (1), and the solid stereoisomer (3:1945) of 1,1,2,3,4,4-hexachlorobutene-2, m.p. 81° has also been reported (3) from the same reaction.]

[An octachlorobutane of m.p. 75.0-76.0° obtd. (2) from trichloroethylene (3:5170) by actn. of F_2 is not regarded (2) as having the structure of \tilde{C} .]

3:2000 (1) Müller, Luber, Ber. 65, 985-987 (1932). (2) Miller, J. Am. Chem. Soc. 62, 343 (1940). (3) Müller, Hüther, Ber. 64, 599 (1931).

3:2100 2,4,5-TRICHLOROTOLUENE

$$\begin{array}{cccc} CH_3 & C_7H_5Cl_3 & \textbf{Beil. V - 299} \\ & & & & & & & & \\ Cl & & & & & & & \\ Cl & & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & \\ & & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & \\ & & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & \\ & & & & \\ & & \\ & & & \\ & & \\ & & & \\ & & & \\ & & & \\ & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & \\ & & & \\ & & & \\ & & & \\ & & \\ & & & \\ & & \\ & & & \\ & & \\ & & \\ & & & \\ & & \\ & & & \\ & &$$

White ndls. or lfts. from alc. [For sepn. of \bar{C} from 2,3,4-trichlorotoluene (3:0425) by sulfonation of latter under conditions not affecting \bar{C} see (2) (7).]

[For prepn. of \bar{C} from 4,5-dichloro-2-aminotoluene [Beil. XII-837] (8), or from 4,6-dichloro-3-aminotoluene [Beil. XII-872] (8) (5), or from 2,5-dichloro-4-aminotoluene [Beil. XII-990] (3), via dizactization and use of Cu_2Cl_2 reactn. see indic. refs.; from toluene + AlCl₃ with SO_2Cl_2 at 70° (40% \bar{C} + 34% 2,3,4-trichlorotoluene (3:0425) (1)) see (1).]

[For formn. of \bar{C} (together with other products) from toluene with Cl₂ (9) in pres. of I₂ (10) or MoCl₅ (11) or FeCl₃ (11) on silica gel (4), or by electrolysis in HCl/AcOH soln. (12), see indic. refs.; from o-chlorotoluene (3:8245) or p-chlorotoluene (3:8287) with Cl₂ in pres. of MoCl₅ or FeCl₃ see (2); from 2,4-dichlorotoluene (3:6290) in pres. of Al/Hg

(13) or Fe (6) or from 3,4-dichlorotoluene (3:6355) in pres. of Al/Hg (13) see indic. refs.; from sodium p-toluenesulfonate with Cl_2 see (14).]

[\bar{C} with Cl_2 yields (15) 2,4,5-trichlorobenzal dichloride (3:6910) (together with other products).]

 \bar{C} on mononitration, e.g., by soln. inHNO₃ (D=1.52) yields (16) (2) (8) 2,4,5-trichloro-3-nitrotoluene [Beil. V-333], ndls. from alc., m.p. 92° (2), 91-92° (8), 88.5-90.5° (17), 88.5° (16) (note that the isomeric 2,4,5-trichloro-6-nitrotoluene (prepd. indirectly (18)) has m.p. 93-94° (18)); \bar{C} on dinitration, e.g., on warming with a mixt. of HNO₃ (D=1.5) + conc. H₂SO₄, yields (16) (2) (8) 2,4,5-trichloro-3,6-dinitrotoluene [Beil. V-346], ndls. from alc., m.p. 227° (1) (2), 226-227° (8), 226° u.c. (18), 225° (16).

 \ddot{C} on oxidn. with $K_2Cr_2O_7 + H_2SO_4$ (19) or with dil. HNO₃ in s.t. at 150° (8) (6) yields 2,4,5-trichlorobenzoic acid (3:4630) q.v.

3:2115 5-CHLORO-2,3-DIMETHYL- OII
$$C_8H_9OCl$$
 Beil. VI — PHENOL (5-Chloro-o-3-xylenol) CI CH_3 VI $_2$ -(454)

Ndls. from hot lt. pet. in which it is readily sol. hot but spar. sol. cold. — Volatile with steam.

[For prepn. of \bar{C} from 5-amino-2,3-dimethylphenol (5-amino o-3-xylenol) [Beil. XIII₁-(244)] (3) via diazotization and use of Cu₂Cl₂ reaction (yield not stated) see (2), for formn. of \bar{C} from 4,5-dichloro-1,1-dimethylcyclohexen-5-one-3 on htg. see (1).]

C with Cl₂ in lt. pet. gives (2) 4,5,6-trichloro-2,3-dimethylphenol (3:4742), m.p. 180-181°.

The nitration of $\tilde{\mathbf{C}}$ has not been reported, and none of the products to be expected is known.

- --- 5-Chloro-2,3-dimethylphenyl acetate: unreported.
- D 5-Chloro-2,3-dimethylphenyl benzoate: pr. from alc., m p. 88° (2).

3:2115 (1) Hinkel, J. Chem. Soc. 125, 1852 (1924). (2) Hinkel, Collins, Ayling, J. Chem. Soc. 123, 2970-2971 (1923). (3) Crossley, J. Chem. Soc. 103, 2181 (1913).

3:2125 1.2.3-TRICHLORONAPHTHALENE

$$\begin{array}{c|c} Cl & C_{10}H_{\delta}Cl_{3} & \text{Beil. V - 544} \\ \hline & & V_{1}- \\ \hline & & V_{2}- \\ \end{array}$$

Pr. from ether + alc. — The behavior of \tilde{C} on fusion is characteristic: if the fused \tilde{C} in a m.p. tube is allowed to cool to 68° and then withdrawn, it immediately solidifies to a translucent mass which on swift reimmersion into the bath shows m.p. 66-67° but if left for a few seconds in the air suddenly becomes opaque forming a cylinder of m.p. 82-83°, retracted from the wall of the capillary m.p. tube. This change (although slower) also occurs in the translucent form if cooled below 66° (1).

[For prepn. of \bar{C} from 1-chloronaphthalene tetrachloride [Beil. V-493] with alc. NaOEt (61.6% yield (1)) (2) (3) see indic. refs.; from 1,3-dichloronaphthol-2 (3:1990) by distn. with PCl₅ see (2); from sodium 1,2,3-trichloronaphthalenesulfonate-7 (1) by hydrolysis with superhtd. steam see (1).]

- [C treated with ClSO₃H in CS₂ and reactn. prod. conv. to sodium salt as directed (1) gives mixt. of sodium 1,2,3-trichloronaphthalenesulfonate-5 (corresp. sulfonyl chloride, m.p. 131°, corresp. sulfonamide, m.p. 249°) and sodium 1,2,3-trichloronaphthalenesulfonate-7 (corresp. sulfonyl chloride, m.p. 157°, corresp. sulfonamide, m.p. 245°) (1).]
- [Č with 7 pts. fumg. H₂SO₄ (10% SO₃) shaken 15 min. at 100° yields (1) 1,2,3-trichloro-naphthalene-5,7-disulfonic acid (corresp. bis-(sulfonyl chloride), m.p. 184° (1)).]
- 3:2125 (1) Turner, Wynne, J. Chem. Soc. 1941, 248-251. (2) Faust, Saame, Ann. 160, 71 (1871). (3) Armstrong, Wynne, Chem. News 61, 285 (1890).

3:2145
$$\beta_1\beta_2$$
-DICHLORO- α -HYDROXYISO- CH₃ C₄H₆O₃Cl₂ Beil. III - 317 BUTYRIC_ACID Cl₂CH—C—COOH III₁— III₂-(224)

M.P. 82-83° (1) (2) Neut. Eq. 173

Pr. from EtOH/ether (1). - Cannot be distd. without decompn. but sublimes.

[For prepn. from β,β -dichloro- α -hydroxyisobutyronitrile (addn. prod. from α,α -dichloroacetone (3:5430) + HCN) [Beil. I-317] by digestion with strong HCl at 100° see (1).]

The corresp. anilide has been prepd. indirectly by interaction of phenyl isocyanide with α,α -dichloroacetone (3:5430) in aq. (2); pr. from CHCl₃, m.p. 132-133° (2).

3:2145 (1) Bischoff, Ber. 8, 1334 (1875). (2) Passerini, Gazz. chim. ital. 54, 540 (1924).

Microscopic ndls. from alc. (1) (6) or n-PrOH (2); spar. sol. alc. (1), pet. ether (6), eas. sol. C_6H_6 (6).

[For prepn. from m-chlorobenzoyl chloride (3:6590) + C_6H_6 + AlCl₃ (64.7% yield (2)) see (2) (1) (6) (5).]

 \bar{C} on reduction with Na/Hg + alc. (100% yield (7)) or Al/Hg + 80% alc. (4) or boilg. alc. KOH (8) yields exclusively 3-chlorodiphenylcarbinol [Beil. VI₁-(327)], m.p. 40° (7), 39-40° (5), 38° (4). — \bar{C} with Zn + AcOH (7) or \bar{C} in alc. on long exposure to sunlight (7) gives sym.-3,3'-dichlorobenzpinacol [Beil. VI₁-(523)], cryst. from pet. eth., m.p. 137-138° (7), 135° (4).

C fused for 3 hrs. at 200° with a mixt. of KOH + NaOH gives (3) BzOH (1:0715) (80% yield (3)) and a little (5% (3)) m-chlorobenzoic acid (3:4392), m.p. 158° (3), together with chlorobenzone (3:7903) from cleavage of most of the m-chlorobenzoic acid

Č with CH₃MgI yields (2) 1-(m-chlorophenyl)-1-phenylethylene, oil, b.p. 152-153° at 14 mm. (2).

- **3-Chlorobenzophenone oxime:** from \bar{C} + NH₂OH.HCl + alk.; the two stereoisomers are sepd. by fractnl. pptn. of their AcOH soln. with aq. (1).
- a-form (less-sol. isomer); cryst. pdr., m p. 132-133° (1). [With PCl₅ in dry ether, followed by aq., this form yields m-chlorobenzanilide [Beil. XII-267], cryst. from alc., m.p. 122-125° (1).]
- β-form (more-sol. isomer); cryst. pdr., m.p. 105-106° (1). [With PCl₅ in dry ether, followed by aq., this forms benz-m-chloroanilide [Beil. XII-605], ndls from alc., m.p. 118° (1), accompanied by some m-chlorobenzanilide (see above) (1).]
- 3:2160 (1) Hantzsch, Ber. 24, 57-58 (1891). (2) Bergmann, Bondi, Ber 64, 1477 (1931). (3) Lock, Rödiger, Ber. 72, 867 (1939). (4) Cohen, Böeseken, Rec. trav. chim. 38, 115, 123 (1919). (5) Norris, Blake, J. Am. Chem. Soc. 50, 1812 (1928). (6) Koopal, Rec. trav. chim. 34, 153 (1915). (7) Ref. 6, pp. 160-161. (8) Montagne, van Charante, Rec. trav. chim. 31, 312 (1912)

M.P. 83° (1) B.P. 117-118° at 13 mm. (5 82° (2) 81-82° (3) (4)

White cryst., eas. sol. ether or AcOH, can be recrystallized from pet. ether (1) or from hot aq. (5). — \bar{C} distils under reduced press. without decomposition (5). — Note that m.p. 76.7-77.5° first reported (5) was later (2) found to be erroneous and same sample had actually m.p. 81-82° (2).

Note that, although $\bar{\mathbf{C}}$ is capable of existing in two geometrically isomeric forms, only this one is known; collateral evidence (but not actual proof) indicates that $\bar{\mathbf{C}}$ probably represents the *trans* stereoisomer.

[For prepn. of \tilde{C} from ethyl γ -chlorocrotonate (3:8657) by hydrolysis with Ba(OH)₂ below 0° (60% yield (1) (6)) (4), or less advantageously with 30% aq. KOH in alc. soln. at -15° (40% yield (1)) (5) (note that γ -chlorovinylacetic acid, m.p. 10° (1), is often obtd. (1) (4) as by-prod.); for formn. of \tilde{C} from β - γ -dichloro-n-butyric acid [Beil. II-280] with KOH (poor yield (5)), from trans- γ -hydroxycrotonic acid [Beil. III-376] with SOCl₂ in pyridine (2), or from methyl α -chloro- α -vinylacetate by hydrolysis (3) (7) (presumably as a result of allylic transposition of α -chloro- α -vinylacetic acid under the influence of alkali) see indic. refs.]

Č dissolved in excess aq. 1 N NaOH and shaken with H₂ in pres. of Pd/activated carbon is readily dehalogenated giving (95% yield (1)) crotonic acid (1:0425); with sufficient H₂ this prod. ultimately reduces to n-butyric acid (1:1035).

[\bar{C} by cat. hydroxylation with BaClO₃/osmic acid gives (yields: 75% (6), 78% (9)) threo- γ -chloro- α,β -dihydroxy-n-butyric acid, m.p. 100° (9); this prod. with silver oxide as directed replaces Cl by OH giving (59% yield (6)) d_i -threonic acid, m.p. 98° (6).]

 \tilde{C} adds $\tilde{B}r_2$ (1 mole) yielding (3) γ -chloro- α,β -dibromo-n-butyric acid, cryst. from cyclohexane, m.p. 119–120° (3).

 \bar{C} with NaI in dry acetone ppts. NaCl and gives (86% yield (1)) γ -iodocrotonic acid, yel. ndls. from lgr., m.p. 108-108.5° (1).

[C̄ on neutralization with NH₄OH and htg. with (NH₄)₂SO₃ at 50° for 12 hrs. gives (4) γ-sulfocrotonic acid, very hygroscopic cryst., m.p. 94–96°.]

The acid chloride corresponding to $\bar{\mathbf{C}}$ is unreported.

- Methyl γ -chlorocrotonate: unreported.
- Ethyl γ -chlorocrotonate: b.p. 191–193° at 760 mm. (5) (see 3:8657).
- γ-Chlorocrotonamide: cryst. from hot aq., m.p. 135.5-136° (8), 130-132° (5). [Reported only by partial hydrolysis of γ-chlorocrotononitrile (5) (8).]
- —— γ-Chlorocrotonanilide: unreported.

 \tilde{C} with 50% aq. KOH at 100° for 5 hrs. under N₂ undergoes cleavage of the aldehyde group giving (88% yield (3)) 1,2,4-trichlorobenzene (3:6420) and the corresp. potassium formate.

Č with anhydrous NaOAc + Ac₂O on htg. (Perkin synthesis) gives (64-68% yield (5)) 2,3,6-trichlorocinnamic acid, cryst. from AcOH, m.p. 189°.

[C with MeMgI in dry ether, followed by usual hydrolysis, gives (85% yield (2)) methyl-2,3,6-trichlorophenyl-carbinol, m.p. 87-88°, b.p. 149-155° at 11 mm. (corresp. benzoate, m.p. 106.5°).]

- ---- 2,3,6-Trichlorobenzaldoxime: unreported.
- ---- 2,3,6-Trichlorobenzaldehyde phenylhydrazone: unreported.
- ---- 2,3,6-Trichlorobenzaldehyde p-nitrophenylhydrazone: unreported.
- ----- 2.3.6-Trichlorobenzaldehyde 2.4-dinitrophenylhydrazone: unreported.

3:2287 (1) Geigy and Co., Ger. 199,943, July 4, 1908; Cent. 1908, II 363-364; C.A. 2, 3000 (1908); (2) Lock, Böck, Ber. 70, 924 (1937). (3) Lock, Ber. 66, 1531 (1933). (4) Asinger, Lock, Monatch. 62, 338 (1933). (5) Böck, Lock, Schmidt, Monatch. 64, 408 (1934).

3:2290 PENTACHLOROBENZENE

Long colorless ndls. from alc.; volatile with steam; sublimes readily. — Almost insol. cold alc., apprec. sol. boilg. alc.; eas. sol. ether, C₆H₆, CHCl₃, CCl₄, or CS₂; spar. sol. conc. HNO₃.

[For prepn. of \bar{C} from nonachlorobenzophenone-o-carboxylic acid [o-(pentachlorobenzoyl)-tetrachlorobenzoic acid] [Beil. X₁-(358)] by htg. with 10 pts. conc. H₂SO₄ at 200-250° for ½ hr. (simplest prepn. of pure \bar{C}) see (12); for formn. of \bar{C} from 2,3,4,5,6-pentachloroacetophenone (6) or 2,3,4,5,6-pentachlorobenzophenone (11) by KOH/NaOH fusion see indic. refs.; from 2,3,4,5,6-pentachlorobenzaldehyde (3:4892) (2) by htg. with 50% aq. KOH 5 hrs. at 100° (88% yield) see (2).]

[For prepn. of C from 2,3,5,6-tetrachloroaniline (7) via diazotization and use of Cu₂Cl₂ reactn. see (7); from 2,3,5-trichloro-p-phenylenediamine via tetrazotization in AcOH with nitrosylsulfuric acid and use of Cu₂Cl₂ reactn. (80% yield) see (3).]

[For formn. of \bar{C} from benzene with Cl_2 (7), or $Cl_2 + cat$. (20), or Cl_2 in pres. of I_2 (18), or $AlCl_3$ (19) see indic. refs.; from chlorobenzene with $Cl_2 + Cu$ at 200° see (21); from 1,3,5-trichlorobenzene (3:1400) with $Cl_2 + Al/Hg$ see (17); from all three tetrachlorobenzenes with $Cl_2 + Al/Hg$ see (17); from 1,2,4,5-tetrachlorobenzene (3:4115) in $SOCl_2$ or CCl_4 with $SO_2Cl_2 + AlCl_3 + S_2Cl_2$ see (8) (note that under these circumstances p-dichlorobenzene (3:0980) gives a mixt. of tetra and hexachlorobenzenes (8) (22)); from lower chlorinated derivs. of benzene by htg. with $FeCl_3$ see (5); from diphenyl sulfone with Cl_2 in sunlight followed by treat. with alc. KOH see (13) (23); from tetrachlorobenzyl chloride with Cl_2 see (16); from acet-N-nitro-2,3,5,6-tetrachloroaniline on htg. in toluene or from parent base on attempted acetylation see (15); from trichloroethylene (3:5170) at 700° see (9); from iodopentachlorobenzene with MeOH/NaOH see (1).

[For form. of \bar{C} from various chlorine addition products derived from o-dichlorobenzene (3:6055) (4), m-dichlorobenzene (3:5960) (4), p-dichlorobenzene (3:0980) (4), 1,2,4,5-tetrachlorobenzene (3:4115) (24), and even \bar{C} itself (25) see indic. refs.]

[C with liq. Cl₂ in s.t. in sunlight adds 2 Cl₂ with considerable sluggishness yielding (26) (25) a mixt. of two stereoisomeric nonachlorocyclohexenes.]

[C with fumg. H₂SO₄ gives on protracted htg. (27) a red dyestuff, sol. in alk. with deep red color.]

[C with N/2 NaOMe in MeOH in s.t. at 180° for 7½ hrs. gives (7) 2,3,5,6-tetrachlorophenol, m.p. 115° (7) (benzoate, m.p. 136° (28)), accompanied by a small amt. 2,3,4,5-tetrachlorophenol, itself not obtd. pure but yielding (28) a benzoate of m.p. 110° (28). — [For further study of actn. of MeOH/NaOH on C see (29) (30).]

 \bar{C} on nitration, e.g., with 7-8 wt. pts. HNO₃ (D=1.52) at 100° for 1 hr. (7), gives (7) (9) (18) (31) pentachloronitrobenzene [Beil. V-247], ndls. from alc., tbls. from CS₂, m.p. 146° (9) (18) (31), 143° (7); note that since \bar{C} is spar. sol. in conc. HNO₃ any unchanged material may separate with the crude prod. (31). — [This pentachloronitrobenzene with

N/10 NaOMe in MeOH boiled for 8 hrs. loses NO₂ instead of Cl yielding (31) methyl pentachlorophenyl ether (pentachloroanisole), m.p. $104-105^{\circ}$ (31); cf. also under pentachlorophenol (3:4850).]

3:2295 PENTACHLOROBENZOYL CHLORIDE

M.P. 87° (1)

Colorless tbls. from hot alc.

[For prepn. of C from *unsym.*-tetrachlorophthalyl (di)chloride (3,3,4,5,6,7-hexachlorophthalide) [Beil. XVIII₁-(484)] on htg. at 300° in pres. of Cl₂ see (1)]

C during protracted htg loses CO yielding (1) hexachlorobenzene (3:4939) (this type of decompn. is generally facilitated by AlCl₃ although in this case this aspect has not been reported).

Č with MeOH on refluxing for 30 hrs. gives (1) methyl pentachlorobenzoate m.p. 97° (1); note that esterification is slow and that Č can be recrystallized from EtOH without change.

Č on hydrolysis with alc. KOH, followed by acidification, yields (1) pentachlorobenzoic acid (3:4910).

3:2295 (1) Kirpal, Kunze, Ber. 62, 2104-2105 (1929).

3:2300 TRICHLOROPARALDEHYDE

(Chloroacetaldehyde trimer; 2,4,6-tris-(chloromethyl)trioxane-1,3,5)

C₆H₉O₃Cl₃

Beil. XIX - 386

XIX1-(807)

M.P. 87-87.5° cor. (1) B.P. 142-144° at 10 mm. (2) 140° at 10 mm. (1)

Colorless ndls. from ether; insol. aq., spar. sol. cold alc., eas. sol. hot alc. or in ether.

[For prepn. of \bar{C} from chloroacetaldehyde (3:7212) (or its hydrate) with $\frac{1}{2}$ vol. cold conc. H_2SO_4 see (1) (3) (4).]

C on distn. at ord. press. (1) (2) (3) (4) depolymerizes to monomeric chloroacetaldehyde (3:7212), b.p. 85°.

3:2300 (1) Natterer, Monatsh. 3, 459-464 (1882). (2) Späth, Monatsh. 36, 6-7 (1915). (3) Helferich, Speidel, Ber. 54, 2634-2635 (1921). (4) Lespieau, Bull. soc. chim. (4) 43, 200-201 (1928).

3:2325 1,2,7-TRICHLORONAPHTHALENE

M.P. 88° also 84° (1) (2) (See Text)

C shows the double m.p. behavior indicated also for several of its isomers, e.g., 1,2,3-isomer (3:2125), 1,2,5-isomer (3:1930), 1,3,8-isomer (3:2420), 1,4,6-isomer (3:1625).

[For prepn. of C from 1-chloro-7-sulfonaphthylamine-2 [Beil. XIV-765] via diazotization and use of Cu₂Cl₂ reactn. see (1) (2); from 1,2-dichloronaphthalenesulfonyl chloride-2 [Beil. XI-184] (2) (3), from 1-chloro-7-nitronaphthalenesulfonyl chloride-2 [Beil. XI-188] (4), from 2-chloro-1-nitronaphthalenesulfonyl chloride-2 [Beil. XI-189] (5) (2), or from 1-chloronaphthalene-2,7-bis-(sulfonyl chloride) [Beil. XI-217] (2), each with PCl₅ as directed, see indic. refs.]

[C treated with CISO₃H in CS₂ and reactn. prod. conv. to sodium salt as directed (1) yields sodium 1,2,7-trichloronaphthalenesulfonate-X (corresp. sulfonyl chloride, m.p. 176° (1)).]

3:2325 (1) Turner, Wynne, J. Chem. Soc. 1941, 247, 252. (2) Armstrong, Wynne, Chem. News 71, 253-254 (1895). (3) Armstrong, Wynne, Chem. News 59, 189 (1889). (4) Cleve, Chem. Ztg. 17, 398 (1893). (5) Cleve, Ber. 25, 2486-2487 (1892).

3:2340 2,5-DICHLOROBENZOPHENONE

(2,5-Dichlorophenyl phenyl ketone)

M.P. 88° (1) (3) 85-86° (2)

Cryst. (from alc. (1)). — C does not form a NaHSO3 cpd. (1).

[For prepn. (20% yield (1)) from p-dichlorobenzene (3:0980) + BzCl (3:6240) + AlCl₃ see (1) (2).]

 \bar{C} fused for 3 hrs. at 200° with a mixt. of KOH + NaOH gives (3) p-dichlorobenzene (3:0980) (65% yield (3)) and BzOH (1:0715) (91% yield (3)).

C on oxidn. with KMnO4 soln. yields (1) 2,5-dichlorobenzoic ac. (3:4340), m.p. 150° (1).

D 2,5-Dichlorobenzophenone oxime: from C in alc. on htg. with NH₂OH.HCl + BaCO₃ for 3 days (10% yield (1)); m.p. 135° (on rapid htg.), 207° (on slow htg.) (1). [This

oxime upon Beckmann rearr. with 10 pts. conc. H₂SO₄ at 100° for 1 hr. gives benz-2,4-dichloroanilide, m.p. 122° (1).]

3:3340 (1) de Crauw, Rec. trav. chim. 50, 767-768 (1931). (2) Ganzmüller, J. prakt. Chem. 138, 311-312 (1933). (3) Lock, Rödiger, Ber. 72, 869 (1939).

3:2360 2,3,5,5,6,6-HEXACHLORO-CYCLOHEXENE-2-DIONE-1,4

M.P. 89° (1) B.P. 275-285° dec. (1) 86-87° (2) 182-185° at 45-50 mm. (1)

Cryst. (from ether/pet. ether). — Lachrymatory odor. — Eas. volatile with steam; on distn. at atm. press. dec. into chloranil (3:4978) and Cl₂. — Eas. sol. ether, CHCl₃; fairly eas. sol. alc., C₆H₆, lgr.; insol. aq.

[For prepn. from chloranil (3:4978) by treatment with $MnO_2 + conc.$ HCl in s.t. for 10 hrs. at 180° see (1); from p-aminophenol hydrochloride in AcOH on treatment with Cl_2 see (1).]

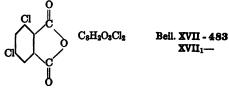

[For use of C as fungicide see (3).]

Č with KI in AcOH yields (1) chloranil (3:4978). — Č on reduction with SnCl₂ yields (1) tetrachlorohydroquinone (3:4941).

Č on shaking with 10% aq. NaOH slowly dissolves with decompn. into dichloromaleic acid, trichloroethylene, and HCl (1).

3:2360 (1) Zincke, Fuchs, Ann. 267, 15-24 (1892). (2) Theilacker, Ber. 71, 2069 (1938). (3) Ladd (to U.S. Rubber Co.), U.S. 2,362,565, Nov. 14, 1944; C.A. 39, 2832 (1945).

3:2375 3,5-DICHLOROPHTHALIC ANHYDRIDE

M.P. 89° (1) (2)

[See also 3,5-dichlorophthalic acid (3:4580).]

Ndls. from lgr.; eas. sol. ether, C6H6, CHCl3.

[For prepn. from 3,5-dichlorophthalic acid (3:4580) by htg. alone (2), or with AcCl (1), see indic. refs.; from 3,5-disulfophthalic anhydride (2) with SOCl₂ in s.t. 11 hrs. at 180° see (2).]

 \tilde{C} htd. with resorcinol + a drop of conc. H₂SO₄, then dislvd. in alk. and diluted, gives brilliant greenish fluorescence (1).

[C with hydroquinone (1:1590) + AlCl₃ + NaCl htd. at 200-220° for 40 min. gives (3) 5,7-dichloro-1,4-dihydroxyanthraquinone (5,7-dichloroquinizarin), red ndls. from xylene, m.p. 231-232° (3).]

[Č with steam passed over cat. at 380-420° loses CO₂ presumably yielding (4) 2,4-dichlorobenzoic acid (3:4560) and /or 3,5-dichlorobenzoic acid (3:4840).

Č on melting and treatment with dry NH₃ gas yields (1) 3,5-dichlorophthalimide [Beil. XXI-504], yel. ndls. from hot alc., m.p. 208° (1); Č on htg. with 1 mole aniline until evoln. of gas stops gives (1) 3,5-dichlorophthalanil [Beil. XXI-504], yel. ndls. from alc., m.p. 150.0-150.5° (1).

 \tilde{C} is insol. in cold aq. but hydrolyzes on boilg.; \tilde{C} on sapon. with standard alk. (Sap. Eq. = 108.5) followed by acidifn. yields 3,5-dichlorophthalic acid (3:4840) q.v.

3:2375 (1) Crossley, LeSueur, J. Chem. Soc. **81**, 1536-1537 (1902). (2) Waldmann, Schwenk, Ann. **487**, 293-294 (1931). (3) Waldmann, J. prakt. Chem. (2) **130**, 99-100 (1931). (4) Jaeger (to Selden Co.), U.S. 1,964,516, June 26, 1934; Cent. **1934**, II 3047.

3:2395 unsym.-o-PHTHALYL DICHLORIDE (unsym.-o-Phthaloyl dichloride; 3,3-dichlorophthalide) C C₈H₄O₂Cl₂ Beil. IX - 805 XVII₁-(162)

[See also sym.-o-phthalyl dichloride (3:6900).]

M.P. 89° (1)
$$D_4^{99.6} = 1.3320$$
 (6) $D_4^{50} = 1.351$ (5) $D_4^{50} = 1.351$ (5) $D_4^{50} = 1.351$ (6) $D_4^{50} = 1.351$ (7) $D_4^{50} = 1.351$ (8) $D_4^{50} = 1.351$ (9) $D_4^{50} = 1.351$ (10) $D_4^{50} = 1.351$

Prisms from C_6H_6 (2), cryst. from pet eth. (b.p. $20-50^\circ$) (4). — \bar{C} is much less reactive but far more lachrymatory (7) than sym.-o-phthalyl dichloride (3:6900). — The m.p. of \bar{C} is not sharp because of beginning of conversion to sym. isomer (4) (5), and \bar{C} shows progressive change of density when kept at 90° for 1 hr. (5). — \bar{C} on distillation is converted to the sym. isomer and therefore shows b.p. of the latter; this change is accelerated by presence of AlCl₃ or SnCl₄ (1) (2) or by HCl. — \bar{C} should therefore be preserved in a desiccator over soda-lime (2). — For f.p./compn. diagram of \bar{C} with its sym. isomer see (3); the eutectic has m.p. +8° and conts 23% \bar{C} .

[For prepn. of \bar{C} from sym.-o-phthalyl dichloride by htg. with AlCl₃ at 100° for 8-10 hrs. (72% yield) see (4).]

 \bar{C} in anhydrous formic acid reacts below 40° evolving HCl + CO (7) (the sym. isomer reacts much more readily, even below 25° (7)).

Č on shaking at 0° with 10 vols. 7% aq. NH₄OH followed by acidification yields (1) (7) o-cyanobenzoic acid [Beil. IX-814, IX₁-(365)], m.p. 190° dec., converted by htg. to phthalimide, m.p. 228.5° u.c. [Exactly this same result is obtd. with the sym. isomer.]

[For studies of rate of reactn. of C with MeOH or with aniline see (2) (8).]

[For differentiation of \bar{C} from its sym. isomer by use of piperidinium N-piperidyldithio-carbamate (from piperidine + aq. + CS_2) see (6) (7).]

270

Ndls. from alc. in which it is eas. sol — Note that \bar{C} (like certain of its isomers) shows a peculiar characteristic; if the fused \bar{C} in a m.p. tube is allowed to cool and withdrawn it solidifies to a translucent form which on immediate reheating shows m.p. 84-85° but if left for a time is conv to an opaque mass which on htg. shows m.p. 89°.

[For prepn. of \bar{C} from 1-chloronaphthalene-3,8-brs-(sulfonyl chloride) [Beil. XI-214] with PCl₅ see (1) (3); from 1-nitronaphthalene [Beil. V-553, V₁-(264)] with Cl₂ see (4) (2)]

[C treated with ClSO₃H in CS₂ and prod. conv. to sodium salt yields (1) sodium 1,3,8-trichloronaphthalenesulfonate-5 (corresp. sulfonyl chloride, m.p. 127° (1)).]

3:2420 (1) Turner, Wynne, J. Chem. Soc. 1941, 247, 254. (2) Armstrong, Wynne, Chem. News 71, 255 (1895). (3) Armstrong, Wynne, Chem. News 61, 94 (1890). (4) Atterberg, Ber. 9, 926 (1876).

Cryst. from alc. or hexane. — Volatile with steam.

[For prepn. of Č from 1,8-diaminonaphthalene [Beil. XIII-205, XIII₁-(54)] via tetrazotization and htg. with Cu₂Cl₂ (59% yield) see (1); from 8-chloronaphthylamine-1 [Beil. XII-1256] via diazotization and use of Cu₂Cl₂ reactn. (52% yield (7)) (2) (6) see indic. refs.; from 1,8-dinitronaphthalene [Beil. V-559, V₁-(265)] with PCl₅ see (5) (11); from 8-chloronaphthalenesulfonyl chloride-1 [Beil. XI-162] by htg. at 200–230° as long as SO₂ is evolved see (4); from 4,5-dichloronaphthalenesulfonic acid-1 [Beil. XI-162] by hydrolytic cleavage of —SO₃H group at 230° see (9) (3); from K salt of 4,5-dichloronaphthalenesulfonic acid-2 [Beil. XI-182] by htg. with 1% H₂SO₄ or 50% H₃PO₄ in s.t. at 290° see (9).]

Č htd. with HCl in s.t. at 250-290° rearranges (9) to 1,5-dichloronaphthalene (3:3200), m.p. 107°.

[C in CS₂ treated with ClSO₃H yields (10) 1,8-dichloronaphthalenesulfonic acid-4 [Beil. XI-162] (corresp. sulfonyl chloride, m.p. 114° (10), corresp. sulfonamide, m.p. 228° (10)).]

3:2438 1,1-DICHLORO-2,2-bis-(p-CHLOROPHENYL)-ETHYLENE

C₁₄H₈Cl₄ Beil. S.N. 480

M.P. 89° (1)

88-89° (2)

86-87° (3)

Colorless cryst. from alc.

[For prepn of C from 1,1,1-trichloro-2,2-bis-(p-chlorophenyl)ethane ("DDT") (3:3298) by elimination of 1 HCl with alc KOH under reflux (1) for 10 hrs. (3) or 15-20 min. (4) (yields: almost 100% (4), 81% (3)) (for study of rate see (5)), or by htg. at 110-120° with a trace of FeCl₃ or AlCl₃ (2), see indic. refs.; for prepn. of C from 1,1,1,2-tetrachloro-2,2-bis-(p-chlorophenyl)ethane (3.2477) by elimination of two adjacent chlorine atoms with Zn dust in boilg. abs. alc refluxed 8 hrs. (66% yield) see (3)

Č on oxidn. with CrO₃/AeOH refluxed 4 hrs. gives (100% yield (3)) 4,4'-dichlorobenzo-phenone (3:4270), m.p. 144° (3).

 \bar{C} in boilg. CHCl₃ contg. a little PCl₃ with Cl₂ for 3 hrs. (but without special radiation) adds 1 mole halogen giving (70% yield (3)) 1,1,1,2-tetrachloro-2,2-bis-(p-chlorophenyl)-ethane (3:2477), m.p. 91-92° (3).

 \bar{C} with KOH in ethylene glycol refluxed 10–12 hrs. gives (almost 100% yield (4)) 4,4'-dichlorodiphenylmethane (3·1057) m.p. 55°; but note that \bar{C} with excess Ba(OH)₂.8H₂O in ethylene glycol refluxed 10–12 hrs. (4) or \bar{C} with alc KOH in st at 150–160° for 24 hrs. (7) gives (yields 57% (7), 33% (4)) di-(p-chlorophenyl)acetic acid (3:4612), m.p. 166.0–166 5° u.c. (4), 163–164° (7), this acid undoubtedly being the precursor which by loss of CO₂ with the above KOH gives the indicated prod.

 \bar{C} with anhydrous AlCl₃ in large excess C_6H_6 does not (6) give 1,1,2,2-tetraphenylethane (dif. from "DDT" (3:3298) q v)

3:2438 (1) Zeidler, Ber. 7, 1181 (1874).

3:2440 3,4,5-TRICHLOROBENZALDE-HYDE

C₇H₃OCl₃ Beil. S.N. 635

Colorless ndls. from alc. — Somewhat sol. boilg. aq.; volatile with steam. — Eas. sol. in hot alc.; also in ether, acetone, C6H6, or CHCl3; fairly sol. pet ether.

[For prepn. of C from 4-amino-3,5-dichlorobenzaldehyde (1) by diazotization and use of Cu₂Cl₂ reaction (yield of crude C 80%) see (1).]

Č on oxidn. with alk. KMnO₄ gives (1) 3,4,5-trichlorobenzoic acid (3:4920), m.p. 210°.

C on mononitration, with abs. HNO3 in cold, gives (86% yield crude (1)) 2-nitro-3,4,5trichlorobenzaldehyde, m.p. 118.5–119° (corresp. phenylhydrazone, m.p. 229° dec.; corresp. p-nitrophenylhydrazone, m.p. 293-294° dec.; corresp. semicarbazone, m.p. 278-279° dec.).

- 3,4,5-Trichlorobenzaldoxime: unreported.
- ② 3.4.5-Trichlorobenzaldehyde phenylhydrazone: m.p. 147° (1).
- 3,4,5-Trichlorobenzaldehyde p-nitrophenylhydrazone; orange ndls. from nitrobenzene, m.p. 342° dec. (1).
- 3.4.5-Trichlorobenzaldehyde semicarbazone: cryst. from alc., m.p. 252-254° (rap. htg.), but after fusion resolidifies and remelts at 284-285° (1).
- 3:2440 (1) Van de Bunt, Rec. trav. chim. 48, 131-137 (1929).

M.P. 90° (1) [95° (2)]

Cryst. from lt. pet. — Volatile with steam.

[For prepn. of C from 5,6-dichloro-2,3-dimethylaniline (4,5-dichloro-o-3-xylidine) (3) via diazotization and hydrolysis (yield not stated) see (1); for formn. of C from 4,5,6-trichloro-1,1-dimethylcyclohexen-4-one-3 with quinoline at 170° for 30 min. (yield not stated) see (2).1

C with Cl₂ in CHCl₃ does not give the expected 4,5,6-trichloro-2,3-dimethylphenol (3:4742) but instead (2) a tetrachloro deriv. (apparently containing a chlorinated methyl group), m.p. 127.5° (2).

The nitration of C has not been reported, and the expected 4-nitro-5,6-dichloro-2,3dimethylphenol is unknown.

- 5,6-Dichloro-2,3-dimethylphenyl acetate: unreported.
- 6 5.6-Dichloro-2.3-dimethylphenyl benzoate: m.p. 133° (1), 128° (2).

3:2442 (1) Hinkel, Ayling, Bevan, J. Chem. Soc. 1928, 2533. (2) Hinkel, J. Chem. Soc. 125, 1850-1851 (1924). (3) Hinkel, Ayling, Bevan, J. Chem. Soc. 1928, 1876-1877.

M.P. 91° (1) 90° (2)

Ndls. from alc.

[For prepn. of C from 2,3,4-trichlorobenzal (di)chloride (3:2212) in 58% yield by hydrolysis with fumg. H₂SO₄ as directed see (2).]

C on oxidn. with KMnO4 gives (1) 2,3,4-trichlorobenzoic acid (3:4810), m.p. 186-187°.

 \bar{C} with anhydr. NaOAc + Ac₂O on htg. (Perkin synthesis) gives (2) 2,3,4-trichloro-cinnamic acid [Beil. IX-597], m.p. 185°.

- 2,3,4-Trichlorobenzaldoxime: unreported.
- ---- 2,3,4-Trichlorobenzaldehyde phenylhydrazone: unreported.
- ---- 2,3,4-Trichlorobenzaldehyde p-nitrophenylhydrazone: unreported.

Deliquescent tbls, eas. sol. alc., ether; cryst from CHCl₃ (1); spar. sol. pet. ether. [For prepn. from α,α' -dichloroacetone (3:0563) + HCN, followed by hydrolysis of the resultant nitrile with HCl (overall yield alm. quant. (4)), see (3) (4)]

3:2565 (1) Smith, Z. physik Chem. A-177, 137-138 (1936). (2) Favrel, Bull. soc. chim. (5) 1, 985 (1934). (3) Grimaux, Adam, Bull. soc. chim. (2) 36, 20 (1881), Ann. chim (5) 23, 361-362 (1881). (4) Glattfeld, Schneider, J. Am. Chem. Soc. 60, 417 (1938).

3:2570 d,l-1,2-DICHLORO-1,2-DIPHENYLETHANE (d,l- α,α_l -Dichlorobibenzyl; " β " stilbene dichloride)

$$\begin{array}{c|c} & C_{14}H_{12}Cl_2 & \text{Beil. V - 601} \\ & V_{1}\text{-(282)} \\ & V_{2}\text{--} \\ \\ Cl\text{--}C\text{--}H & \\ & \\ \end{array}$$

[See also the isomeric meso or " α " stilbene dichloride (3:4854).]

Colorless tbls. or lfts. — Eas. sol. most org solvents but least in lgr. — Readily separable from the much less soluble isomeric " α " stilbene dichloride (3:4854) by recrystn. from alc. — Sublimes without decompn.

[For preparation of \bar{C} see text of the isomeric " α " stilbene dichloride (3:4854) cf. also (8), noting that many (but not all) of its methods of prepn. give more or less \bar{C} .— Note also that by reaction of the optically active forms of α -amino- α' -hydroxybibenzyl in HCl with NOCl both of the corresp. optical antipodes of \bar{C} have been prepd. (5).]

 \bar{C} on htg. above its m.p. is partially isomerized to the isomeric " α " stilbene dichloride (3:4854) so that m.p. gradually rises to about 160° (1).

[C with AgOAc (2 moles + 25% excess) in AcOH at 100° for 9 hrs. gives (8) mixts. of hydrobenzoin diacetate, m.p. 133-134°, and isohydrobenzoin diacetate, m.p. 114-116° (for m.p./compn. diagram of this pair see (8) (9))

 \bar{C} with pyridine in s.t. at 200° for 8 hrs. loses 1 HCl giving (2) one of the two stereoisomeric α -chlorostilbene's, viz., the solid stereoisomer [Beil V-633, V₁-(304)], m.p. 52-54° (2); note that the isomeric " α " stilbene dichloride (3:4854) is inert to pyridine and does *not* show this behavior.

3:2615 6-CHLORONAPHTHOL-1

$$\begin{array}{cccc} OH & C_{10}H_7OCl & \textbf{Beil.\,VI-612} \\ & & & & & & & & & \\ CI & & & & & & & & \\ & & & & & & & & \\ & & & & & & & & \\ & & & & & & & \\ & & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & \\ & & & \\ & \\ & & \\ & \\ & & \\ & \\ & & \\ & \\ & \\ & & \\ &$$

M.P. 94° (1)

Long white pr. from CS2; C rapidly turns gray-violet in air.

[For prepn. of \tilde{C} from γ -(3-chlorophenyl)paraconic acid [Beil. XVIII-421] on distillation see (1).]

C dis. in aq. alk. and this soln. couples (1) with diazonium salts.

Č with aq. FeCl₃ gives a yellowish-white ppt. unchanged on stdg.; Č with Ca(OCl)₂ solns. gives (1) a pale violet ppt.

Č (1 mole) with PkOH (1 mole) in CHCl₃ yields an addn. cpd., Č.PkOH, yel.-red ndls., m.p. 165° (1).

6-Chloro-1-naphthyl acetate: tbls. from alc. + ether, m.p. 47° (1). [From C on boilg. with excess Ac₂O (1).]

3:2615 (1) Erdmann, Kirchhoff, Ann. 247, 376-378 (1888).

[See also β -chloroisocrotonic acid (3:1300).]

Cryst. from lgr. or CS₂. — \bar{C} is sol. in 35.2 pts. aq. at 19° (2), in 44.4 pts. aq. at 12° (3).— \bar{C} is only slightly volatile with steam (2) (dif. from isomeric β -chloroisocrotonic acid (3:1300)).— \bar{C} in either cis- α,β -dichloroethylene (3:5042) or $trans-\alpha,\beta$ -dichloroethylene (3:5028) at 0° is very much less soluble than the isomeric β -chloroisocrotonic acid (3:1300) (11). — \bar{C} can be sublimed at 120° (1).

For f.p./compn. data and diagram of system $\ddot{\mathbf{C}}$ + the isomeric β -chloroisocrotonic acid (3:1300) (eutectic, m.p. 38.9°) contg. 33.2 mole % $\ddot{\mathbf{C}}$) see (12).

Preparation. [The most frequently used method of preparation of \tilde{C} is that from ethyl acetoacetate (1:1710) with PCl₅; this treatment leads to the formation of a mixt. of the acid chlorides of \tilde{C} and of the isomeric β -chloroisocrotonic acid (3:1300) which upon hydrolysis with aq. gives a mixt. of the two acids; from this mixture the β -chloroisocrotonic acid is removed (together with any unreacted ethyl acetoacetate) by distillation with steam; the residual \tilde{C} is then further purified by recrystallization. — The yield of the mixt. of \tilde{C} with its stereoisomer is variously reported, e.g., 43.7% (4), 36.5% (10); the yield of pure \tilde{C} is relatively small; e.g., 16.9% (4), 11% (13). — The PCl₅ reactn. has often been carried out in dry C_6H_6 (14) (15) (10) (4), but its use is regarded (1) as disadvantageous. — For many important details of procedure see indic. refs.]

[For formn. of \bar{C} from α, β, β -trichloro-n-butyric acid (3:0925) by removal of the α and one β chlorine atoms with Zn see (16); from tetrolic acid, CH₃—C \equiv C.COOH [Beil. II-479, II₁-(208), II₂-(451)] by addn. of 1 HCl from conc. aq. HCl on stdg. some weeks in s.t. at room temp. see (17); from the stereoisomeric β -chloroisocrotonic acid (3:1300) with conc. aq. HCl in s.t. at 100° for 6 hrs. see (18).]

Chemical behavior. \vec{C} on htg. at 150–160° for 20 hrs. (17) or at 130° in s.t. (22) is largely isomerized to β -chloroisocrotonic acid (3:1300).

[\bar{C} in alc. (5) or aq. (5) (19) NaOH with $H_2 + Pd/BaSO_4$ or \bar{C} with Na/Hg (20) (2) yields crotonic acid (1:0425), m.p. 72°; note that \bar{C} is thus dehalogenated more slowly (5) than the isomeric β -chloroisocrotonic acid (3:1300), and that with excess H_2 the crotonic acid is further reduced to n-butyric acid (1:1035).]

C on oxidn. with aq. KMnO₄ yields (21) only AcOH (1:1010) and oxalic acid (1:0445).

 $\bar{\mathbb{C}}$ with $\mathrm{Cl_2}$ in $\mathrm{CS_2}$ soln. adds 1 mole halogen yielding (16) α,β,β -trichloro-n-butyric acid (3:0925), m.p. 52°; $\bar{\mathbb{C}}$ undoubtedly also adds 1 Br₂ to yield β -chloro- α,β -dibromo-n-butyric acid, but the latter has never been reported.

 \tilde{C} behaves as a monobasic acid, dissociation const. at $25^{\circ} = 1.44 \times 10^{-4}$ (23). — \tilde{C} on neutralization with cold dilute alk. gives Neut. Eq. = 120.5, forms stable salts. — Note, however, that \tilde{C} with 6.7% aq. KOH at 70-80° (24) cf. (25) (26) splits off HCl yielding tetrolic acid, CH₃.C=C—COOH; \tilde{C} with excess conc. aq. KOH (e.g., abt. 7 N) begins to decompose even below 100° yielding (24) acetone (1:5400) + K_2CO_3 + KCl.

Salts. [NH₄ \bar{A} , (27); Na \bar{A} . $\frac{1}{2}$ H₂O, very sol. aq., and does not isomerize on htg. (2); Ag \bar{A} on htg. with aq. in s.t. at 170° dec. yielding CO₂ + propadiene (allylene) but does so more slowly than the silver salt of the isomeric β -chloroisocrotonic acid (3:1300) (18); Ba \bar{A}_2 , very sol. aq. (2); Cu \bar{A}_2 .H₂O (2).]

 $[\bar{C}]$ with PCl₅ yields (28) (29) β -chlorocrotonoyl chloride; note, however, that, although this product is presumably involved in the prepn. of \bar{C} from ethyl acetoacetate with PCl₅ (see above under preparation of \bar{C}) cf. (29), yet it has never been isolated in pure form nor its properties specifically characterized (the m.p. 94° reported in various places is an error, the value referring in fact (28) to \bar{C}); this lack of data is presumably due to its easy isomerization to the stereoisomeric β -chloroisocrotonoyl chloride, b.p. 135–136° at 760 mm. (30).]

[\bar{C} (as K salt) with alc. NaOEt on htg. gives after acidification (24) β -ethoxycrotonic acid [Beil. III-371, III₁-(135)], m.p. 137-138° (24), 141° (31). — \bar{C} (as Na salt) with Na benzylate on htg. gives after acidification (32) β -benzyloxycrotonic acid, m.p. 121-122° (32). — \bar{C} (as Na salt) with Na salt of benzyl mercaptan in the cold gives after acidification (32) a β -benzylmercaptocrotonic acid, m.p. 192-194°; at 100°, however, there is also obtained (32) a stereoisomer, m.p. 130°.]

[For behavior of \bar{C} (as NH₄ salt) with (NH₄)₂SO₃ yielding β -sulfocrotonic acid (33) or of \bar{C} (as K salt) with K₃AsO₃ yielding β -arsonocrotonic acid (9) see indic. refs.]

- [\bar{C} with C_6H_6 + AlCl₃ not only undergoes Friedel-Crafts reactn. but also addition of C_6H_6 to unsatd. linkage giving (35–38% yield (34)) β,β -diphenyl-n-butyric acid, m.p. 102–103° (35).]
 - Methyl β-chlorocrotonate: b.p. 64-67° at 14 mm. (see 3:9244). [For study of rate of esterification of C with MeOH see (36) (37).]
 - Ethyl β -chlorocrotonate: b.p. 179–180° (see 3:8538).
 - \bigcirc β -Chlorocrotonamide: ndls. from ether, pr. from aq., m.p. 99-101° (28). [From β -chlorocrotonoyl chloride (see above) with conc. aq. NH₄OH (28).]
 - β-Chlorocrotonanilide: pr. from alc., m.p. 123-124° (28). [From β-chlorocrotonoyl chloride (see above) with aniline + excess cold dil. aq. NaOH (28).]
 - ⑤ β-Chlorocroton-α-naphthalide: pr. from alc., m.p. 169-170° (28). [From β-chlorocrotonoyl chloride (see above) with α-naphthylamine + excess cold dil. aq. NaOH (100% yield (28)).]

3:2638 2,6-DICHLORO-3,5-DIMETHYL-PHENOL

(2,6-Dichloro-m-5-xylenol)

Beil. S.N. 529

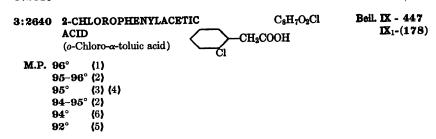

M.P. 95-96° (1) (See also text.)

Cryst. from pet. ether. — Eas. sol. CHCl3, CCl4.

[For prepn. of \bar{C} from 3,5-dimethylphenol (m-5-xylenol) (1:1455) with SO₂Cl₂ (2 moles) in CHCl₃ see (1); note, however, that structure there assigned is 2,4-dichloro-3,5-dimethylphenol (3:2182) q.v.]

The nitration of C has not been reported, and the expected 4-nitro-2,6-dichloro-3,5-dimethylphenol is unknown.

- ---- 2,6-Dichloro-3,5-dimethylphenyl acetate: unreported.
- ---- 2,6-Dichloro-3,5-dimethylphenyl benzoate: unreported.
- 3:2638 (1) Lesser, Gad, Ber. 56, 975 (1923).

284

Colorless ndls. from aq. [For study of ioniz, const. of \bar{C} see (1) (6) (9) (10) (13); for fate in animal body see (3); for studies of bacteriostatic props. see (11) (12).]

[For prepn. of \tilde{C} from o-chlorobenzyl chloride (3:6400) via conversion to o-Cl.C₆H₄.-CH₂MgCl and subsequent carbonation with CO₂ see (2); from o-chlorophenylacetamide (see below) with nitrous acid see (3) (4) (6); from 2-phenyl-4-(2-chlorobenzal)oxazolone-5 (the azlactone from o-chlorobenzaldehyde + N-benzoylglycine + Ac₂O (5)) [Beil. XXVII₁-(298)] on boilg. with aq. NaOH and afterward treated with H₂O₂ see (5).]

[For reactns. of closely related o-Cl.C₆H₄ CH₂.COOMgCl with large excess of isopropyl MgCl or C₆H₅MgBr yielding o-chlorophenylmalonic acid, cryst. from alc., m.p. 139° (7), see (7) (8).]

[For condens. of \ddot{C} with pyrene-3-aldehyde (14) or with N-ethylcarbazole-3-aldehyde (15) in prepn. of intermediates for dyes or pharmaceuticals see indic. refs.]

[Č with PCl₅ yields (3) 2-chlorophenylacetyl chloride, b.p. 119-121° at 12 mm., 118-120° at 10 mm.; this prod. with aminoacetic acid (glycine) in dil. aq. alk. gives (35% yield (3)) o-chlorophenylacetaminoacetic acid (o-chlorophenylaceturic acid), cryst. from hot aq., m.p. 134-135° (3).]

[C converted to Pb salt, latter dried at 110° and distilled, yields (16) 2,2'-dichlorodibenzyl ketone, ndls. from alc., m.p. 102° (16) (oxime, m.p. 112° (16), semicarbazone, m.p. 149° (16)).] [For soly. of many other salts see (4).]

- Methyl 2-chlorophenylacetate: oil, b.p. 125-128° at 23 mm. (4). [From C in MeOH with HCl gas (4); also from o-Cl.C₆H₄.CH₂.MgCl with methyl chloroformate in ether (2); alkaline hydrolysis gives (2) C.]
- Ethyl 2-chlorophenylacetate: oil, b.p. 134° at 23 mm. (4). [From C in EtOH with HCl gas (4).]
- ② 2-Chlorophenylacetamide: lfts. from aq., m.p. 175° (4), 172-175° (3). [From 2-chlorophenylacetonitrile (o-chlorobenzyl cyanide) by partial hydrol. with H₂SO₄ (4) (3); actn. of HNO₂ yields C (see above).]
- ② (2-Chlorophenylacet)anilide: white ndls. from alc., m.p. 138.5° (4). [From C + 1 mole aniline on htg. at 180-190° for ½ hr. (4).]
- ② (2-Chlorophenylacet)-m-chloroanilide: white ndls. from dil. alc., m.p. 154° cor. (17). [From $\ddot{\mathbf{C}} + m$ -chloraniline (1 mole) on htg. at 180–190° for 2 hrs. (17); also from o-chlorobenzyl m-chlorophenyl ketoxime by Beckmann rearr. with PCl₅ in ether (17).]
- ① (2-Chlorophenylacet)-p-toluidide: white ndls. from dil. alc., m.p. 169.5° (4). [From Č on htg. with 1 mole p-toluidine as for the anilide (above) (4).]
- (2-Chlorophenylacet)phenylhydrazide: white lfts. from C₆H₆, m.p. 175° (4). [From C on htg. with 1 mole phenylhydrazine (as above) (4).]

M.P. 96-97° (1)

Ndls. from dil. alc.; insol. aq., sol. hot alc.

[\bar{C} is readily obtd. by spontaneous polymerization of β -chloro-n-butyraldehyde (3:9110).] \bar{C} on htg. with conc. H₂SO₄ not only depolymerizes but also loses HCl yielding (1) crotonaldehyde (1.0150).

 \bar{C} on oxidn. with CrO₃ yields (1) acetic acid (1:1010); with conc. HNO₃ yields β -chloro-n-butyric acid (3:0035).

 \bar{C} on boiling with an aq. suspension of Ag₂O yields (1) silver salt of β -hydroxy-n-butyric acid.

3:2650 (1) Kekulé, Ann. 162, 100-102 (1872).

3:2662 1,1,1-TRICHLORO-2-METHYL-
$$CH_3$$
 $C_4H_7OCl_3$ Beil. I - 382 PROPANOL-2 CH_3 — C — CCl_3 I_{1-} (192) I_{2-} (415) alcohol; acetone chloroform; CH_3 — C — CCl_3 CH_4 — C — CCl_3 CH_5 — C — CCl_3 C — CCl_3 C — CCl_3 C — CCl_3 C — C — CCl_3 C — C — CCl_3

Colorless cryst. with camphoraceous odor; like camphor the cryst. rotate vigorously when placed on clean aq.

 \bar{C} is spar. sol. cold aq. (1 g. \bar{C} dis. in 200 ml. aq. at 15.5°, in 125 ml. aq. at 25° (6), cf. (7) (9)). — \bar{C} is easily sol. hot aq., eas. sol. alc., ether, acetone, AcOH, or CHCl₃.

 \bar{C} is very easily volatile with steam (use in detection of small amts. \bar{C} in aq. soln. (8) (19)). — From hot aq. \bar{C} seps. in ndls. contg. water of hydration: this prod., m.p. 80-82° (5), 80° (6), 80-81° (9) (18) (2), 77° (11), 77.8° (6), 78.8° (6), is often regarded as (5) (18) a hemihydrate; note, however, that its aq. content may vary and the prod. may comprise a solid soln. of aq. in \bar{C} (for extensive study see (1)); in any case distillation of the hydrate

removes the aq. and yields (5) anhydrous $\bar{\mathbb{C}}$ (for conv. of the "hemihydrate" to anhydrous $\bar{\mathbb{C}}$ by use of CaO, CaCl₂, MgCl₂ see (12)); note, however, that anhydrous $\bar{\mathbb{C}}$ on stdg. in air is converted to the "hemihydrate" in less than 30 min. (11). — $\bar{\mathbb{C}}$ readily sublimes even at room temp. and by repeated sublimation yields (18) anhydrous form.

Č has hypnotic, sedative, local anesthetic, and antiseptic characteristics and finds extensive use in medicine and in preservation of biological solns.; it has been used in treatment of nausea and seasickness, e.g., German "Nautissan" or (together with caffeine) as the British "Motherhill's Seasick Remedy" (10).

Č is also employed as a modifier for cellulose acetate (13) (14) (15) (16) or cellulose ethers (17).

[For detn. of C by complete hydrolysis with hot MeOH/KOH and subsequent detn. of chlorine by either volumetric or gravimetric methods see (3) (19).]

[For prepn. of \bar{C} from a setone (1:5400) + CHCl₃ (3:5050) by addn. of dry powdered KOH (0.5 mole) below 0° (5) or 2-3° (4) or KOH in alc. as directed (11) (yields: 25% (11), 23% (5)) (2) (4) see indic. refs.; note that use of NaOH lowers the yield (5) and that Ca(OH)₂ (11), Zn(OH)₂ (5), or Al(OH)₃ (5) yields no \bar{C} ; note also that the crude prod. contains some diacetone alcohol (1:6423) which is best removed by treatment with aq. (11) since otherwise it appears to form with \bar{C} a const.-boilg. mixt.

[For prepn. of C from trichloroacetyl chloride (3:5420) with MeMgI in ether (4) or from ethyl trichloroacetate (3:5950) with MeMgBr in ether (20) see indic. refs]

[\bar{C} with granulated Zn + conc. HCl (in pres. of a little ether) is reduced (21) to terbutyl alc. (1:6140), m.p. 25°, but \bar{C} in 70% alc. warmed with Zn dust for 5 hrs. gives (4% yield (22)) 1,1-dichloro-2-methylpropene-1 (3:5300) + 1-chloro-2-methylpropene-1 (3:7120) + isobutylene (23). — \bar{C} with granulated Zn in boilg. AcOH yields (21) terbutyl acetate (1:3057).]

[\bar{C} with Na/Hg in moist ether (21), or with aq. in s.t. at 180° for 3 hrs. (24), or \bar{C} with aq. alc. KOH (25) undergoes hydrol. of its —CCl₃ group yielding α -hydroxy-isobutyric acid (1:0431), m.p. 79°.]

Anhydrous \ddot{C} in dry ether poured onto a lower layer of colorless fuchsin-aldehyde reagt. (Schiff's soln.) gives a purple color (26), but this behavior is not shown by the "hemi-hydrate." — \ddot{C} also reduces NH₄OH/AgNO₃ soln. slowly in the cold (2).

[C with cold 10% aq. KOH is claimed (27) cf. (29) to yield traces of α -chloroisobutyric acid (3:0235) or carbon monoxide + acetone (28), while \bar{C} with solid KOH gives (27) methacrylic acid [Beil. II-421, II₂-(398)], and \bar{C} in MeOH with alk. or tertiary org. bases, or mineral acids, yields (29) methyl methacrylate [Beil. II₂-(398)]

 \ddot{C} with conc. H_2SO_4 (10 wt. pts.) evolves $CO + CO_2 + HCl$ (25) (26); the CO presumably results from the usual action of H_2SO_4 on some α -hydroxy-isobutyric acid (1:0431) first formed by hydrolysis; for the other reactions see (25).

[\bar{C} with PCl₅ at 100° is claimed (30) (31) (21) to yield both bis- $(\beta,\beta,\beta$ -trichloro-ter-butyl) ether [Beil. I-383, I₁-(193)], b.p. 156° (30), and 1,1,1,2-tetrachloro-2-methylpropane (3:4725), m.p. and b.p. both at 167° (30), but later workers (26) could obtain no reaction at all between \bar{C} and PCl₅. — \bar{C} with PBr₅ at 60° (not above because of dissociation of PBr₅) gives (32) cf. (21) 2,3-dibromo-1,1,1-trichloro-2-methylpropane, b.p. 243° (32).]

 $\bar{\rm C}$ with P₂O₅ in dimethylaniline (1) or quinoline (50) htd. at 200° under ord. press. gives (yield: 30-43% (50), 15% (33)) 1,1,1-trichloro-2-methylpropene-2 (3:5605), b.p. 132°, + 57% yield of its synionic isomer 1,1,3-trichloro-2-methylpropene-1 (3:5025), b.p. 45-46°, accompanied by some α -chloroisobutyric acid (3:0235) cf. (50).

[Various reactions of \bar{C} have been employed in prepn. of pharmaceutical prods.: \bar{C} with adipic anhydride (see text of 1:0775) at 160-180° for 8 hrs. (35), or \bar{C} with adipic acid (1:0775) + SOCl₂ grad. htd. to 150-160° (36), gives β,β,β -trichloro-ter-butyl hydrogen

adipate, cryst. from pet. ether, m.p. 70° (35). — \bar{C} with 5-ethyl-5-phenyl-barbituric acid ("Luminal") does not (37) show evidence of molecular cpd. forms. but forms a eutectic, m.p. 70.4°, contg. 90% \bar{C} . — \bar{C} with 2,3-dimethyl-1-phenylpyrazolone-5 ("Antipyrine") does not (38) form a molecular cpd. but gives a eutectic contg. 60 mole % \bar{C} . — \bar{C} with 2,3-dimethyl-4-dimethylamino-1-phenylpyrazolone-5 ("Pyramidone") gives (39) a molecular cpd., m.p. 61-63°. — \bar{C} with chloral (3:5210) or chloral hydrate (3:1270) gives (40) a molecular cpd., m.p. 65°. — See also above (paragraph 4) and below (under $\bar{\mathbb{Q}}$'s).]

[For reactn. of \bar{C} + AlCl₃ (in Friedel-Crafts sense) with benzene, toluene, and *p*-xylene see (31); for reactn. of \bar{C} with ethyl sodio-acetoacetate see (25).]

[\bar{C} with aniline in alc. KOH gives according to conditions (41) either β (or α)-anilinoiso-butyranilide [Beil. XII-558], cryst. from alc., m.p. 155-157° (41), or β -anilinoisobutyric acid [Beil. XII-497], cryst. from alc., m.p. 185° (41). — For study of reactions of \bar{C} with p-ethoxyaniline (p-phenetidine) + alc. KOH see (42); of \bar{C} with o-phenylenediamine + alc. KOH see (41).]

- Carbylamine test:
 Ö with aniline + aq. alk. on warming gives characteristic odor of phenyl isocyanide (phenyl carbylamine).
- Dodoform reaction: C
 in aq soln. (1/200) treated with aq. NaOH + I₂/KI soln. gives
 yel. ppt. of iodoform (m.p. 119°) with its characteristic odor.
- —— β₁β₂β-Trichloro-ter-butyl acetate: oil, b.p. 191° (21), 190–191° (4), 151–152° at 237 mm. (43). [From C̄ (1 pt.) with Ac₂O (2 pts.) + anhyd. NaOAc (1 pt.) refluxed 2 hrs. (85% yield (43)), or from C̄ (1 mole) with AcCl (1 mole) under reflux (37% yield (21)).] [Note that this ester, although unaffected by 10% aq. NaOH at 100° for 20 min. (dif. from C̄ which is hydrolyzed), is rapidly saponified by boilg. with 3–4 vols. conc. HNO₃ for a few minutes, and upon dilution with aq ppts. C̄ (43).]
- ⑤ β,β,β-Trichloro-ter-butyl benzoate: cryst. from alc. upon addn. of aq, m.p. 34-35° (44) (45). [From C̄ with BzCl at 100° until evoln. of HCl stops (6 hrs.) (44) (45), or from C̄ + benzoic acid (1:0715) in pres. of ZnCl₂ (45).] [Note that this ester on boilg, with conc. HNO₃ is not hydrolyzed (dif. from esters of C̄ with aliphatic acids, e.g., acetate (above)), but nitrated (46) yielding mainly β,β,β-trichloro-ter-butyl m-nitrobenzoate (see below).]
- β,β,β-Trichloro-ter-butyl o-nitrobenzoate: pl. from alc., m.p. 91° (46) (47). [From C with o-nitrobenzoyl chloride on warming (46) (47).]
- $\bigoplus \beta_{,\beta,\beta}$ -Trichloro-ter-butyl p-nitrobenzoate: ndls. from alc., m.p. 145° (46) (47). [From \bar{C} with p-nitrobenzoyl chloride on warming (46) (47).]
- \bigcirc β,β,β -Trichloro-ter-butyl 3,5-dinitrobenzoate: unreported.
- β,β,β-Trichloro-ter-butyl carbamate: pl. from C₆H₆, m.p. 102° (48) (49). [From C with Na in C₆H₆ at room temp. for 4 hrs., followed by conversion of the presumably resultant metal alcoholate with phosgene (3:5000) in toluene to β,β,β-trichloro-ter-butyl chloroformate (not isolated), and reaction of the latter in the C₆H₆/toluene soln. with dry NH₃ gas (55% yield (48)) (49); note that earlier attempts (26) to obtain a metal alcoholate in toluene had led to serious explosions (cf. alkali metals with CHCl₃) (3:5050).]
- $\beta_1\beta_1\beta_2$ -Trichloro-ter-butyl N-phenylcarbamate: ndls. from C_6H_6 , m.p. 118° (48). [From \bar{C} as in the preceding case except that aniline was used in place of NH₃ in last step; yield is poor (48).]
- β,β,β -Trichloro-ter-butyl N-(α -naphthyl)carbamate: unreported.

3:2690 2-CHLORORESORCINOL OH
$$C_6H_5O_2Cl$$
 Beil. S.N. 554 OH

[See also 4-chlororesorcinol (3:3100) and 5-chlororesorcinol (3:3530).]

Colorless cryst. purified by sublimation.

[For prepn. of $\bar{\mathbb{C}}$ from 2,4-dihydroxy-5-nitrobenzoic acid (5-nitro- β -resorcylic acid) [Beil. X-382, X₁-(179)] via chlorination with SO₂Cl₂ in AcOH to 3-chloro-2,4-hydroxy-5-nitrobenzoic acid, reduction of the latter with SnCl₂/HCl in AcOH to 3-chloro-2,4-dihydroxy-5-aminobenzoic acid, with final removal of the amino group by diazotization and use of alk. SnCl₂, see (1)

[\bar{C} is formed in small amt. together with 4-chlororesorcinol (3:3100) from resorcinol (1:1530) by actn. of N,N-dichlorourea (2).]

[Note that attempts (3) cf. (1) to prepare C from 2-aminoresorcinol [Beil. XIII-782] by diazotization and use of Sandmeyer reactn. have failed because the actn. of nitrous acid yields 4-nitroso-2-diazoresorcinol.]

[The prod., m.p. 89°, b.p. 255-256°, obtained (4) from resorcinol (1:1530) with SO₂Cl₂ in ether may have contained \bar{C} .]

3:2705 5-CHLORO-3,4-DIMETHYLPHENOL OH
$$C_8H_9OCl$$
 Beil. VI — VI₁— VI₂—(456)

M.P. 98° (1) (2)

Ndls. from lt. pet. — Volatile with steam.

[For prepn. of Č from 5-chloro-3,4-dimethylaniline (6-chloro-o-4-xylidine) (1) via diazotization and hydrolysis (yield not stated) see (1); from 6-amino-5-chloro-3,4-dimethylphenol (6-chloro-5-amino-o-4-xylenol) (2) via diazotization and elimination of original amino group using Cu₂Cl₂ reaction (unusual) (yield not stated) see (2)]

 \bar{C} with $\bar{C}l_2$ in CHCl₃ gives (1) 2,5,6-truchloro-3,4-dimethylphenol (3:4747), m.p. 182.5°. The nitration of \bar{C} has not been reported, and neither of the two possible mononitro derivs. nor the corresp. dinitro deriv. is known.

Č in alk. soln. couples with benzenediazonium chloride giving (2) the corresp. azo cpd., red ndls. from alc., m.p. 143° (2).

- --- 5-Chloro-3,4-dimethylphenyl acetate: unreported.
- **D** 5-Chloro-3,4-dimethylphenyl benzoate: m.p. 42° (1).

3:2705 (1) Hinkel, J. Chem. Soc. 125, 1853 (1924). (2) Hinkel, Ayling, Bevan, J. Chem. Soc. 1928, 2532.

3:2710 2,3,4,5-TETRACHLOROTOLUENE

Ndls. from MeOH.

[For prepn. of \bar{C} from 3,4,5-trichloro-2-aminotoluene (3) or from 2,4,5-trichloro-3-aminotoluene [Beil. XII-872] (2) (3) via diazotization and use of Cu₂Cl₂ reactn. see indic. refs.; from 3,4,5-trichlorotoluene (3:0580) with Cl₂ in pres. of Al/Hg (2) (3) or with SO₂Cl₂ + AlCl₃ + S (35% yield (1)) see indic. refs.]

[C at b.p. with Cl₂ yields (4) 2,3,4,5-tetrachlorobenzal (di)chloride (3:9397).]

 \bar{C} on nitration with 6 pts. of a mixt. of 2 pts. HNO₃ (D=1.48) + 4 pts. H₂SO₄ (D=1.84) at 105° for ½ hr. (1) yields 2,3,4,5-tetrachloro-6-nitrotoluene, m.p. 159.6° cor. (1), 159° (3).

3:2710 (1) Silberrad, J. Chem. Soc. 127, 2682-2683 (1928). (2) Cohen, Dakin, J. Chem. Soc. 85, 1280, 1285 (1904). (3) Cohen, Dakin, J. Chem. Soc. 89, 1453-1455 (1906). (4) Chem. Fabrik Griesheim-Elektron, Brit. 251,511, May 27, 1926; French 603,650, April 20, 1926; Cent. 1926, II 2355.

[See also 4-chlorophthalic acid (3:4390).]

Cryst. from CCl₄ (5) (4), from Ac₂O (2), from ether, or from alc. (For crystallographic consts. see (2).) — Eas. sol. alc., ether, CHCl₃; less sol. CS₂; spar. sol. lgr.

[For use of \bar{C} with glycerol or ethylene glycol in prepn. of glyptal type resins see (26).] [For prepn. of \bar{C} from 4-chlorophthalic acid (3:4390) by htg. or sublimation (6) (7) (8) (1) (9) or by htg. with AcCl (2) see indic. refs.; from NaH \bar{A} with conc. H₂SO₄ at 100° see (10); from phthalic anhydride (1:0725) with Cl₂ in pres. of Fe or Fe salts at 160-260° see (11) (note that crude \bar{C} obtd. by chlorination methods or from 4-chlorophthalic acid obtd. by chlorination methods may cont. dichlorophthalic anhydrides from which \bar{C} is separable by its greater soly. in toluene (4)); from 4-nitrophthalic anhydride [Beil. XVII-486, XVII₁-(250)] with Cl₂ at 240° see (12)]

[C with Cl₂ in fumg. H₂SO₄ in pres. of I₂ gives (13) mixt contg. much 3,4-dichlorophthalic anhydride (3:3695), m.p. 120-121°, b.p. 329°, and little 4,5-dichlorophthalic anhydride (3:4830), m.p. 187°.]

[\bar{C} with SOCl₂ + ZnCl₂ in s.t. at 240° yields (27) 4-chlorophthalyl (di)chloride [Beil. IX-817], b.p. 275-276° (6)]

[C in MeOH satd. with dry HCl yields (6) dimethyl 4-chlorophthalate, ndls. from lgr., m.p. 38° (5), m.p. 37° (6), b.p. 186–187° at 32 mm. (5); C in EtOH similarly gives (6) diethyl 4-chlorophthalate, b.p. 173–174° at 16 mm. (14), 300–305° (6).

Č fused and treated with dry NH₃ gas (6) or Č htd. with urea (28) yields 4-chlorophthalimide [Beil. XXI-503, XXI₁-(391)], m.p. 210-211° (6) (3). [Ring opening of this prod. with NaOCl yields (9) 3 pts. 4-chloro-2-aminobenzoic acid (4-chloroanthranilic acid) [Beil. XIV-365, XIV₁-(548)], m.p. 235-236° (9), and 1 pt. 5-chloro-2-aminobenzoic acid as "anhydride," m.p. 178-179° (9).] [For use of 4-chlorophthalimide in prepn. of pigments of phthalocyanine type see (28).]

[C fused with aminoacetonitrile hydrochloride or sulfate yields (15) 4-chlorophthalimidoacetamide, ndls. from hot aq., m p. 241° (15); C htd. with methyleneaminoacetonitrile until evoln. of CH₂O ceases yields (15) 4-chlorophthalimidoacetonitrile, ndls. from dil. AcOH, m.p. 146.5° (15); C htd. with glycine yields (15) 4-chlorophthalimidoacetic acid, yel. pl. from hot aq. or dil. alc., m.p. 205° (15).]

[C with 2 moles phenol htd. with ZnCl₂ at 115-130° for 48 hrs. as directed (2) gives 76% yield phenol (di)chlorophthalein, m.p. 214-233°, and prob. a mixt. of isomers; C with resorcinol htd. with trace conc. H₂SO₄ yields (6) a prod. behaving as dichlorofluorescein.

— Note, however, that C with hydroquinone (1:1590) + AlCl₃ + NaCl htd. at 200-220°

(4) or \bar{C} with p-chlorophenol (3:0475) + fumg. $H_2SO_4 + H_3BO_3$ htd. 20 hrs. at 175-195° gives (95% yield (4)) 6-chloro-1,4-dihydroxyanthraquinone (6-chloroquinizarin), tbls. from toluene, m.p. 188° (diacetate, m.p. 213°, dimethyl ether, m.p. 168.5° (4)).]

[C with C6H6 + AlCl3 yields (6) (3) 4-chloro-2-(benzoyl)benzoic acid [Beil. X-750, X₁-(356)], cryst. from xylene, m.p. 180.5° (3), from C₆H₆, m.p. 170° (6) (this on ring closure with conc. H₂SO₄ at 160-170° for 10 min. gives 2-chloroanthraquinone (3:4922), m.p. 204° (3). — \bar{C} with chlorobenzene (3:7903) + AlCl₃ yields (3) (17) 4-chloro-2-(pchlorobenzovl) benzoic acid [Beil. X_1 -(357)], cryst. from xylene, m.p. 195.5° (3) (this on ring closure as above gives (3) 2,6-dichloroanthraquinone [Beil. VII-788, VII₁-(413)], m.p. 278° (3)). — For similar condensations of \tilde{C} + AlCl₃ with p-dichlorobenzene see (3), with bromobenzene see (18), with naphthalene see (25) (19), with toluene see (19) (20), with perylene see (21) (22), with 2,2'-dinaphthyl see (23)]

[For use of C in prepn. of pigments of the phthalocyanine type see (24) (28).]

C on warming with aq. readily hydrolyzes; C on saponification with standard alk. (Sap. Eq. = 91.3) followed by acidification yields 4-chlorophthalic acid (3:4390) q.v.

(10) [See also a-chloroisocrotonic acid (3:1615).]

96°

Ndls. from aq. (4) (20) or pet. eth. (8). — \bar{C} is sol. in 47.1 pts. aq. at 19° (13); 100 pts. satd. aq. soln. at 12.5° cont. 1.97 pts. \bar{C} (9). — \bar{C} is less (9) (5) volatile with steam than the isomeric α -chloroisocrotonic acid (3:1615). — Eas. sol. alc. or ether (10). — Readily sublimes (10). — Note that the m.p. of mixts. of \bar{C} with β -chlorocrotonic acid (3:2625) is depressed far below either (4).

[For thermal anal. of system $\tilde{C}+2,6$ -dimethylpyrone see (12); with conc. H_2SO_4 see (14).]

Preparation. For prepn. of \bar{C} from α,α,β -trichloro-n-butyric acid (3:1280) [itself readily obtd. from α,α,β -trichloro-n-butyraldehyde (butylchloral) (3:5910) by oxidn. with HNO₃] by removal of two halogen atoms with Zn dust + aq (83% yield on initial butylchloral hydrate (3)) (10), or with Zn + HCl (15), see indic. refs.; from the higher-melting form of α,β -dichloro-n-butyric acid ("isocrotonic acid dichloride") (3:1903) by splitting out HCl with alc. KOH see (17) (18); from the lower-melting form of α,β -dichloro-n-butyric acid ("crotonic acid dichloride") (3:1375) by splitting out HCl with excess aq. NaOH (5) (18) or with pyridine at 100° for 3 hrs. (4) or with 1% Am₃N refluxed at 160-180° for 16 hrs. (85% yield (28)) (note, however, that with NaOH the yield is low and much of the isomeric α-chloroisocrotonic acid (3:1615) is formed); from α-chloro-β-hydroxy-n-butyric acid [Beil., III-309, 310] by elimination of H₂O with warm 80% H₂SO₄ see (17).]

[For prepn. of \bar{C} from α,α,β -trichloro-n-butyraldehyde (butylchloral) (3:5910) by simultaneous oxidn. and elimination of HCl with aq. K₄Fe(CN)₆ (yield 44.3% (3)) (19) see indic. refs.]

[For form. of \bar{C} from crotonic acid (1:0425) by actn. of Cl_2 and distillation of product see (20); from α -chloroisocrotonic acid (3:1615) by htg. in s.t. at 150–160° for 12 hrs. (21), with pyridine HCl in pyridine 7 days at room temp. (4), or to small extent even on steam distn. (22) see indic. refs.; from the methyl, ethyl, or n-propyl esters of α -chloro- α -vinylacetic acid or from α -chloro- α -vinylacetonitrile (or amide) on hydrolysis with alkali (note shift of double bond from β , γ to α , β position) see (11); from ethyl α -chlorocrotonate (3:8523) by hydrolysis with conc. HCl see (23).]

Chemical behavior. [C on reduction with Na/Hg is dehalogenated yielding (10) crotonic acid (1:0425), m.p. 72°; note, however, that C does not readily absorb H₂ even in pres. of Pt black (11).]

 \bar{C} with Cl_2 in CS_2 adds 1 mole halogen yielding (24) α, α, β -trichloro-n-butyric acid (3:1280), m.p. 59.5-60°. — \bar{C} adds Br_2 readily (15) yielding (10) α, β -dibromo- α -chloro-n-butyric acid [Beil. II-286], m.p. 92° (10).

 \bar{C} with fumg. HCl in s.t. at 100° for 5 hrs. adds 1 HCl to double bond yielding (17) (18) the higher-melting α,β -dichloro-n-butyric acid (3:1903), m.p. 78°.

 $\bar{\rm C}$ behaves as a monobasic acid; dissociation const. at 25° is 7.2 \times 10⁻⁴ (25); Neut. Eq. 120.5.

[Salts: NH₄ \bar{A} , lfts. or hexag. tbls., sublimable (10); Na \bar{A} (10); K \bar{A} , lfts. from alc. in which it is spar. sol. (1 pt. K \bar{A} in 736.4 pts. 99% alc. at 16.5° (5)) (use in sepn. of \bar{C} from the isomeric α -chloroisocrotonic acid (3:1615) (4) (18) (17); Ag \bar{A} , ndls., spar. sol. aq. (10) (17); Ca \bar{A}_2 , pr. spar. sol. cold aq. (10) (17); Ba \bar{A}_2 , more sol. aq. than Ca \bar{A}_2 (10) (17); Cu \bar{A}_2 , blue ndls., converted by warm aq. to a basic salt (10); Pb \bar{A}_2 -H₂O (10).]

[\bar{C} with NaOEt is unchanged even at 215° (20), but \bar{C} with 10 N KOH at 190–200° decomposes with form. of AcOH (1:1010), oxalic acid (1:0445), CO₂ + H₂ + other prods. (20).]

[For study of rate of reactn. of C with K₃AsO₃ see (2).]

[\tilde{C} with PCl_5 on warming gives (10) α -chlorocrotonoyl chloride, liq. with sharp odor, b.p. 142° (10).]

— Methyl α-chlorocrotonate: b.p. 161-162° (see 3:5870). [For study of rate of esterification of C with MeOH see (26) (27).]

294

- Ethyl α -chlorocrotonate: b.p. 176° (see 3:8523).
- Φ α-Chlorocrotonamide: lfts., spar. sol. cold aq., eas. sol. alc.; m.p. 113.5° (8), 111.5-112.5° (11), 107° (10). [From α-chlorocrotonyl chloride (above) (10) or ethyl α-chlorocrotonate (11) with conc. aq. NH₄OH; also by other routes such as from α,α,β-trichloro-n-butyraldehyde (3:5910) with NH₄OH + KCN (93% yield (8)).]
- ---- α-Chlorocrotonanilide: unreported.
- ---- α -Chlorocroton- α -naphthalide: unreported.

3:2800 5-CHLORO-2-HYDROXY- Cl $C_7H_5O_2Cl$ Beil. VIII_-53 CHO CHO OH

Colorless tbls. from alc.; long flat ndls. from C_6H_6 (1). — Insol. aq.; sol. alc., ether. — Sol. in alk. with yel. color.

[For prepn. of \bar{C} from salicylaldehyde (1:0205) by chlorination with Cl₂ (10) (11) in AcOH (2), or with SO₂Cl₂ (1) (8), see indicated refs.; from 5-chloro-2-hydroxybenzyl alcohol by oxidn. with $K_2Cr_2O_7 + H_2SO_4$ see (6); from 5-chlorosalicylic acid (3:4705) by reduction (poor yield) see (3); from p-chlorophenol (3:0475) via Reimer-Tiemann reactn. (4) or via hexamethylenetetramine (7) see indicated refs.]

C on reduction with Raney Ni (Al/Ni alloy) in 10% aq. alk. at 90° gives (75% yield (16)) o-cresol (1:1400).

Č on oxidn. with CrO₃ gives (in poor yield (1)) 5-chlorosalicylic ac. (3:4705), m.p. 172° (1).

 \tilde{C} yields with satd. aq. NaHSO₃ soln. a cpd. \tilde{C} .NaHSO₃ (12) (use in purification of \tilde{C} (4)). — \tilde{C} with NH₃ gives 5,5',5"-trichloro-hydrosalicylamide, yel. scales from ether, m.p. unrecorded (10). — \tilde{C} in alk. gives on oxidn. with H₂O₂ good yield (13) of 4-chloropyrocatechol (3:2470).

Č in AcOH treated with conc. HNO₃ as directed (14) gives 5-chloro-3(?)-nitrosalicylaldehyde, yel. ndls. from et. pet., m.p. 105-107° (14).

Č htd. with chloroacetic ac. (3:1370) and slightly more than 2 moles KOH in s.t. at 160° yields (15) 4-chlorocoumarone (oil, volatile with steam) and 5-chloro-2-formyl-phenoxyacetic ac. (not volatile with steam from alk. soln.), cryst. from aq., m.p. 169-170° (15).

- © 5-Chlorosalicylaldoxime: ndls. from aq., m.p. 128° (15) (7); 123-124° (9); 122°. (11) (6) [use in inorganic analysis (9)].
- 5-Chlorosalicylaldehyde phenylhydrazone [Beil. XV-189]: m.p. 150-152° (15), 148° (11).
- **5-Chlorosalicylaldehyde** *p*-nitrophenylhydrazone: unreported.
- --- 5-Chlorosalicylaldehyde 2,4-dinitrophenylhydrazone: unreported.
- D 5-Chlorosalicylaldehyde semicarbazone: ndls. from AcOII, m.p. 286-287° (11) (4).

3:2825 p-XYLYLENE DICHLORIDE
$$C_8H_8Cl_2$$
 Beil. V - 384 $(\omega,\omega'\text{-Dichloro-}p\text{-xylene})$ $ClCH_2$ — CH_2Cl V_1 -(186) V_2 -(300) M.P. 100° (1) (2) B.P. 240–245° dec. (2) 98–99° (3) 135° at 16 mm. (1) 98–100° (6)

Lfts. or tbls (from alc.). — Volatile with steam.

[For prepn. from p-xylylene glycol by distn. with conc. HCl see (4); for prepn. from benzyl chloride (3:8535) + trioxymethylene + ZnCl₂ see (1) (42% yield (6)); for prepn. of \bar{C} from p-xylene (1:7415) with SO₂Cl₂ + Br₂O₂ refluxed in sunlight 4 hrs. (58% yield) see (6).]

 \bar{C} on htg. with 30 pts. aq. in s.t. at 170–180° yields (1) (4) p-xylylene glycol [Beil. VI-919], ndls., very sol. aq., alc. or ether, mp 112–113°.

C boiled with Pb(NO₃)₂ soln. yields (5) terephthalaldehyde [Beil. VII-675], fine ndls. from boilg. aq., m.p. 115°.

 \bar{C} htd. with benzyl alc. (1:6480) + KOH gives good yield (1) of p-xylylene glycol dibenzyl ether, cryst. from alc., m.p. 67° (1).

95-96°

[See also 2,3-dichlorohydroquinone (3:4220).]

(4)

Yel. ndls. from aq. (2) or alc. (1). — C has characteristic quinone odor.

[For prepn. of \tilde{C} from 2,3-dichlorohydroquinone (3:4220) by oxidn. with MnO_2+ dil. H_2SO_4 (yields: 88% (1), 60% (3)) (4), or with $CrO_3/AcOH$ (2) see indic. refs.; for formn. of \tilde{C} from p-benzoquinone (1:9025) in HCl or H_3PO_4 with Cl_2 see (6).]

[For study of oxidn.-reductn. potential of system $\bar{C} + 2,3$ -dichlorohydroquinone (3:4220) see (1) (5).]

[C with butadiene-1,3 gives an adduct which upon oxidn. yields (7) 2,3-dichloronaphthoquinone-1,4 (3:4857); similarly C with 2,3-dimethylbutadiene-1,3 gives an adduct which upon oxidn. yields (7) 2,3-dichloro-6,7-dimethylnaphthoquinone-1,4.]

[For use of C as accelerator for vulcanization of rubber see (8).]

[\bar{C} in alc. with p-nitrosodimethylaniline gives (60% yield (9)) corresp. nitrone; for condens. of \bar{C} with other nitroso cpds. and use of prods. as dye intermediates see (10).]

[Č in CHCl₃ with Cl₂ is not attacked at low temps., but at ord. temp. yields (4) tetra-chloro-p-benzoquinone (chloranil) (3:4978).]

 \bar{C} on reductn. (presumably with SO_2+H_2O) yields 2,3-dichlorohydroquinone (3:4220) q.v.

3:2885 3,4,5-TRICHLOROPHENOL OH C₆H₂OCl₃ Beil. VI — VI₁— VI₂-(181)

Ndls. from lgr. — Volatile with steam. — Ionization const. at 25° is 4.5×10^{-9} (4); \bar{C} is too weakly acidic to be titrated (1) although sol. in alk.

[For prepn. from 3,4,5-trichloroaniline via diazo react. (51% yield) see (1) (2); by cleavage of 3,4,5-trichloroanisole see (3).]

Č treated with large excess Br₂ yields 2,6-dibromo-3,4,5-trichlorophenol, ndls. from AcOH, m.p. 180° (3).

The methyl ether of C, 3,4,5-trichloroanisole, prepared indirectly, has m.p. 63° (3).

3,4,5-Trichlorophenyl benzoate: from Č + BzCl + 20% NaOH; ndls. from alc., m.p. 120° (3).

3:2885 (1) Tiessens, Rec. trav. chim. 50, 113 (1931). (2) Herzberg, Scharfenberg, Ger. 367,362, Jan. 20, 1923; Cent. 1923, II 1254. (3) Kohn, Kramer, Monatsh. 49, 163-165 (1928). (4) Tiessens, Rec. trav. chim. 48, 1066-1068 (1929).

3:2910 4,5-DICHLORO-2-METHYLPHENOL (4,5-Dichloro-o-cresol)

OH C₇H₆OCl₂

Beil. VI —
VI₁-(174)
VI₂-(333)

M.P. 101° (1)

Ndls. from pet. ether; spar. sol. pet. ether, eas. sol. alc., AcOH, C6H6.

[For prepn. of C from 4-chloro-2-methylphenol (3:0780) with Cl₂ in CHCl₃ see (1).]

 \tilde{C} in 2 pts. ice-cold HNO₃ (D=1.48) stood for 12 hrs. gives (75% yield (1)) a prod. of compn. $C_7H_6O_8N_3Cl_2$, white ndls. from dry ether by addn. of pet. ether, m.p. 110° dec. (1).

Č in AcOH on mononitration yields (1) 4,5-dichloro-6-nitro-2-methylphenol [Beil. VI₁-(179)], yel. ndls. from pet. ether, m.p. 69° (1).

\$\text{\text{\$\text{\$\delta}\$}}\$ 4,5-Dichloro-2-methylphenyl benzoate: ndls. from \$\text{\$\text{\$C\$}\$}\$ from \$\text{\$\text{\$C\$}\$}\$ in alk. soln. on shaking with benzoyl chloride (1).]

3:2910 (1) Zincke, Ann. 417, 207, 231-233 (1918).

3:2935 2,3-DICHLORONAPHTHOL-1 OH $C_{10}H_6OCl_2$ Beil. VI - 612 $VI_{1} VI_{2}-$

M.P. 101° (1)

Subl. in ndls.; spar. sol. cold aq., mod. sol. hot aq.; eas. sol. alc., ether, AcOH, CHCl3, C_6H_6 .

[For prepn. from sodium 1-naphtholsulfonate-2 by htg. with PCl₅ at 100-120° see (1).]

C dis. in hot Na₂CO₃ yielding sol. Na salt.

Č htd. with PCl₅ at 130-140° yields 1,2,3-trichloronaphthalene (3:2125), colorless ndls. from alc., m.p. 90° (1).

 \bar{C} on oxidn. in s.t. at 200° with dil. HNO₃ (D=1.15) yields (1) phthalic ac. (1:0820), converted in m.p. tube to phthalic anhydride (1:0725), m.p. 128° (1).

Č on oxidn. with CrO₃ in AcOH or dil. H₂SO₄ gives (although in poor yield (1)) 2,3-dichloronaphthoquinone-1,4 (3:4857), gold-yel. ndls. (from alc.), m.p. 190°.

3:2935 (1) Claus, Knyrim, Ber. 18, 2926-2929 (1885).

3:2965 8-CHLORONAPHTHOL-2

Ndls. from lgr.; very eas. sol. alc., ether, AcOH, C₆H₆, CHCl₃; spar. sol. pet. ether. — Volatile with steam. — \bar{C} depresses m.p. of 6-chloronaphthol-2 (3:3500) to 79-88° (5).

[For prepn. of \bar{C} from sodium 2-hydroxynaphthalenesulfonate-8 [Beil. XI-286, XI₁-(67)] with 2 moles PCl₅ at 150–160° see (1) (note that some 1,7-(2,8)dichloronaphthalene (3:1385) is also formed and that its proportion increases with more PCl₅ or at higher temps. (1)); from 8-aminonaphthol-2 [Beil. XIII-685] via diazotization and use of Cu₂Cl₂ reactn. see (2); for formn. of \bar{C} (20% yield (3)) from β -naphthol (1:1540) by treatment with soln. of Na₂CO₃ + Cl₂ see (3) (note that 30% of 2,2'-dhydroxybinaphthyl-1,1' [Beil. VI-1051, VI₁-(519)] together with a tar is also formed (3)).]

- [C (2 pts.) with benzaldehyde (1 pt.) with 7 pts. HBr/AcOH soln. stood for 24 hrs. gives (75% yield (2)) meso-phenyl-dichlorodibenzoxanthane, colorless ndls. from acetone, m.p. 213-214.5° (2).]
- [\bar{C} (as sodium salt) treated with CO_2 under press. at elevated temp. as directed gives (4) 8-chloro-2-hydroxynaphthoic acid-3, pale yel. ndls. from hot C_6H_6 , m.p. 250° (4).]
 - 8-Chloro-2-naphthyl m-nitrobenzoate: citron-yel. ndls. from hot C₆H₆ on addn. of
 4 vols. hot alc., m.p. 176° ⟨5⟩. [From C̄ in warm dil. aq. NaOH on shaking with
 m-nitrobenzoyl chloride ⟨5⟩.]

3:3045 4-CHLORONAPHTHOL-2

C₁₀H₇OCl Beil. S.N. 538

Ndls. from lgr. or 30% aq. alc.

[For prepn. of C from 1,4-dichloronaphthol-2 (3:3840) by partial reduction with SnCl₂ in AcOH/HCl at 100° in s.t. for 8 hrs. (74% yield (2)) (1) see indic. refs.; from 4-chloronaphthol-2-sulfonic acid-1 (2) (see also under 3:3840) by hydrolysis of the sulfonic acid group (91% yield) see (2); from 4-chloronaphthalene-1,2-diazo-oxide (itself obtd. in 95% yield (3) from 4-chloro-2-nitronaphthylamine-1 with HNO₂) on boilg. with Al powder in EtOH for 19 hrs. (84% yield (4)) or (less advantageously) with Na₂SnO₂ (4) see indic. refs.] NaĀ is spar. sol. in cold aq. 10% NaOH (4).

[C with alc. NaOH + CHCl₃ (3:5050) undergoes Reimer-Tiemann reaction giving (but in very small yield (2)) 4-chloro-2-hydroxynaphthaldehyde-1, m.p. 118° (2).]

 \bar{C} (in alk. soln.) with diazotized aniline gives (4) 4-chloro-1-benzeneazonaphthol-2, or -red ndls. from acetone, or crimson ndls. from chlorobenzene, m.p. 165° (4) (note that after fusion and resolidification this prod. has m.p. 151° but after a second resolidification (at about 155°) remelts on slow htg. at 165° (4)). [For use of \bar{C} in prepn. of azo dyes by coupling with o-hydroxydiazonium salts see (5).]

- 4-Chloro-2-naphthyl methyl ether: pl. from lt. petroleum, m.p. $44-45^{\circ}$ (4). [From \bar{C} with Me₂SO₄ + aq. NaOH (4).]
- 4-Chloro-2-naphthyl acetate: pl. from aq. MeOH or lt. petroleum, m.p. 58-59° (2),
 56° (4). [From C with excess Ac₂O refluxed 30 min. (90-100% yield (2)).]
- (2).

3:3070 3,4-DICHLOROBENZOPHENONE (3,4-Dichlorophenyl phenyl ketone) C

C₁₃H₈OCl₂ Beil. S.N. 652

M.P. 104-105° (1) 102-103° (2) (3)

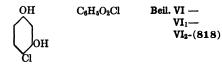

Cryst. (from alc. (1)).

[For prepn. (79.5% yield) from o-dichlorobenzene (3:6055) + BzOH (1:0715) + AlCl₃ see (1); for prepn. from o-dichlorobenzene (3:6055) + BzCl (3:6240) + AlCl₃ see (2) (3).]

3,4-Dichlorobenzophenone oxime: m.p. 153-154° (1). [This oxime upon Beckmann rearr. with H₂SO₄ gives (1) 3,4-dichlorobenzanilide which can be hydrolyzed to 3,4dichlorobenzoic ac. (3:4925), m.p. 207-208° (1), and aniline.]

3:3070 (1) Newton, Groggins, Ind. Eng. Chem. 27, 1398 (1935). (2) Böeseken, Rec. 27, 15 (1908). (3) Kraay, Rec. trav. chim. 49, 1085 (1930).

3:3100 4-CHLORORESORCINOL

302

The nature of the cpd., m.p. 89°, and formerly (3) thought to be C, is still in doubt, cf. (1). \bar{C} is very sol. in aq. and not volatile with steam (1); eas. sol. aq., alc., ether, C_6H_6 , and CS₂ (4).

[For prepn. of C from resorcinol (1:1530) by actn. of SO₂Cl₂ in ether (95% yield (1)) see (1) (4).1

- C with FeCl₃ gives a blue-violet soln. becoming brown on warming (4).
- C reduces NH₄OH/AgNO₃ on warming (4).
- C on further chlorination with SO₂Cl₂ (no details) gives (96% yield (1)) of 4,6-dichlororesorcinol (3:3380).
- \tilde{C} (10 g.) refluxed with KHCO₃ (40 g.) in aq. (50 ml.) for $1\frac{1}{2}$ hrs. gives (76% yield (5)) of 5-chloro-2,4-dihydroxybenzoic acid (6), cryst. from hot aq., m.p. 224-225° cor. (6), 215-216° (Maguenne bloc) after drying at 100-105° (5) (6).

Č in AcOH treated with xanthydrol (1:5205) yields 4-chloro-2-(?)-xanthydrylresorcinol, cryst. from C₆H₆, m.p. 215° (7).

[For studies on prepn. of alkyl ethers of 4-chlororesorcinol for use as antiseptics and germicides see (8); for use of \bar{C} in prepn. of purpurin (1,2,4-trihydroxyanthraquinone) by reaction with phthalic anhydride, H₂SO₄ + H₃BO₃, see (9).]

[For coupling of C with diazotized aniline, p-nitroaniline, or p-toluidine see (11).]

- **4-Chlororesorcinol diacetate:** m.p. 46-47° (10).
- **D** 4-Chlororesorcinol dibenzoate: m.p. 66° (10).

3:3100 (1) Moore, Day, Suter, J. Am. Chem. Soc. 56, 2456-2458 (1934). (2) Likhosherstov, J. Gen. Chem. (U.S.S.R.) 3, 164-171 (1933); Cent. 1934, I 1476; C.A. 28, 1675 (1934). (3) Clark, (3) Clark, 1876, 1676, 1876, 1 Chem. (U.S.S.R.) 14, 203-210 (1944); C.A. 39, 2285 (1945).

(11) Petyunin, J. Gen. Chem. (U.S.S.R.) 14, 303-311 (1944); C.A. 39, 4060 (1945).

3:3130 2-CHLOROHYDROQUINONE OH
$$C_6H_5O_2Cl$$
 Beil. VI - 849 VI₁-(417) VI₂-(844)

[See also 2-chlorobenzoquinone-1,4 (3:1100).]

Colorless lfts. from CHCl₃ in which \tilde{C} is eas. sol. hot but spar. sol. cold. — Very eas. sol. aq., alc., or ether; sol. in warm C_6H_6 (dif from hydroquinone (1:1590) and use in sepn. from latter (1)). — Not sublimable (5).

[For prepn. of \tilde{C} from 2-chlorobenzoquinone-1,4 (3:1100) by reductn. with aq. SO_2 (2) (9) see indic. refs. (note, however, that in dil. aq. NaOH under N_2 both reductn. and sulfonation occur (10)); from benzoquinone-1,4 (1:9025) with conc. HCl (11) (2) or in CHCl₃ with HCl gas (100% yield (12)) (2); from sodium benzoquinonesulfonate (5) with conc. HCl below 20° (55% yield (5)) in CO₂ see indic. refs.; from p-benzoquinone dichloride (2,3-dichlorocyclohexen-5-dione-1,4) [Beil. VII-573] by reductn. with $SnCl_2 + HCl$ at 0° see (4); from hydroquinone (1:1590) in CCl₄ with Cl₂ see (13).]

 $[\bar{C}]$ is used as a photographic developer under name "Adurol" (for identification of \bar{C} in developers see (1)); \bar{C} forms an addn. cpd. (14) with 2 moles p-(methylamino)phenol also used as developer under name Chloranol; for use of \bar{C} as vulcanization accelerator see (15); for use of \bar{C} as antioxidant (16) and as gum inhibitor in cracked gasoline (17) or in aq. emulsion as insecticidal spray (18) see indic. refs.; for study of bactericidal actn. see (19).]

 \bar{C} on oxidn. with NaClO₃ + H₂SO₄ + V₂O₅ in AcOH (92% yield (20)), with K₂Cr₂O₇ + H₂SO₄ (yield: 89% (21), 84% (8)) (2), with MnO₂ + dil. H₂SO₄ (56% yield (8)), or with PbO₂ in C₆H₆ (22) gives 2-chlorobenzoquinone-1,4 (3:1100). [For studies of oxidn-reductn. potential of this system and also for the intermediate quinhydrone see under the quinone (3:1100).]

[For reactn. of \tilde{C} with phthalic anhydride + conc. H_2SO_4 at $130-135^\circ$ see (2); for reactn. of \tilde{C} with naphthalene-1,2-dicarboxylic acid anhydride (23) or with naphthalene-2,3-dicarboxylic acid anhydride (24) each fused with $AlCl_3$ + NaCl see indic. refs.]

 \tilde{C} in AcOH with xanthydrol (1:5205) yields (25) 2-chloro-3-xanthydrylhydroquinone, cryst. from C_6H_6 , m.p. 236-237° (25).

 \bar{C} gives no effervescence with aq. 10% Na₂CO₃ but soln. darkens on stdg. (1); \bar{C} with aq. 5% AgNO₃ scarcely reduces in cold but does so rapidly on warming (1); \bar{C} with 10% aq. FeCl₃ gives red-brown color in cold and on boilg, pronounced quinone-like odor (1).

- ② 2-Chlorohydroquinone diacetate: pr. from dil. alc., m.p. 99° (1) (26), 72° (2), 71-72° (27), 70.5° cor. (3). [From C with Ac₂O (2) or AcCl (26).] [Note that a monoacetate, m.p. 62° (28) has been reported, but the reason for the wide divergence in the m.p.'s reported for the diacetate has not been explained.]
- ② 2-Chlorohydroquinone dibenzoate: fine woolly ndls. from mixt. of alc. + ether, m.p. 130° (2). [From C on refluxing with BzCl (2).]

Colorless ndls. from aq.; eas. sol. aq., alc., ether, C_6H_6 . — Odor faintly like that of phenylacetic acid. — [For study of ioniz. const. of \bar{C} see (6); for fate in animal body see (13).]

[For prepn. of $\bar{\mathbf{C}}$ from p-chlorobenzyl bromide (?) [Beil. V-307] by conversion to p-Cl.C₆H₄.CH₂MgX and subsequent carbonation with CO₂ at 0° (74% yield) see (9); from p-chlorophenylacetonitrile (p-chlorobenzyl cyanide) [Beil. IX-448] by hydrolysis (80% yield (3)) with boilg. aq. KOH (6) (10) or with boilg. dil. H₂SO₄ (8) see indic. refs.; from p-aminophenylacetic acid [Beil. XIV-456, XIV₁-(589)] via diazotization and use of Cu₂Cl₂ reactn. see (5) (2) (11); from 2-phenyl-4-(4-chloro-benzal)oxazolone-5 (the azlactone from p-chlorobenzaldehyde + N-benzoylglycine + Ac₂O) (7) [Beil. XXVII₁-(299)] on boilg. with aq. NaOH and afterwards treated with H₂O₂ see (7); from 3-chloro-1,5-bis-(p-chlorophenyl)pentadiene-1,3 (3) in acetone soln. by oxidn. with KMnO₄ see (3); for formn. from phenylacetic acid (1:0665) with Cl₂ in sunlight see (12); from ethyl p-chlorophenylacetate (see below) by alk. hydrolysis see (19).]

[For reactions of closely related p-Cl.C₆H₄.CH₂.COOMgCl with large excess of isopropyl MgCl or o-tolyl MgBr yielding p-chlorophenylmalonic acid (14), cryst. from alc., m.p. 163° (14), see (14); for quite dif. behavior with other RMgX cpds. see (22).]

[\tilde{C} with benzaldehyde htd. in s.t. for 20 hrs. at 300° not only condenses but also loses CO₂ yielding (6) 4-chlorostilbene (1-(p-chlorophenyl)-2-phenylethylene) [Beil. V-633], white lfts. from AcOH, m.p. 129° (6) (for corresp. reactns. of \tilde{C} with p-methoxybenzaldehyde (1:0240), or with salicylaldehyde (1:0205), see (6)); \tilde{C} (as K salt) with o-nitrobenzaldehyde + Ac₂O htd. 24 hrs. at 100° undergoes Perkin condens. yielding (45–50% yield (15)) α -(4-chlorophenyl)-o-nitrocinnamic acid, colorless cryst. from AcOH, m.p. 186–186.5° u.c. (190.2–190.7° cor.) (15).]

- [C on dinitration with HNO₃ + fumg. H₂SO₄ yields (19) 4-chloro-2,6-dinitrophenylacetic acid, pale yel. ndls. from boilg. aq., m.p. 167° (19).]
- [Č with PCl₅ in CHCl₅ yields (2) (13) p-chlorophenylacetyl chloride, yellowish oil, b.p. 120° at 14 mm. (2); this prod. with aminoacetic acid (glycine) in dil. aq. alk. gives (65-75% yield (13)) (2) p-chlorophenylaminoacetic acid (p-chlorophenylaceturic acid), lfts. from aq., m.p. 165° u.c. (2), 164-165° (13).]
- [Č conv. to Pb salt, latter dried at 110°, and distilled yields (16) 4,4′-dichlorodibenzyl ketone, ndls. from alc., m.p. 93° (oxime, m.p. 135–136°, semicarbazone, m.p. 118° (16)).]—
 [For CaĀ₂.H₂O and AgĀ see (10).]
 - Methyl p-chlorophenylacetate: oil, b.p. 114-115° at 6 mm. (17). [From C in MeOH satd. with dry HCl gas (6).] [For study of rate of reactn. with NH₃ in MeOH at 25° see (17).]
 - Ethyl p-chlorophenylacetate: m.p. 34° (18), 32° (1) (6), b.p. 253-254° at 749 mm. (1), 260° (6). [From \bar{C} in EtOH with dry HCl gas (6).] [This ester melted and treated with sodium evolves H₂ and yields a pale red sodium cpd. (19); the ester with Na sand in dry ether refluxed 8 hrs., then treated with BzCl, gives (poor yield (19)) ethyl α-(4-chlorophenyl)benzoylacetate, ndls., m.p. 97-98° (19); the ester does not (19) condense with itself in pres. of NaOEt but upon treatment with isopropyl MgX gives (93% yield (9)) the desired condens. prod., viz., ethyl α,γ-(p-chlorophenyl)-acetoacetate, white cryst. from alc., m.p. 119-120° (9); for reactn. of ethyl p-chlorophenylacetate with diethyl ethoxymethylenemalonate [Beil. III-469, III₁-(162), III₂-(300)] yielding ethyl 7-chloronaphthol-1-dicarboxylate-2,4 (20) and α-(p-chlorophenyl)glutaconic acid (20) see (20).] [For study of rate of hydrolysis of ethyl p-chlorophenylacetate see (18).]
 - p-Chlorophenylacetamide: tbls. from alc., m.p. 175° (10). [Obtd. indirectly from p-chlorophenylacetonitrile by partial hydrolysis (10).]
 - ① (p-Chlorophenylacet)anilide: lfts. from abs. alc., m.p. 164.5° (19). [From $\bar{C} + 1\frac{1}{2}$ moles aniline at 180–190° for $\frac{1}{2}$ hr. (19).]
 - \bigcirc (4-Chlorophenylacet)-*m*-chloroanilide: colorless ndls. from dil. alc., m.p. 137.5° cor. (21). [From \bar{C} + *m*-chloroaniline (1 mole) on htg. at 180-190° for 1 hr. (21); also from *p*-chlorobenzyl *m*-chlorophenyl ketoxime by Beckmann rearr. with PCl₅ in ether (21).]
 - (4-Chlorophenylacet)-p-toluidide: white ndls. from C_6H_6 , m.p. 189.5° (18). [From $\tilde{C} + p$ -toluidine htd. as for the anilide (above) (19).]
 - (4-Chlorophenylacet)hydrazide: ndls. from alc., m.p. 170° (1). [From ethyl p-chlorophenylacetate (above) with hydrazine hydrate in boilg. alc. (1); for its further condens. prods. with acetone, benzaldehyde, salicylaldehyde see (1); note also that with I₂ in hot alc. the (mono)hydrazine gives (1) N,N'-bis-(p-chlorophenylacetyl)-hydrazine, ndls. from alc., m.p. 255° (1).]
 - (4-Chlorophenylacet)phenylhydrazide: white ndls. from C_0H_0 , m.p. 166° (19). [From \bar{C} with excess phenylhydrazine on htg. as above (19).]

3:3140 2,3,4,5-TETRACHLORO-BENZALDEHYDE

C7H2OCl4 Beil. S.N. 635

M.P. 106-106.5° (1)

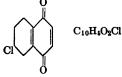

[For prepn. of \bar{C} from 2,3,4,5-tetrachlorobenzal (di)chloride (3:9397) by hydrolysis (presumably with strong H_2SO_4) see (1).]

Č with NaHSO₃ forms the corresp. addn cpd. which may be used as means of sepn. of Č from 2,3,5,6-tetrachlorobenzaldehyde (3:2700).

[For use of C in prepn. of dyestuffs see (1).]

3:3140 (1) Chem. Fabrik Griesheim-Elektron, Brit. 251,511, May 27, 1926; Cent. 1926, II 2355; [C.A. 21, 1361 (1927)]: French 603,650, April 20, 1926, Cent. 1926, II 2355; not in C.A.

3:3145 6-CHLORONAPHTHO-QUINONE-1,4

Beil. S.N. 674

M.P. 106-107° (1)

[For prepn. of \bar{C} from benzoquinone-1,4 (1:9025) by addition of 2-chlorobutadiene-1,3 ("Chloroprene") (3:7080) and subsequent oxidation of the resulting Diels-Alder type adduct see (2); for formn. of \bar{C} by oxidation of various dichloronaphthalenes see (1).

3:3145 (1) Kozlov, Talybov, J. Gen. Chem. **9,** 1827–1836 (1939); C.A. **34,** 4067 (1940). (2) Carothers, Collins (to du Pont Co.), U.S. 1,967,862, July 24, 1934; Cent. **1936**, I 2209; C.A. **28,** 5994–5995 (1934).

3:3155 1,1,2,3,4,4-HEXACHLORO-BUTANE

M.P. 107° (1) (2)

[For isolation of \bar{C} from the high-boilg, fraction resulting in the preparation of trichloroethylene (3:5170) from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) see (1) (2); long refluxing (20 days) of freshly distilled samples of the latter compound also yields (1) \bar{C} .]

C on boilg. with alc. Ca(OH)₂ or with alk. at room temp. loses 2 HCl yielding (1) the liquid stereoisomer (3:6150) of 1,2,3,4-tetrachlorobutadiene-1,3. [The solid stereoisomer (3:0870) was not obtained from C (1).]

3:3155 (1) Müller, Hüther, Ber. 64, 589-600 (1931); C.A. 25, 3956-3957 (1931). (2) Ghighi, Ann. chim. applicata 28, 363-368 (1938); Cent. 1939, I 86; C.A. 33, 6792 (1939).

(" Hexachlorophenol ")

Cryst. from CHCl3 or CS2; white ndls. from pet. eth. (1). — Insol. aq., spar. sol. cold alc., mod. sol. C₆H₆, very eas. sol. CHCl₃ or pet. eth. (4).

[For prepn. by various methods see Beil. VII-144 + Beil. VII₁-(96); for comml. prepn. by chlorination of phenol sec (2).]

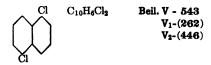

Č with aq. KI (1), or Zn dust in boil. alc. (4), or SnCl₂ + HCl in AcOH (100% yield) (5) (6) or even with conc. aq. or alc. KOH (4), yields pentachlorophenol (3:4850).

C (4 g.) grad. added to conc. HNO₃ (20 g.) with warming, and the resultant soln. poured into aq., ppt. recrystd. from nitrobenzene, yields (5) tetrachlorobenzoquinone (chloranil) (3:4978), m.p. 292° (5).

C melted with conc. H₂SO₄, then htd. cautiously with shaking until reaction suddenly begins, evolves HCl, and on cooling chloranil (see above) separates (5).

M.P. 107° (1) (6) (7) (9) (10) 106.5-107° (2) 106.5° (3) (24)106-107° **(4)** 105-107° (5)

Lfts. from alc. or AcOH. — Sublimes in very broad thin pr. — [For use as wood impregnant see (22).]

[For prepn. of C from 1,5-dinitronaphthalene [Beil. V-558, V₁-(264)] (6) (2), from naphthalene-1,5-bis-(sulfonyl chloride) [Beil. XI-213] (36% yield (4)) (7) (8), from 1-chloronaphthalene-5-sulfonyl chloride [Beil. XI-161] (9) (5), from 5-chloronaphthol-1 [Beil. VI-612| (10) by htg. with PCl₅ see indic. refs.; from 5-sulfonaphthylamine-1 [Beil. XIV-744. XIV₁-(733)] by htg. corresp. diazonium salt with 2 moles PCl₅ see (1) (11); from 1,5dichloro-7-aminonaphthalene by replacement of -NH₂ by -H see (12); from 1,5-dichloronaphthalenesulfonic acid-2 [Beil. XI-181] by hydrolysis of -SO₃H group see (13) (14); from 4,5-dichloronaphthalene-2-sulfonyl chloride [Beil. XI-182] or from 1,8-dichloronaphthalene (3:2435) by htg. with conc. HCl in s.t. at 290° see (15); from naphthalene (1:7200) in CCl₄ at -10 to 0° with Cl₂ in pres. of Fe (together with other products) (16) or from 1nitronaphthalene [Beil. V-553, V_1 -(264)] with Cl_2 (together with other products) (17) (2) see indic. refs.]

[Č in CHCl₃ soln. satd. with Cl₂ gives (25) both 1,5-dichloronaphthalene tetrachloride, m.p. 84°, and a trichloronaphthalene dichloride, m.p. 94° (separated by spar. soly. of latter in MeOH).]

[Č on mononitration yields (10) 1,5-dichloro-8-nitronaphthalene [Beil. V-556], yel. pr. from AcOH, m.p. 142° (10) (17) (23); note that the isomeric 1,5-dichloro-3-nitronaphthalene, m.p. 132°, has been reported indirectly (23) (12).]

[Č on monosulfonation (18) (13) gives chiefly 1,5-dichloronaphthalenesulfonic acid-3 [Beil. XI-183, XI₁-(41)] (corresp. sulfonyl chloride, m.p. 143° (13), corresp. sulfonamide, m.p. 204° (24)) accompanied by a smaller amt. 1,5-dichloronaphthalenesulfonic acid-2 [Beil. XI-181] (corresp. sulfonyl chloride, m.p. 125° (13)).]

[C with pieric acid yields a cpd. C.PkOH, m.p. 87° (10).]

[Č on oxidn. with CrO₃/AcOH yields (19) 3-chlorophthalic acid (3:4820) but on oxidn. with dil. HNO₃ yields (20) a nitro-chloro-phthalic acid.] [Č on cat. vapor-phase oxidn. (21) gives 80% yield 3-chlorophthalic anhydride (3:3900) + 20% phthalic anhydride (1:0725).]

ClC(CH₈)₂

M.P. 107° (1) (2)

Odorless tasteless ndls. (from distn. with steam); pr. (from ether); insol. aq.; sol. alc., ether, pet. ether. — Sublimes above m.p.

[For prepn. from α -chloro-isobutyraldehyde (3:7235) by shaking with $\frac{1}{2}$ vol. conc. H_2SO_4 see (1) (2).]

3:3220 (1) Brochet, Ann. chim. (7) 10, 357-359 (1897). (2) Brochet, Bull. soc. chim. (3) 7, 643-644 (1892).

3:3250 2,4-DICHLORONAPHTHOL-1

Ndls. (from dil. alc. or lgr.); from AcOH \bar{C} separates in pr. with 1 mole of AcOH rapidly lost at 40-50° (1). — \bar{C} is volatile with steam; eas. sol. abs. alc. ether or C_6H_6 . — \bar{C} on htg. to 180° decomposes with loss of HCl.

[For prepn. from β -naphthol (1:1500) (1) (2) or 4-chloronaphthol-1 (3:3720) (4) by chlorination see (1) (2) (3); from naphthalene 1,2,3,4-tetrachloride (3:4750) by oxidn. with CrO₃ in AcOH see (5); for other methods see Beil. VI-612.]

 \ddot{C} dissolves in NaOH or Na₂CO₃ but on warming (or even long stdg. in cold) yields (6) ultramarine flocks which impart to ether a violet, and to benzene a deep blue violet, color (6). [Same result obtd. with K₃Fe(CN)₆ but not with pyridine (6).]

Č on boil. with dil. HNO₃ is oxidized (1) to phthalic ac. (1:0820); but with CrO₃ in AcOH yields 2-chloronaphthoquinone-1,4 (3:3580), volatile with steam, golden-yel. ndls. from aq., alc., or AcOH, m.p. 116° (1).

 \tilde{C} is not affected by Sn + alc. HCl (3), or Na/Hg (3), but on htg. in AcOH with conc. HI (D=1.7) for 10 hrs. gives (3) α -naphthol (1:1500).

C dislvd. in 20 pts. 15% aq. KOH and shaken with 4 pts. (CH₃)₂SO₄ gives (94% yield (3)) of the methyl ether, methyl 2,4-dichloro-1-naphthyl ether, colorless ndls. from alc., m.p. 58° (3).

D 2,4-Dichloro-1-naphthyl acetate: from C by htg. with AcCl (2); ndls. (from alc.), m.p. 74-76° (2).

3:3250 (1) Cleve, Ber. 21, 891–893 (1888). (2) Zincke, Ber. 21, 1035–1036 (1888). (3) Franzen, Stäuble, J. prakt. Chem. (2) 103, 384–385 (1921/22). (4) Reverdin, Kauffmann, Ber. 28, 3053 (1895). (5) Helbig, Ber. 28, 506 (1895). (6) Willstatter, Schuler, Ber. 61, 370 (1928).

3:3275 6-CHLORO-2-METHYL-BENZOIC ACID

Beil. S.N. 941

M.P. 108°

102° (2)

[91.5° (3)]

Long slender colorless ndls. from hot aq. (2) or from HCl (1).

[For prepn. of C from 6-chloro-2-methylbenzamide (see below) (itself obtd. from 6-chloro-2-methylbenzonitrile, m.p. 82-83° (2)) by actn. of nitrous acid see (2); from 6-amino-2-methylbenzoic acid (1) via diazotization and use of Cu₂Cl₂ reactn. see (1) (3).]

Č on htg. with aniline, K₂CO₅, and copper powder yields (1) 3-methyldiphenylamine-carboxylic acid-2, cryst. from 50% alc., m.p. 145° dec. (1).

[C melted and treated with Br₂ evolves HBr, and the prod. on warming with dil. NaOH yields (3) 3-chloro-\alpha-hydroxyphthalide, colorless pl. from dil. alc., m.p. 138° (3).]

----- 6-Chloro-2-methylbenzamide: scales from boilg. aq., m.p. 167° (2). [Prepd. indirectly as above.]

3:3275 (1) Gleu, Nitzsche, J. prakt Chem. (2) 153, 213 (1939). (2) Kenner, Witham, J. Chem. Soc. 119, 1458 (1921). (3) Levy, Stephen, J. Chem. Soc. 1930, 2788.

3:3295 3,4-DICHLORONAPHTHOL-2

M.P. 108° (1) (2).

Small colorless ndls. from lgr. Sol. in cold K₂CO₃ soln. (2).

[For prepn. from β -naphthol (1:1540) via 1-nitrosonaphthol-2, chlorination with SO₂Cl₂ in tetrachloroethane to 1-nitroso-3,4-dichloronaphthol-2, reduction to 1-amino-3,4-dichloronaphthol-2 and thence via diazo reaction to \bar{C} see (1); for prepn. from 1,3,4-tri-chloronaphthol-2 by reduction with FeSO₄ + NaOH see (2).]

Č treated with 1 mole HNO₂ yields 1-nitroso-3,4-dichloronaphthol-2, golden-yel. cryst. from AcOH, m.p. not given (1).

3:3295 (1) Marschalk, Bull. soc. chim. (4) 43, 1367 (1928). (2) Herzberg, Spengler, Schmidt (to I.G.), Ger. 431,165, June 30, 1926; Cent. 1926, II 1196.

M.P. 108.5-109 (26) 108-109° (1) cor. (27) (29) 108° (2) (28) 107-108° cor. (3) 107° (4) 106-107° (17) 105-106° (5) 105° (6)

[See also 1,1-dichloro-2,2-bis-(p-chlorophenyl)ethane, "DDD" (3:3320).]

Note that \bar{C} is the remarkable insecticide to which so much publicity is currently being given. Despite the general fanfare the amount of real scientific data which has been released at this writing is small, although very rapid publication is inevitable in the near future. No attempt can be made in this text to cover the utilization of \bar{C} , but attention is drawn to two bibliographies (7) (8) containing respectively 174 and 418 references, although most of these are to general and nontechnical reports. For an extensive review of chemistry of \bar{C} see (30).

[For patents on utilization of "DDT" as insecticide see (9) (10). — For studies of toxicology and pharmacology of "DDT" see (11) (12) (13) (14). — Note that \bar{C} is by rabbits in part excreted as di-(p-chlorophenyl)acetic acid (3:4612), m.p. 166-166.5° u.c. (24).]

Colorless cryst. from 95% alc. — \overline{C} is spar. sol. in 95% alc.; viz., 0.8 wt. % at 0°, 3.9 wt. % at 48° (3); spar. sol. pet. ether of b.p. 30-60° (3); \overline{C} is moderately sol. in CCl₄, ether, or CHCl₃ (3); eas. sol. in pyridine, dioxane, C₆H₆, or acetone (3); for data and graph of wt. % solubility/temp. over range 0-48° see (3) cf. (25); for soly. of \overline{C} in kerosenes see (31). [For detn. of \overline{C} in technical samples, i.e., in pres. of "DDD" (3:3320), by recrystn. from satd. alc. soln. of "DDT" see (26).]

Note that technical \bar{C} may contain some of the isomeric 1,1,1-trichloro-2-(p-chlorophenyl)-2-(o-chlorophenyl)ethane (3:1820) and /or polymers of chloral (3:5210); in fact, technical \bar{C} of setting point 88° contains about 70% \bar{C} accompanied by 18% of the o-p isomer +6% of the o-p isomer (25). — For extensive report on the compn. of technical grade \bar{C} see (29).

[For optical crystallographic props. of C see (28).]

PREPARATION OF C

 \bar{C} is universally prepd. by condensation of chloral or chloral hydrate with chlorobenzene. From chloral hydrate. [For prepn. of \bar{C} from chloral hydrate (3:1270) with chlorobenzene (3:7903) + fumg. H₂SO₄ (8-10% SO₃) (70% yield (2) (4)) or ClSO₃H (77% yield (32)) see indic. refs.]

From chloral. [For prepn. of \bar{C} from anhydrous chloral (3:5210) with chlorobenzene (3:7903) + conc. H_2SO_4 see (6) (15) (16)]

CHEMICAL BEHAVIOR OF C

Reduction of \tilde{C} . \tilde{C} on reduction with Na/alc. gives up all its chlorine quant. detn. of which comprises a method for the quant. detn. of \tilde{C} (14).

[\bar{C} on hydrogenation with $H_2 + Pd/CaCO_3$ in various solvents on slight warming gives according to conditions (18) various products of bimolecular reduction; these include 2,2,3,3-tetrachloro-1,1,4,4-tetra-(p-chlorophenyl)butane, cryst. from AcOEt, m.p. 271.5° (28% yield (18)), both higher-melting (229°) and lower-melting (174°) stereoisomers of 2,3-dichloro-1,1,4,4-tetra-(p-chlorophenyl)butene-2 (former 36% yield, latter in traces) (18), and perhaps other products; for much further study of these reaction products see the original reference (18)]

[C on electrolytic reduction in ale. HCl soln. gives (13% yield (19)) at the cathode 1,1,4,4-tetra-(p-chlorophenyl)butyne-2, pr. from AcOEt, m.p. 174° (19); note that this prod. on oxidn. with CrO₃/AcOH gives (91% yield (19)) 4,4'-dichlorobenzophenone (3:4270), m.p. 145°.]

Oxidation of C. Attempts to oxidize C with CrO₃/AcOH have given (5) no identifiable products.

Dehydrochlorination of C. C under various conditions can be caused to split out 1 HCl yielding 1,1-dichloro-2,2-bis-(p-chlorophenyl)ethylene.

C with alc. KOH refluxed 10 hrs. (5) (6) or 15-20 min. (24) (for study of rate see (20) (27)) gives (yields: almost 100% (24), 81% (5)) 1,1-dichloro-bis-(p-chlorophenyl)ethylene (3:2438) [for use of this reaction by detn. of ionized chlorine as means for detn. of C in spray deposit see (21).]

 \bar{C} with excess Ba(OH)_{2.8}H₂O in ethylene glycol refluxed 10-12 hrs. gives (33% yield (24)) di-(p-chlorophenyl)acetic acid (3:4612), m.p. 166-166.5° u.c.; this results by initial loss of HCl as above and further degradation.

 \ddot{C} in the pres. of minute amts. (e.g., 0.01%) of FeCl₃ or AlCl₃ at 110-120° loses HCl giving (22) cf. (34) 1,1-dichloro-2,2-bis-(p-chlorophenyl)ethylene (3:2438). (See also below under behavior of \ddot{C} with AlCl₃ + C₆H₆.)

SUBSTITUTION REACTIONS OF C

Bromination. No study of the behavior of \bar{C} toward Br₂ appears yet to have been reported.

Chlorination. \tilde{C} in CCl₄ soln. with Cl₂ + trace of PCl₃ in light at b.p. of mixture for 3 hrs. gives (73% yield (5)) 1,2,2,2-tetrachloro-1,1-bis-(p-chlorophenyl)ethane (3:2477), m.p. 91-92° (5).

Nitration. C on introduction of two nitro groups (no details) gives (6) a prod., ndls. from alc., m.p. 148.0-148.3° (29), which is presumably 1,1,1-trichloro-1,2-bis-(4-chloro-2-nitrophenyl)ethane; note that this dinitro compd. has same m.p. as corresp. dinitro deriv. from "o,p-DDT" (3:1820) but m.p. of a mixt. of the two is depressed (29).

Č on tetranitration with a mixt. (1:1 by volume) of fumg. HNO₃ and conc. H₂SO₄ at 100° for 1 hr. gives (23) 1,1,1-trichloro-2,2-bis-(4-chloro-3,5-dinitrophenyl)ethane, m.p. 223.5-224.5° cor. (23). — [Note that similar tetranitration of "DDD" (1,1-dichloro-2,2-bis-(p-chlorophenyl)ethane (3:3320) gives (23) 1,1-dichloro-2,2-bis-(4-chloro-3,5-dinitrophenyl)ethane, m.p. 224.5-225.5° cor. (23); similar tetranitration of the o-p isomer of "DDT" (viz., 1,1,1-trichloro-2-(o-chlorophenyl)ethane) (3:1820) gives a prod., m.p. 229.5-230° cor. (23). — For color reactions of these tetranitro derivs. with MeOH/NaOMe and its use in detn. of Č see {23} (33).]

Behavior with AlCl₃ + C₆H₆. \bar{C} with anhydrous AlCl₃ (1 mole) in large excess of C₆H₆ reacts at room temp. evolving 2 moles HCl and giving (10% yield (1)) 1,1,2,2-tetraphenylethane [Beil. V-739, V₁-(371), V₂-(673)], m.p. 211°. [Note that the mechanism of this surprising result has not yet been explained; that by similar treatment the same tetraphenylethane is also obtd. in 25% yield from 1,1-dichloro-2,2-bis-(p-chlorophenyl)-ethane (3:3320), in 10% yield from 1,1,1-trichloro-2,2-diphenylethane (3:1420), and from the o-p isomer of "DDT" (viz., 1,1,1-trichloro-2-(o-chlorophenyl)-2-(p-chlorophenyl)-ethane) (3:1820), but not at all from 1,1-dichloro-2,2-bis-(p-chlorophenyl)ethylene (3:2438); and that if chlorobenzene is substituted for C₆H₆ no tetraphenylethane results from any of them (1).]

3:3300 2,3,5-TRICHLORO-NAPHTHALENE

M.P. 109.5° (1) (2)

[For prepn. of C from 2,3-dichloronaphthol-8 (3:4315) (2) or from 2,3-dichloronaphthalenesulfonyl chloride-8 [Beil. XI-164] (1) (2) (3) with PCl₅ see indic. refs.]

[C treated with ClSO₃H in CS₂ and reactn. prod. conv. to salts as directed (1) gives salts of 2,3,5-trichloronaphthalenesulfonic acid-8 (corresp. sulfonyl chloride, m.p. 164° (1)).]

3:3300 (1) Turner, Wynne, J. Chem. Soc. 1941, 247, 255-256. (2) Armstrong, Wynne, Chem. News 61, 275 (1890). (3) Armstrong, Wynne, Proc. Chem. Soc. 1890, 83; 1895, 79.

This compd. is closely related to "DDT" (3:3298) and occurs (4) as minor impurity in technical grades of this compound.

[For prepn. of \bar{C} from dichloroacetaldehyde (3:5180) or from 2,2-dichloro-1-(p-chlorophenyl)ethanol (4) with chlorobenzene (3:7903) + conc. H_2SO_4 + fumg. H_2SO_4 (63% yield) see (4).]

C with alc. KOH refluxed 3 hrs. loses 1 HCl giving (77% yield (4)) (5) 1,1-dichloro-2,2-bis-(p-chlorophenyl)ethylene (3:1430).

C on dinitration with 10 vols. fumg. HNO₃ at 50° for ½ hr. gives (90% yield (4)) a dinitro deriv.; cryst. from alc., m.p. 178-179° (4).

 \bar{C} on tetranitration with a mixt. (1:1 by volume) of fumg. HNO₃ + conc. H₂SO₄ at 100° for 1 hr. gives (1) a prod., m.p. 224.5–225.5° cor., which presumably has the structure 1,1-dichloro-2,2-bis-(4-chloro-2,6-dinitrophenyl)ethane.

 \bar{C} with anhydrous AlCl₃ (1 mole) + excess C_6H_6 at ord. temp. evolves HCl and gives (25% yield (2)) 1,1,2,2-tetraphenylethane, m.p. 211° (2).

(8) Armstrong, Wynne, Chem. News 61, 285 (1890).

Colorless (12) or pale greenish-yellow (7) (8) cryst. from hexane + AcCl (1), dry ether (9), lgr. (7) (8), or dry $C_0H_0 + \text{pet.}$ ether (12) (17). — Ord. \tilde{C} frequently conts. two kinds of crysts., white and yellow, both melting at 110-112° (13). — \tilde{C} from CCl₄ cryst. with

1 mole solvent; \bar{C} from acetone cryst. with $\frac{1}{2}$ mole solvent; in both cases solvent is lost at 92° but not readily in air at ord. temp. (24). — [For study of x-ray crystallography of \bar{C} see (25).] — Note that \bar{C} cannot be recrystd. from MeOH or EtOH without more or less complete conversion to the corresp. trityl ethers (see also below under behavior of \bar{C} with alcohols).

 \bar{C} may be stored satisfactorily in ord. screw-top bottles, provided they are well sealed with paraffin (7). — On long exposure to moist air, however, \bar{C} is hydrolyzed (see also below) to triphenylcarbinol (1:5985), m.p. 161-162°; for f.p./compn. diagram of system \bar{C} + triphenylcarbinol, eutectic, m.p. 100°, contg. 90% \bar{C} , see (26). — Samples of partially hydrolyzed \bar{C} may be purified by recrystn. from $\frac{1}{2}$ wt. of C_6H_6 contg. 5-25% acetyl chloride, the latter reconverting the triphenylcarbinol to \bar{C} (7).

 \bar{C} is eas. sol. in other, C_6H_6 (100 g. C_6H_6 dis. 85.8 g. \bar{C} at 25° (35)), CCl₄, CHCl₅, or CS₂, but is much less sol. in pet. ether (19). — Solns. of \bar{C} in acetyl chloride (27) (29), benzoyl chloride (27), hot 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (27) (28), dichloroethylene (28), nitrobenzene (27), SOCl₂ (27), SO₂Cl₂ (29) are yellow; for study of effect of temp. see (27). — Solns. of \bar{C} in liq. SO₂ are also yellow (29) and conduct electric current (30) (31) (32); for study of molecular weight of \bar{C} in liq. SO₂ see (33). — \bar{C} is very sparingly sol. in liq. NH₃ but soln. conducts elect. current (34).

[The protracted arguments on the constitution of \tilde{C} and of trityl derivatives in general (controversy over carbonium and quinonoid forms, etc.) cannot be detailed within the scope of this book; however, for leading references since 1920 see (36) (37) (38) (39) (40) (41) (42) (43) (44) (45); for earlier references see Beil. V-700.]

PREPARATION OF C

The two best-studied preparations of \bar{C} are those from triphenylcarbinol (1:5985) with AcCl (3:7065) in C_6H_6 (93-95% yield (12)) and from CCl₄ (3:5100) with $C_6H_6 + AlCl_3$ (84-86% yield on AlCl₃ used (7) (8)). Note, however, that many other methods have also been used as recorded below.

From triphenylcarbinol (1:5985). [For prepn. of \bar{C} from triphenylcarbinol with AcCl (3:7065) directly (79% yield (46)) or in C_6H_6 soln. (93-95% yield (12)); with oxalyl (di)chloride (3:5060) (47); with HCl gas in dry C_6H_6 (48) (for study of equilibrium see (49)) contg. C_6C_1 (9) or in dioxane at 50° for 22 hrs. (86% yield (14)); with conc. HCl in AcOH (79% yield (50)) or in C_6H_6 + Z_0C_1 (85% yield (51)); with PCl₆ directly (52) or in lgr. (53) or in C_6H_6 (29) or in C_6H_6 + Z_0C_1 (90% yield (51)); with PCl₃ + Z_0C_1 in C_0C_1 (92% yield (51)); with SOCl₂ in C_0C_1 (97% yield (51)); with SiCl₄ in C_0C_1 or lgr. at 40° (54), or with COCl₂ (3:5000) in C_0C_1 (5) see indic. refs.]

From other triphenylcarbinol derivatives. [For prepn. of C from K triphenylcarbinolate with COCl₂ (3:5000) in toluene (5); from triphenylmethoxy—MgBr, (C_6H_5)₃C—OMgBr (from benzophenone + C_6H_5 MgBr), with AcCl in C_6H_6 (37% yield (55)) or with COCl₂ in toluene (14% yield (55)); from triphenylcarbinol ethyl ether (see also below) with AlCl₃ in CS₂ (56) or with AcCl (46) (57) see indic. refs.]

From various other trityl derivatives and relatives. [For prepn. of \bar{C} from α -bromotriphenylmethane (trityl bromide) with AgCl in C_6H_6 in s.t. at 200° for several days (50% yield (57)); from α -aminotriphenylmethane (tritylamine) [Beil. XII-1343, XII₁-(557)] with NH₄Cl in liq. NH₃ (34); from triphenylmethylphosphinic acid [(C_6H_5)₃C(PO)(OH)₂] with PCl₅ (3 moles) at 70° (91% yield (20)); from triphenylmethane (1:7220) with PCl₅ at 160° for 2 hrs. (65% yield (58)) or with NOCl at 150° (59) see indic. refs.]

[For prepn. of \bar{C} from triphenylacetyl chloride [Beil. IX-713, IX₁-(309)] by loss of CO on htg. at 120-150° (60) or at 170-180° (61); from bis-(triphenylmethyl) peroxide [Beil.

VI-716, VI₁-(350)] with $Cl_2 + a$ little I_2 in boilg. CCl_4 soln. for 3 hrs. (40% yield (23)) see indic. refs.

From benzene with various polyhalogenated methanes. [For prepn. of \bar{C} from C_6H_6 (1:7400) with CCl₄ (3:5100) in pres. of AlCl₃ (84-86% yield on AlCl₃ used (7) (8); 70-85% yield (18)) cf. (62) (63) (64) in CS₂ (97% yield (19)) see indic. refs.; for use of FeCl₃ (31% yield against 77% with AlCl₃ under otherwise same conditions (10) cf. (65)) see indic. refs.]

[For prepn. of \bar{C} from C_6H_6 (1:7400) with CHCl₃ (3:5050) + AlCl₃ at 50° see (22).]

[For formn, of \bar{C} from C_6H_6 with dichloro-diffuoro-methane ("Freon") + AlCl₃ see (66).] From various chlorotoluenes. [For formn, of \bar{C} from benzotrichloride (3:6540) with C_6H_6 in pres. of metallic U (67), Ti (68), Ce (69), or Cr (21) see indic. refs.; from benzal (di)chloride (3:6327) with C_6H_6 + AlCl₃ see (22).]

From various chlorodiphenylmethanes. [For formn. of \bar{C} from α -chlorodiphenylmethane (benzohydryl chloride) (3:0060) (22) or from α,α -dichlorodiphenylmethane (benzophenone chloride) (3:6960) (70) with $C_6H_6+AlCl_3$ see indic. refs.]

From other miscellaneous sources. [For formn. of C from pentaphenylethane [Beil. V-755, V_1 -(386), V_2 -(711)] with PCl₅ at 170° for 2 hrs. or refluxed in C₆H₆ (58), or (together with other products) with HCl at 150° (71) or on evapn. of soln. in SO₂Cl₂ (72).]

CHEMICAL BEHAVIOR OF C

Pyrolysis of \bar{C} . \bar{C} on htg. at 200° (52) (73) or 250° (53) or at 150° in pres. of P_2O_5 (74) loses HCl and yields both triphenylmethane (1:7220), m.p. 92°, and 9-phenylfluorene [Beil. V-720, V-1(355), V₂-(630)], m.p. 147-148°; note that 9-phenylfluorene is also formed from \bar{C} in various other reactions such as with POCl₃ on distriction. (23) or with $\frac{1}{10}$ wt. of mossy zinc refluxed in C_6H_6 for 5 hrs. (75).

Reduction of \bar{C} . \bar{C} is reduced to triphenylmethane by many different types of reducing agent [e.g., \bar{C} in anhydrous formic acid (1:1005) at 100° evolves CO_2 + HCl and gives (yield: 79% in 30 min., 90% in 2 hrs (4)) triphenylmethane (1:7220); \bar{C} in EtOII treated with cone. H_2SO_4 at 70–80° gives (76) (17) triphenylmethane accompanied by acetaldehyde (1:0100); \bar{C} is reduced by diethyl ether in the presence of AlCl₃ (56) (77), FeCl₃ (65), or ZnCl₂ (78) to triphenylmethane (1:7220), acetaldehyde (1:0100) and ethyl chloride (3:7015) also being formed; other reagents which effect reduction of \bar{C} to triphenylmethane (1:7220) include hydrazobenzene in boiling C_6H_6 (79), cyclohexadiene-1,3 (dihydrobenzene) + HgCl₂ (80); Zn + AcOH (50) (reaction here is complex, and various other prods. may be formed according to conditions), and dry H_2S at 150° (81)].

Oxidation of \tilde{C} . \tilde{C} is not readily oxidized: \tilde{C} with silver oxide in dry C_6H_6 or ether gives (78) a little fuchsone, $(C_6H_5)_2=C_6H_4=O$ [Beil. VII-520, VII₁-(290)], m.p. 168°, together with other amorphous products difficult to purify; note, however, that \tilde{C} in alcohol-free acetone with KMnO₄ in same solvent instantly reduces the KMnO₄ and gives (100% yield (85)) triphenylcarbinol (1:5985).

Hydrolysis of \tilde{C} . \tilde{C} with aq. hydrolyses to triphenylcarbinol (1:5985) + HCl: e.g., \tilde{C} on shaking with aq. at ord. temp. is 85% hydrolysed in 48 hrs. (26) cf. (82) (83) (in this connection note m.p./compn. diagram (26) of \tilde{C} + triphenylcarbinol); \tilde{C} with boilg. aq. rapidly and completely yields only triphenylcarbinol.

[For study of hydrolysis of \bar{C} by aq. in acetone (84), in dioxane (14), or by aq. HCl (35) see indic. refs.]

 \bar{C} dissolves in cold conc. H_2SO_4 yielding (86) (48) (87) a golden-yellow soln. with evolution of HCl (88) (86) (48) and formn. of triphenylcarbinyl hydrogen sulfate; dilution of this soln. with aq. ppts. (99% yield (86) (48)) triphenylcarbinol (1:5985).

[C dissolves in phenol with deep brown color; on dilution of the freshly prepd. soln. with aq. it becomes colorless and both HCl and triphenylcarbinol are detectable; if, however, the phenol soln. has stood for some time prior to dilution some p-tritylphenol [Beil. VI-731, VI₁-(364)], m.p. 282°, is also formed (89) (see also below under behavior of C with phenols).]

BEHAVIOR OF C WITH OTHER INORGANIC REACTANTS

WITH SALTS OF VARIOUS INORGANIC ACIDS

With Salts of Hydrogen Peroxide

[\bar{C} in acetone with 30% H₂O₂ in freezing mixt. treated with 50% KOH gives (90) trityl hydroperoxide, (C₆H₅)₃C—O—OH (isolated as its addn. cpd. with pyridine hydrochloride, viz., (C₆H₅)₃C—O—OH.C₅H₅N HCl, cryst. from alc., m.p. 133° dec.), accompanied by some triphenylcarbinol (1:5985).]

[\bar{C} in C_6H_6 with aq. Na_2O_2 as directed (91) gives (5-11% yield) bis-trityl peroxide, (C_6H_6)₃C—O—O—C(C_6H_6)₃, cryst. from hot CS₂, m.p. 185-186°, accompanied by much triphenylcarbinol; the bis-trityl peroxide is also obtainable from the trityl hydroperoxide (above) by reaction with \bar{C} in C_6H_6 on addn. of aq. alk. (90).]

With Salts of Halogen Hydrides

With alkali or alkaline-earth salts. [C with alkali fluorides seems not to have been studied; note, however, that trityl fluoride, cryst. from CCl₄, m.p. 104° (6), has been prepd. by other means, viz., from triphenylcarbinol with HF (6) or with acetyl fluoride (85).]

[\overline{C} with anhydrous CaBr₂ in C₆H₆ at room temp. for 5-6 hrs. (92) or \overline{C} with HBr in C₆H₆ at room temp. for 20 hrs. (92) is largely converted to trityl bromide [Beil. V-704, V₁-(348), V₂-(617)], m.p. 152°.]

[For study of rate of reaction of \bar{C} with KI in dry acetone at 0° see (93); note, however, that, although trityl iodide [Beil. V-706], m.p. 132°, is doubtless formed, yet more or less sepn. of I₂ and formn. of triphenylmethyl (or its reaction prods.) occurs also.]

With metal chlorides. \bar{C} with many metallic chlorides forms double salts [e.g., \bar{C} with AlCl₃ forms (19) (87) a cpd., \bar{C} .AlCl₃, dark-yellow very hygroscopic cryst. from nitrobenzene + CS₂, dec. abt. 122-125°; \bar{C} in nitrobenzene with SnCl₄ gives on addn. of dry CS₂ or.-yel. cryst. of a cpd., \bar{C} .SnCl₄ (30) (57) (87) (94); \bar{C} with SbCl₅ gives (57) a cpd., \bar{C} .SbCl₅, red cryst.; \bar{C} with BCl₃ gives a cpd., \bar{C} .BCl₃ (6), etc.].

With Salts of Hydrogen Sulfide

[\bar{C} with alc. NaSH (from alc. NaOEt satd. with H₂S) (81) cf. (95) (96), or \bar{C} with KSH in C₆H₆ (96), gives triphenylthiocarbinol [Beil. VI₁-(352)], cryst. from abs. alc. or alc. + CHCl₃, m.p. 107° (81) (95). — \bar{C} with alc. Na₂S as directed gives (21% yield (95)) bistrityl sulfide, m.p. 182° dec. — Note also that bis-trityl disulfide, cryst. from C₆H₆ + pet. ether, m.p. 157° dec. (95) [Beil. VI₁-(353)], is also known but prepd. indirectly (81) (95) (96).]

With Other Salts of Inorganic Acids

[\bar{C} with Ag₂SO₄ in liq. SO₂ (23), C₆H₆ (97), or at 120-130° for 15-20 min. (98) cf. (48) gives di-trityl sulfate [Beil. VI-717, VI₁-(351)]. — \bar{C} with AgClO₄ in nitrobenzene + C₆H₆ gives (99) trityl perchlorate [Beil. VI-717, VI₁-(351)]. — \bar{C} with AgCrO₄ in C₆H₆ gives (48) cf. (100) di-trityl chromate [Beil. VI-717]; note that this salt is also obtd. from \bar{C} with CrO₃ in C₆H₆ or CCl₄ (101).]

[\bar{C} with NaN₃ in C₆H₆ refluxed 20 hrs. gives (100% yield (102)) trityl azide [Beil. V-708, V₁-(349), V₂-(618)], colorless cryst., m.p. 64° (102), 65° (103). — For study of reaction of \bar{C} with silver hyponitrite and decompn. of the transient trityl hyponitrite see (104).]

WITH METAL OXIDES

[\bar{C} with HgO in dry C_6H_6 , ether, CS_2 , or CHCl₃ as directed (78) cf. (105) (106) gives (50-85% yield (78)) di-trityl oxide, cryst. from xylene, m.p. 237-238° (106), 235-237° (78) (105). — Note that \bar{C} with Ag_2O in C_6H_6 undergoes oxidation (cf. above); note that \bar{C} with CrO_3 in C_6H_6 or CCl_4 gives (101) di-trityl chromate [Beil. VI-717].]

WITH METALS

With alkali metals (or their amalgams). [\bar{C} in dry ether with 1% Na/Hg on shaking at room temp. (2) (8) (107) (108) (109) or \bar{C} with Na in liq. NH₃ (112) gives tritylsodium (sodium triphenylmethyl) [Beil. XVI₁-(589)]. \bar{C} with K in liq. NH₃ gives (112) tritylpotassium. — \bar{C} in dry ether with excess Li/Hg, Rb/Hg, or Cs/Hg in absence of air gives (113) corresp. trityllithium, tritylrubidium, or tritylcesium. — For behavior of \bar{C} with calcium in liq. NH₃ see (112). — In this connection note that \bar{C} in dry ether, C₆H₆, or CS₂ in absence of air and under CO₂ with molecular Ag (91) cf. (117), Hg (91), Zn (91) (114) (115), or \bar{C} with Cu bronze in C₆H₆ + EtOAc (116) or in s.t. at 80–110° in dark (117) gives triphenylmethyl (trityl); note also that \bar{C} with Zn + AcOH in the cold gives (50) triphenylmethane (1:7220) + trityl, but the same mixture if heated gives triphenylmethane + 1-benzohydryl-4-tritylbenzene [Beil. V-761], m p. 231° (118), 230° cor. (119), the latter under certain conditions attaining as high as 70% (50) (118).]

With Zn. [\bar{C} with $\frac{1}{10}$ wt. of mossy zinc refluxed in C_6H_6 for 5 hrs. gives (75) 9-phenyl-fluorene (see also above under pyrolysis of \bar{C}). — For behavior of \bar{C} with Zn in EtOAc see (120).]

With Mg (in dry ether). \bar{C} with Mg in dry ether in the pres. of I₂ as directed gives (96% yield (13)) cf. (121) of corresp. R—Mg—Cl cpd., viz., trityl—Mg—Cl [Beil. XVI-942, XVI₁-(556)]. — [The former controversy as to whether this can exist in a more reactive quinonoid structure (α) or a relatively less reactive carbonium (β) structure cannot be reported here (for references see above Beilstein citation), nor can space be taken for a full account of its reactions.] — Note, however, that this RMgCl cpd. with CO₂ gives (yields: 91% (2), 87.5% (121)) (122) (59) triphenylacetic acid [Beil. IX-712, IX₁-(309)], m.p. 264-265° dec. (122); for study of adverse influence of triphenylcarbinol or of benzaldehyde see (121).

WITH NITROGENOUS INORGANIC REACTANTS

[\bar{C} dislvd. in C_6H_6 and satd. with dry NH₃ gas (123) (124) repeatedly (125), or \bar{C} in naphthalene with dry NH₃ gas at 130° (126), gives (45% yield (126)) tritylamine (triphenylmethyl-amine) [Beil. XII-1343, XII₁-(557)], pr. from abs. alc., m.p. 102° (126), 103-104° (124), 105° (127) (corresp. B.HCl, spar. sol. aq., m.p. 244° (127)).]

[\bar{C} with NH₂OH (from NH₂OH.HCl in MeOH/NaOMe) in C₆H₆ gives (73–75% yield (3)) (128) cf. (129) N-tritylhydroxylamine [Beil. XV-33, XV₁-(11)], pr. from C₆H₆/pet. ether, m.p. 130–135° (3), 124–135° u.c. (128); for study of rearr. of this prod. see (129). — For study of N-methyl ether of this prod., viz., N-trityl-N-methylhydroxylamine (similarly prepd. from \bar{C} with N-methylhydroxylamine) see (130) (131); for study of the isomeric O-methyl ether, viz., N-trityl-O-methylhydroxylamine (from \bar{C} with methoxyamine), see (132).]

[\bar{C} with hydrazine hydrate (2 moles) in alc. at ord. temp. (232) or in dry ether under reflux (233) or in dry pyridine at 45–50° (234) gives (63% yield (234)) N,N'-di-tritylhydra-

zine $(\alpha,\alpha'$ -hydrazotriphenylmethane) [Beil. XV-582, XV_I-(184)], m.p. 212° (234), 219–220° dec. (235), often accompanied (232) (233) by some N-tritylhydrazine [Beil. XV-581, XV_I-(184)].

BEHAVIOR OF C WITH ORGANIC REACTANTS

WITH ORGANIC HYDROXY OR MERCAPTO COMPOUNDS

With Alcohols

Č with alcohols gives the corresp. ethers of triphenylcarbinol. With the lower monohydric alcs. this conversion can occur merely on solution and warming, but higher alcs. usually require htg., use of metal alcoholate, use of an acid acceptor (pyridine), etc.

With methyl alcohol. \bar{C} with MeOH (1:6120) in C_6H_6 for 10 min. (133), or \bar{C} with MeOH/NaOMe refluxed 4 hrs. (134), gives (55% yield (134)) triphenylcarbinyl methyl ether (α -methoxytriphenylmethane), cryst. from MeOH, m.p. 83.5-84° (133), 82.5-83° (134), 82.6-82.9° (134) (136), 82° (64); note, however, that this product exists in dimorphous forms; the lower-melting form just mentioned sometimes (134) (135) changes to a higher-melting form, m.p. 96.0-96.5° (134) (135); note also that the m.p. of this methyl ether close to that of the ethyl ether (see below) but that a mixed m.p. of the two is depressed (136). —[For studies of hydrolysis of the methyl trityl ether to triphenylmethane (1:7220) and formaldehyde (1:0145) see (134) (136); for prepn. of its addn. cpd., m.p. 90-91°, with PkOH see (138)]

With ethyl alcohol. \bar{C} with abs. EtOH (1:6130) on warming (1) (4) (5) (52) or even shaking 1 min. at ord. temp. (139), or \bar{C} with abs. EtOH/NaOEt (9) (56) (134) (139), gives (yields: 83% (138), 50% (134)) triphenylearbinyl ethyl ether (a-ethoxytriphenyl-methane), cryst. from abs. alc., ether, or pet. ether, m.p. 84° (5), 83° (1) (9), 81.2-81.8° (134), 81.3° (56), 81° (4). — Note that the m.p. of this prod. is almost identical with that of triphenylearbinyl methyl ether (above) but that a mixed m.p. of the two is depressed (137). — [For study of pyrolysis of this ethyl trityl ether yielding triphenylmethane (1:7220) and acetaldehyde see (134) (136); for study of its cleavage with AcCl (3:7065) (57) (46), with AlCl₃ in CS₂ (56), or with EtOH/HCl (26) see indic. refs.; for conversion with boilg. anhydrous formic acid to triphenylmethane (1:7220) see (4).]

With other monohydric alcs. $|\bar{C}|$ with n-PrOH (1:6150) in dry pyridine at room temp. for 20 hrs. (140), or \bar{C} with n-PrOH/NaO n-Pr refluxed 4 hrs. (134), gives (10% yield (134)) trityl n-propyl ether, cryst. from n-PrOH/pet. ether, m.p. 55° (140), 50.5-52.5° (134). — \bar{C} with isopropyl alc. (1:6135) in dry pyridine at room temp. for 20 hrs. (140) or \bar{C} with isopropyl alc./Na isopropylate under reflux gives (50% yield (134)) trityl isopropyl ether, m.p. 113° (140), 112.9-113.8° (134), 111.7° (56). — \bar{C} with n-BuOH (1:6180) + sodium n-butylate gives (40% yield (134)) trityl n-butyl ether, oil, b.p. 196-198° at 5 mm. (134). — For prepn. of corresp. trityl ethers from sec.-butyl alc. (1:6155) (134), isobutyl alc. (1:6200) (134), cetyl alc. (1:5945) (140), allyl alc. (1:6145) (140), benzyl alc. (1:6480) (134), cyclohexanol (1:6415) (140), see indic. refs.]

[For prepn. of corresp. trityl ethers from l-menthol (1:5940) (152) (153) (154), d-borneol (1:5990) (152) (153), or cholesterol (1:5975) (152) see indic. refs.]

[Note, however, that \bar{C} with K triphenylcarbinolate does not give the expected prod. but rather (96) p-hydroxytriphenylcarbinol in the form of its anhydride fuchsone; the expected ditrityl ether has been obtd. from \bar{C} by action of HgO (see above).]

With various important substituted monohydric alcohols. [\bar{C} with β -methoxyethanol (methyl "cellosolve") (1:6405) in pyridine gives (80-85% yield (141)) trityl β -methoxyethyl ether, m.p. 105.5-106.0° u.c. (141), 104° (142). — \bar{C} with β -ethoxyethanol ("cellosolve") (1:6410) in pyridine at 100° for 5 hrs. gives (92% yield (141)) trityl β -ethoxyethyl

ether, m.p. 79.0–79.5° u.c. (141), 77–78° (143). — $\bar{\rm C}$ with β -isopropoxyethyl alc. (isopropyl "cellosolve") (1:6413) in pyridine gives (50–60% yield (141)) trityl β -isopropoxyethyl ether, m.p. 71.0–71.5° u.c. (141). — $\bar{\rm C}$ with β -benzyloxyethyl alc. (benzyl "cellosolve") (1:6533) in pyridine gives (50–70% yield (141)) trityl β -benzyloxyethyl ether, m.p. 76–77° u.c. (141). — $\bar{\rm C}$ with β -phenoxyethyl alc. (phenyl "cellosolve") (1:6518) in pyridine gives (75–85% yield (141)) trityl β -phenoxyethyl ether, m.p. 123.5–124.0 u.c. (141).

[C with β -(β -methoxyethoxy) ethyl alc. (methyl "carbitol") (1:6458) in pyridine gives (55-60% yield (141)) trityl β -(β -methoxyethoxy) ethyl ether, m.p. 58-59° u.c. (141). — Note that the trityl ethers of β -(β -ethoxyethoxy) ethyl alc. ("carbitol") (1:6470) and of β -(β -n-butoxyethoxy) ethyl alc. (butyl "carbitol") (1:6517) are unreported.]

With various polyhydric alcohols. (For \bar{C} with carbohydrates see separate section below.)

[Č with ethylene glycol (1.6465) in pyridine may according to conditions (141) give either or both of the two possible ethers, viz., ethylene glycol monotrityl ether, m.p. 105-105.5° u.c. (141), 104.5-105.5° (144), 102-103° (143), 98-100° (140) (corresp. benzoyl deriv. m.p. 58.5-59.5° (144); corresp. p-nitrobenzoyl deriv., m.p. 155-156° (144)), and/or ethylene glycol ditrityl ether, m.p. 190° u c. (145), 187-188° u.c. (141), 185-186° (140).]

[C with propylene glycol (propanediol-1,2) (1:6455) in pyridine gives (146) propylene glycol ditrityl ether, m.p. 176.5-177.0° u.c. (146).]

[Č (2 moles) with diethylene glycol (1:6525) in pyridine gives (60-70% yield (141)) diethylene glycol ditrityl ether, m.p. 157.5-158.0° u.c. (141); note that corresp. diethylene glycol monotrityl ether has m.p. 112.5-113.5° u.c. (141).]

[C (2 moles) with triethylene glycol (1:6538) in pyridine gives (45-60% yield (141)) triethylene glycol ditrityl ether, mp. 142.0-142.5° u.c. (141); note that this prod. is dimorphous, and an unstable form, m.p. 130.5-131.5° u.c., sometimes obtd. can be converted to the stable higher-melting form by htg. at 125° or by grinding in acetone (141).]

[Č with glycerol (1:6540) may give mono-, di-, or tritrityl ethers acc. to conditions; glycerol α -monotrityl ether, m p. 93-94° (147), 92-94° (140), but also sometimes in another form of m.p. 108-110° (147) (148), 109-110° (149); glycerol α , α' -ditrityl ether, m.p. 174-177° (150), 174-176° cor. (151), 170-171° (140); glycerol α , α' , β -tris-trityl ether, m.p. 196-197° (147) (150). — Note that the relationships of these three ethers are subtle; e.g., the monoether at 180-190° is converted (147) into the α , α' -diether; the latter in turn at 260° gives (147) the triether.]

[\bar{C} (4 moles) with pentaerythritol (1:5850) in pyridine gives (145) a tetratrityl ether m.p. above 350°.]

With carbohydrates and their relatives. $\bar{\mathbf{C}}$ has recently been much employed as a tritylating agent for compounds of the carbohydrate group. This use started from the original (erroneous) impression that $\bar{\mathbf{C}}$ etherified hydroxyl groups only if the latter were primary. However, although $\bar{\mathbf{C}}$ does in general react preferentially with such primary hydroxyls, and this reaction has been proposed (155) as a means for the detection of primary alcs. in the presence of secondary and/or tertiary alcohols, yet such primary tritylation is *not* specific. Abundant evidence is already available (156) (157) (158) (159) that secondary hydroxyl groups undergo tritylation. Although the scope of this book cannot be extended to a detailed treatment of the use of $\bar{\mathbf{C}}$ as tritylating agent in the carbohydrate group, yet a few brief citations may be of service as leading references.

With various tetrahydric alcohols. [For behavior of \tilde{C} with meso-erythritol (1:5825) and pentaerythritol (1:5850) see [145].]

With various pentahydric alcohols and pentoses. [For behavior of \bar{C} with adonitol, arabitol, xylitol, fucitol, rhamnitol, and epirhamnitol see (145); with arabinose, ribose, and xylose see (160); with various derivatives of these see (158) (167) (168).]

With various hexahydric alcohols and hexoses. [For behavior of \bar{C} with mannitol (145) (161), sorbitol (145), dulcitol (162) see indic. refs.; with d-glucose (163) (164) (165), with d-galactose (165), with fructose (160) (166); with various derivs. of these see (159) (169) (152) (170) (171) (172) (173).]

With various disaccharides. [For behavior of \bar{C} with sucrose (174), maltose (174), turanose (175) see indic. refs.]

With various polysaccharides. [For behavior of C with raffinose (174), glycogen (176), starch (177), cellulose (177), and arabogalactan (178) see indic. refs.]

With thiols (for thiophenols see below). \bar{C} with mercaptans yields the corresp. trityl thioethers [e.g., \bar{C} with MeSH in dry ether or C_6H_6 gives (179) (180) trityl methyl sulfide [Beil. VI₁-(352)], lfts. from MeOH, m.p. 105° (179); \bar{C} with EtSH similarly gives (179) (180) trityl ethyl sulfide [Beil. VI₁-(353)], m.p. 125° (179). — \bar{C} with Na triphenylthiocarbinolate in alc. on htg. gives (95) ditrityl sulfide, m.p. 182° dec. (also obtd. from \bar{C} + abs. alc. Na₂S) — For tritylation with \bar{C} of SH groups in mercaptoacetic acid, α -mercaptopropionic acid (thiolactic acid), β -mercaptopropionic acid (thiohydracrylic acid, α -mercaptosuccinic acid (thiomalic acid) see (180)].

With phenols. Č with phenols (as with alcohols) gives in general the corresp. trityl ethers; however, with phenols there is a further complication in that either rearrangement of the trityl radical of the ether or direct nuclear alkylation by the trityl radical of Č (or both) may occur according to the conditions employed, the latter reaction being profoundly favored by dissociating solvents.

With phenol (or its salts). [Č with KOC₆H₆ (89) (181) cf. (182) or NaOC₆H₅ (139) (182) in dry ether gives (yields: 90% (139), 71% (181), 70% (182)) trityl phenyl ether (α-phenoxytriphenylmethane) [Beil. VI-716, VI₁-(350)], mp 103° (89) (165) (181), 102° (139) accompanied by some p-tritylphenol (4-hydroxytetraphenylmethane) [Beil. VI-731, VI₁-(364)], m.p. 282° (182), 280° (179); note that the latter, which under favorable circumstances may represent as much as 74% yield (182), may be separated from the former by use of "Claisen's alkali" (182), was originally (89) overlooked; note, also, that Č with phenol (1:1420) in pyridine at 100° for 3½ hrs. gave 28% yield (165) trityl phenyl ether, while Č with phenol at 130-140° for 4 hrs. gave (182) cf. (179) only 1.5% of this product and 98.5% of the isomeric p-tritylphenol.]

With the 3 cresols. [\bar{C} with o-cresol (1:1400) in pyridine at 110° for 5-6 hrs. (183) (181) (184) or \bar{C} with sodium o-cresolate in dry ether refuxed 2 hrs. (183) gives (yields: 31-53% (183) trityl o-tolyl ether, m.p. 112-113° (183) (181), 112 5° (184), accompanied by as much as 26% (183) of the isomeric nuclear tritylation prod., 4-trityl-2-methylphenol, m.p. 186° (185), 185° (181), 183° (183) (186), 182-183° (187); \bar{C} with sodium o-cresolate in excess o-cresol at 120° for $3\frac{1}{2}$ hrs. (183) or \bar{C} with o-cresol at 180° for 5 hrs. (181) or in pres. of $ZnCl_2$ at 180° for $\frac{1}{2}$ hr. (181) gives (33% yield (183)) 4-trityl-2-methylphenol. — Note that this latter cryptophenol was originally (181) (183) (184) supposed to possess the structure α -(o-hydroxyphenyl)- β , β , β -triphenylethane, but this erroneous view has since (186) (187) cf. (188) (189) (195) been corrected.]

[\overline{C} with the sodium salt of *m*-cresol (1:1730) in dry ether under reflux 2 hrs. gives (53% yield (185)) trityl *m*-tolyl ether, m.p. 101° (185), none of the expected nuclear tritylation prod., viz., 4(or 2)-trityl-3-methylphenol being found although the latter has subsequently (190) (186) been otherwise obtained and found to have m.p. 213-214° (190), 213° (186).]

[\overline{C} with p-cresol (1:1410) in dry pyridine at 100° for 7 hrs. (181) or 5 hrs. (191) (26) or \overline{C} with sodium p-cresolate in dry ether refluxed 2 hrs. (185) gives (yields: 80% (191), 50-60% (185)) trityl p-tolyl ether, the latter being definitely trimorphous and occurring in three forms; viz., m.p. 114° (185), 113-114° (191) (192) (26); m.p. 95° (193) (194); and m.p. 81° (181) (193) (194) (note that the lower-melting forms tend to convert to the 114°

type (194)) accompanied by a trace of a cryptophenol, presumably 2-trityl-4-methylphenol, m.p. 182° (185) (190), also obtd. (64% yield (190)) from $\bar{\rm C}$ with sodium p-cresolate in excess p-cresol at 130-140° for 3 hrs.]

With other phenols. [For further examples of nuclear tritylation of phenols by use of C with isochavibetol and isoeugenol see (196) cf. (26); with 2-hydroxynaphthoquinone-1,4 see (197). — For form. of di-trityl ethers from pyrocatechol (1:1520) (140) or from hydroquinone (1:1590) (198) see indic. refs.]

With thiophenols. \tilde{C} with thiophenol on htg. (199) or in C_6H_6 soln. on refluxing $\frac{1}{2}$ hr. (180) (179), or \tilde{C} with $NaSC_6H_6$ in ether at ord. temp. for 18 hrs. (200) (201), gives (yield alm. quant. (199) (200), 96% (180)) trityl phenyl sulfide, m.p. 106.5° (180), 106° (201), 105–106° (199) (200), 105° (179); this prod. on oxidn. with $CrO_3/AcOH$ gives (199) the corresp. sulfoxide, m.p. 163°, but is unaffected by H_2O_2 (199) [for corresp. sulfone, m.p. 175–176° (210), see below under reaction of \tilde{C} with salts of organic acids (sodium benzene-sulfinate)].

[For corresp. sulfides from \bar{C} with o-thiocresol, p-thiocresol, α -thionaphthol, β -thionaphthol, 2,4-dinitrothiophenol see (201).]

With enols or enolates. [For examples of reaction of $\tilde{\mathbf{C}}$ with the enol form of diphenylacetaldehyde (202), methyl diphenylacetate (202), or with stilbenediol bis-MgI cpd. (203) see indic. refs.]

Behavior of C with Ethers

 \bar{C} with various aliphatic ethers in the pres. of suitable catalysts yields triphenylmethane and an aldehyde [e.g., \bar{C} with diethyl ether in the pres. of AlCl₃ (56) (77), FeCl₃ (65), or ZnCl₂ (78) gives triphenylmethane and acetaldehyde; although the latter is lost by polymerization the method is standard (77) for prepn. of triphenylmethane (1:7220)].

[Note, however, that with aromatic ethers nuclear tritylation occurs: e.g., \bar{C} with anisole (1:7445) + SnCl₄ at 100-110° for 1 hr. gives (45% yield (204)) 4-tritylanisole, m.p. 200.5° (204).]

BEHAVIOR OF C WITH ORGANIC ACIDS

(For salts of organic acids see below.)

 \bar{C} with AcOH even at 13° (133) (146) cf. (50) is in equilibrium with trityl acetate (see below) + HCl. — \bar{C} with thiolacetic acid (CH₃COSH) gives trityl thiolacetate [Beil. VI-721, VI₁-(353)], m.p. 138° (179). — \bar{C} with thiolbenzoic acid (C₆H₅COSH) in toluene gives (85% yield (180)) trityl thiclbenzoate [Beil. IX-422, IX₁-(170)], m.p. 187.5-188° (180). — \bar{C} with free thiocyanic acid in C₆H₆ gives (97% yield (180)) trityl thiocyanate, m.p. 139° (180) (see also below).

BEHAVIOR OF C WITH SALTS OF ORGANIC ACIDS

C with salts of organic acids normally reacts to yield the corresp. trityl esters.

 \bar{C} with AgOAc in dry ether or C_6H_6 on shaking at room temp. (57) or in C_6H_6 refluxed 2 hrs. (46), or \bar{C} shaken with NH₄OAc in C_6H_6 at ord. temp. (205), gives trityl acetate, cryst. from AcOEt + lgr., m.p. 87-88° (46) (57). — \bar{C} with AgOBz in C_6H_6 at 60° for 4 hrs. gives (96) trityl benzoate, m.p. 165-166° (96). — Note that in analogous fashion \bar{C} might be expected to react with silver salts of *p*-nitrobenzoic and 3,5-dinitrobenzoic acids to give corresp. esters, but these are unreported.

[Č with excess dry Ag₂CO₃ in dry C₆H₆ shaken 24 hrs. gives (60-80% yield (106)) (105) ditrityl carbonate, cryst. from xylene, m.p. 209° dec. (106), 205-210° (105); this prod. on htg. in xylene in pres. of Cu pdr. decomposes (106) (105) into CO₂ and ditrityl ether, m.p. 237-238° (106) (see also above under Č with HgO).]

[C with excess Hg(CN)2 at 150-170° for 1 hr. gives (alm. 100% yield (53)) on extraction

with C_6H_6 (53) (206) (207) trityl cyanide (triphenylacetonitrile) [Beil. IX-714, IX₁-(309)], pr. from AcOH, m.p. 129° (208), 127.5° (53).]

[C with mercury fulminate in dry C₆H₆ under cooling gives (65% yield (208)) trityl cyanide oxide, (C₆H₆)₃CNO, ndls. from alc., m.p. 153-154° (208).]

[Č with KSCN in dry C₆H₆ shaken at room temp. for 2 days gives (209) trityl thiocyanate [Beil. VI-721], m.p. 137° (209) (see also above under Č with organic acids (HSCN)).]

[\bar{C} with sodium benzenesulfinate in dry ether gives (210) trityl phenyl sulfone [Beil. VI-721], lfts. from ether, m.p. 175–176° (210); note that corresp. sulfoxide (see above under behavior of \bar{C} with thiophenol) has m.p. 163°. — Similarly, \bar{C} with sodium *p*-toluenesulfinate in dry C_6H_6 gives (179) trityl *p*-tolyl sulfone [Beil. VI₁-(353)], m p. 173° (179).]

BEHAVIOR OF C WITH ORGANOMETALLIC COMPOUNDS

This topic cannot be fully expanded within the scope of this book, but the following examples will serve as leading references.

With organo-alkali compounds. [\bar{C} with L₁ n-butyl in pet. ether for 9 days gives (26% yield (211)) 1,1,1-triphenylpentane, m.p. 153-154° (211). — \bar{C} with Li C_6H_5 gives (212) free trityl isolated in form of (20% yield) ditrityl peroxide.]

[\bar{C} with Na *n*-butyl or Na trityl in liq. NH₃ + toluene (112) or \bar{C} with Na trityl in dry ether (108) gives free trityl. — \bar{C} with Na + tetraphenylethylene as directed gives (213) pentaphenylethyl.]

With RMgX compounds. \bar{C} with MeMgBr (214) or \bar{C} with MeMgI (215) gives no gas (216) cf. (217) (218) but couples giving (yields: 95% (214), 70% (215)) 1,1,1-triphenylethane (α -methyltriphenylmethane) [Beil. V-709, V₁-(350)], cryst. from alc., m.p. 94-95° (214) (215), 94.8-950° (15); note that this prod. is also obtd. from MeMgBr with trityl acetate (61% yield (219)) or from K trityl with MeI in liq. NH₃ (85-94% yield (220)).

[C with EtMgBr in dry ether reacts rapidly and quant. (221) yielding (215) not only the expected 1,1,1-triphenylpropane [Beil. V-712], m.p. 51° (215), but also (215) triphenylmethane (1:7220) and ethylene]

[C with n-PrMgBr in dry ether gives (215) not only 1,1,1-triphenylbutane, m.p. 79° (215), but also considerable triphenylmethane (1:7220). — C with iso-PrMgBr in dry ether gives (215) not only 1,1,1-triphenyl-2-methylpropane, b.p. 233-234° at 21 mm. (215), but also much triphenylmethane (1:7220)]

[\bar{C} with C_6H_5MgBr in dry ether or C_6H_6 gives a small yield (25-30% (222), 10-12% (139), 5-10% (215) (223)) tetraphenylmethane [Beil. V-738, V₁-(371), V₂-(672)], m.p. 281-282° (224) (225), b p. 431° at 760 mm. (225), but the principal product (yield: 50-77% (222), 47.4% (226)) is 4-benzohydrylbiphenyl (p-phenyltetraphenylmethane) [Beil. V-738, V₂-(672)], m.p. 111° (226), 112-113° (116); for explanation and study of this reaction see (222). — Note that \bar{C} with C_6H_5MgI behaves differently giving (227) cf. (179) triphenylmethyl and biphenyl (1:7175).]

[\bar{C} in C_6H_6 with benzyl MgCl in dry ether gives (100% yield (215)) (228) 1,1,1,2-tetraphenylethane [Beil. V-740, V₁-(372), V₂-(674)], m.p. 144° (215), 143.5-143.7° (15). — \bar{C} with benzohydryl bromide + Mg in dry ether (215) cf. (230) (or better trityl MgBr + benzohydryl bromide (229) cf. (230)) gives (90% yield (229)) pentaphenylethane [Beil. V-755, V₁-(386), V₂-(711)], m.p. in air 166-178° (229), in N₂ 182-185° (229). — \bar{C} with trityl MgCl gives (230) free trityl.]

[For behavior of C with phenylacetylenyl MgBr giving trityl-phenylacetylene or with acetylene-bis-MgBr giving di-tritylacetylene (hexaphenylbutyne-2) see (231).]

BEHAVIOR OF C WITH (ORGANIC) AMINES

(For \tilde{C} with NH₃, NH₂OH, NH₂NH₂, etc., see above under \tilde{C} with inorganic nitrogen compds; for \tilde{C} with arylhydrazines see below.)

C with Primary Amines

[Č with MeNH₂ in C₆H₆ in pres. of NaOMe gives (125) trityl-N-methylamine [Beil. XII-1344, XII₁-(557)], m.p. 73° (125) (236) (corresp. B.HCl, m.p. 216° (125)).]

With aromatic prim. amines. \bar{C} in C_6H_6 with aniline in alc. refluxed 15 min. gives (80% yield (228)) (57) N-tritylanıline [Beil. XII-1344, XII₁-(557)], cryst. from alc./ether, m.p. 149-150°, (57), 148-149° (237), 146° (228) [note that this prod. with ½ its wt. ZnCl₂ at 160° for 15 min. rearranges (228) to p-tritylaniline [Beil. XII-1348], ndls. from toluene or alc., m.p. 256° cor. (225), 249° (228); note also that \bar{C} is claimed to form with aniline an addn. cpd., m.p. 189-190° (34)].

[$\bar{\mathbf{C}}$ in $\mathbf{C}_6\mathbf{H}_6$ with o-toluidine in alc. refluxed 15 min. gives (228) N-trityl-o-toluidine, m.p. 142.5° (228), 142° (237) (238), 140–142° (57); this prod. with $\mathbf{ZnCl_2}$ at 160° for 15 min. rearranges (82% yield (189)) (228) to 4-trityl-2-methylaniline, m.p. 216° (228), 215° (189) (not to α-(2-amino)- β , β , β -triphenylethane as originally supposed (228) cf. (189)). — $\bar{\mathbf{C}}$ with m-toluidine directly has not been studied nor has the other expected product, viz., N-trityl-m-toluidine, nor its rearr. prod., been reported. — $\bar{\mathbf{C}}$ in $\mathbf{C}_6\mathbf{H}_6$ with p-toluidine in alc. refluxed 15 min. gives (228) N-trityl-p-toluidine [Beil XII-1344], m.p. 180° (228), 177–178° (85), 177° (238), 176° (237): this product with $\mathbf{ZnCl_2}$ at 190° for 30 min. does not (228) rearrange.]

[Č with p-aminobiphenyl (p-xenylamine) in C_6H_6 on htg. gives (82% yield (239)) N-trityl-p-xenylamine, pr. from C_6H_6 , m.p. 179.5-180.5° (239); note that this prod. does not rearrange]

C with Secondary Amines

With aliphatic sec. amines. $[\bar{C} \text{ with } Me_2NH \text{ in } C_6H_6 \text{ gives } (65\% \text{ yield } (240)) \text{ trityl-dimethyl-amine, cryst. from abs. alc., m.p. } 95-97^{\circ} (240), 97^{\circ} (236).]$

With aromatic sec. amines. $[\bar{C}]$ with diphenylamine might first be expected to give N-trityl-diphenylamine, ndls. from toluene, m.p. 172° (241), which has actually been prepd. by other means (241) (242) (243); however, \bar{C} with diphenylamine (244) in hot C_6H_6 (243) or pyridine (165) or the above N-trityl-diphenylamine with diphenylamine HCl in C_6H_6 or in hot AcOH directly (243) gives the rearr. prod., viz., 4-trityl-diphenylamine (4-anilinotetraphenylmethane), m.p. 242° (243) (244), 240° (165). — For use of these and related prods. as antioxidants see (244) (245). —For analogous behavior of \bar{C} with di-p-tolylamine, di-p-amylamine, and di-(p-dimethylaminophenyl)amine see (243).]

[For behavior of \tilde{C} with N,N-diphenyl-p-phenylenediamine yielding a blue meriquinoid salt, m.p. 182-183°, see (246) (247) (248); with indole and with 2-methylindole giving N-trityl derive. see (196).]

With heterocyclic sec. amines. [C with piperidine in C₆H₆ yields (179) N-tritylpiperidine, ndls. from alc., m.p. 153° (179).]

C with Tertiary Amines

With aliphatic ter-amines. [\bar{C} with Me₃N in acetonitrile + CHCl₃ at room temp. ppts. a prod., m.p. 190–195° dec. (249), of compn. $2(C_6H_5)_3COH$. (CH₃)₃ N.HCl from which extraction with aq. leaves triphenylcarbinol (1:5985), m.p. 161°, or from which extraction with C₆H₆ leaves the trimethylamine HCl. — For analogous behavior of \bar{C} with Et₃N see (249).]

With aromatic ter-amines. [C with 3 wts. dimethylaniline at 100-115° for 8 hrs. gives (42% yield (250)) 4-trityldimethylaniline (4-dimethylamino-tetraphenylmethane), cryst. from alc., m.p. 204-205° (250), 208° (251).]

With heterocyclic ter-amines. [\bar{C} with pyridine does not give a simple quaternary salt; however, \bar{C} with pyridine in nitromethane + CHCl₃ (249) or in EtOAc (249), or \bar{C} in dry pyridine with exactly 1 mole H₂O (84) (252) (165), gives a definite prod., cryst. from acetone (249) or CHCl₃ (42), m.p. 176° (42), 174° (34) (253) (165), 172–174° (84), 170–175° (249); this prod. is formulated as either (C₆H₅)₃C.OH.C₅H₅N.HCl (249) or as (C₆H₅)₃CCl.-C₅H₅N.H₂O (84) (252) (42).]

BEHAVIOR OF C WITH ARYLHYDRAZINES

With monoarylhydrazines. \bar{C} with phenylhydrazine (2 moles) in dry ether at room temp. gives (90% yield (254)) N-trityl-N-phenylhydrazine [Beil. XV-581, XV₁-(184)], cryst. from boilg. abs. alc., m.p. 136-137° (254), 148° (255). [Note that this prod. is easily oxidized (dehydrogenated), e.g., with nitrous oxides (100% yield (254), 86% (256)) or Br₂/aq. (100% yield (257)) giving tritylazobenzene (C_6H_5)₃C—N=N— C_6H_5 [Beil. XVI-85], m.p. 113-114° (254), 110° (255), 110-112° (256) (for study of thermal decompn. of this prod see (258)).]

[C with p-nitrophenylhydrazine in a large vol. C_6H_6 gives (257) cf. (256) N-trityl-N-(p-nitrophenyl)hydrazine, m.p. 170° (250)]

With diarylhydrazines. [\bar{C} with N,N-(unsym.)-diphenylhydrazine (2 moles) in C_6H_6 refluxed 20 min. gives (259) N'-trityl-N,N-diphenylhydrazine, m.p. 136–137° (259). — \bar{C} with N,N'-diphenylhydrazine (hydrazobenzene) (2 moles) in dry ether under CO_2 refluxed 16 hrs. gives (259) N'-trityl-N,N-diphenylhydrazine, m.p. 107° (259) (in this connection recall also that \bar{C} with hydrazobenzene in boilg. C_6H_6 is in part reduced (79) to triphenylmethane).]

Behavior of C with Amides

[\bar{C} (2 moles) with urea (1 mole) in dry pyridine at 100° gives (165) cf. (179) N,N'-ditritylurea, cryst. from alc. with 2 EtOH not lost on air drying, m.p. 245° (165); note that N-tritylurea (prepd. indirectly (124)) has m.p. 234–235° dec (124). — \bar{C} (1 mole) + thiourea in pyridine at 100° for 1 hr. gives (165) cf. (179) N-tritylthiourea, cryst. from C_6H_6 , m.p. 222° dec. (165), 217° (179)]

BEHAVIOR OF C WITH HYDRAZIDES

[C with free semicarbazide (NH₂CONH.NH₂) in pyridine at 0° gives (88% yield (260)) 1-tritylsemicarbazide, cryst. from abs. alc. with 1 EtOH, m.p. 186-188° dec.; the solvate alc. is lost in vac. at 110° after 6 hrs. and m.p. rises to 190-192° (260).]

[C with primary hydrazides (acylhydrazine) in general reacts to give N-trityl-N-acylhydrazines which upon suitable dehydrogenation give N-trityl-N-acyl-azo compounds; the topic cannot here be expanded but for many examples see (260) (261).]

- ① Triphenylmethane (1:7220): Ifts. from alc. [From C in anhydrous formic acid (1:1005) at 100° for 2 hrs. in 90% yield (4).]
- Triphenylcarbinol (1:5985): cryst. from C₆H₆ or alc., m.p. 161-162°. [From C on boilg, with aq.]
- Trityl methyl ether: cryst. from MeOH, m.p. 82-83°. (See text above under behavior of C with alcohols.)
- Trityl ethyl ether: cryst. from EtOH, m.p. 83-84°. (See text above under behavior of C with alcohols.)

D N-Tritylphthalimide: tbls. from alc., m.p. 172° (179). [From C with K phthalimide at 200° (179).1

3:3415 3.4'-DICHLOROBENZOPHENONE C₁₃H₈OCl₂ Beil. S.N. 652 (m-Chlorophenyl p-chlorophenyl ketone)

M.P. 112.6-113.4° (1)

For prepn. of C from 1,1-dichloro-2-(m-chlorophenyl)-2-(p-chlorophenyl)ethylene (3:9863) by oxidn. with CrO_3 (41% yield) see (1).]

① 3.4'-Dichlorobenzophenone 2,4-dinitrophenylhydrazone: m.p. 258-260° (1).

3:3415 (1) Haller, Bartlett, Drake, Newman, Cristol, et al., J. Am. Chem. Soc. 67, 1601-1602 (1945).

3:3420 5,8-DICHLORONAPHTHOL-1

C₁₀H₆OCl₂

Beil. VI - 613 VI₁---VI₂---

M.P. 114-115° (1)

Cryst. (from CS₂) (1). — Spar. sol. hot aq. (1).

[For prepn. (in very poor yield) from γ -(2,5-dichlorophenyl)paraconic ac. [Beil. XVIII-422] by distn. see {1}.]

Č with FeCl₃ gives a white turbidity, changing on warming to flocculent violet ppt. (1). Č in alk. soln. coupled with diazotized naphthionic acid (1-naphthylaminesulfonic acid-4) gives dark violet color (1).

[For use in dyestuff industry see (2) (3) (4).]

 \oplus 5,8-Dichloro-1-naphthyl acetate: yellowish pr. from CS₂ + lgr., m.p. 144-145° (1).

3:3420 (1) Erdmann, Schwechten, Ann. 275, 285 (1893).
 (2) Aktien Ges. für Anilin Fabrikation, French 517,558, May 7, 1921; Cent. 1921, IV 194.
 (3) Soc. Chem. Ind. Basel, French 593,751, Aug. 31, 1925; Cent. 1926, I 1048.

3:3432 CHLOROMALEIC ACID CI—C—COOH $C_4H_3O_4Cl$ Beil. II - 752 Π_1 — Π_2 -(646)

M.P. 115° (1) (2) 114-115° (3) (4) [108° after sintering at 95° (5) (6)]

[See also chlorofumaric acid (3:4853).]

Cryst. from AcOH/CHCl₃, ether/CHCl₃, ether/pet. ether, or ether alone. — Eas. sol. alc., ether, AcOH; spar. sol. CHCl₃ or C₆H₆; insol. pet. ether.

[For prepn. of \bar{C} from $meso-\alpha,\alpha'$ -dichlorosuccinic acid (3:4930) with NaOAc/dil. AcOH on boilg. (5) (1), or from its neutral sodium salt in aq soln. on boilg. ½ hr. (4), see indic. refs.; from chloromaleic anhydride (3:0280) by hydrolysis with aq. and subsequent evapn. see (4) (5) (6) (7); from 3,5,5,5-tetrachloro-4-ketopenten-2-oic acid-1 (" β -(trichloroacetyl)- β -chloroacrylic acid") [Beil. III-733] on 24 hr. stdg. at room temp. of its soln. in excess 10% aq. Na₂CO₃ see (6); from chloromaleonitrile (b.p. 185° at 753 mm., 71.0-71.5° at 10 mm., $D_4^{20} = 1.2293$, $n_D^{20} = 1.48944$ (9)) by. hydrol. see (9).]

C on htg. at 180° loses H₂O yielding (6) chloromaleic anhydride (3:0280).

Č although unchanged by conc. HCl at ord. temp. for as long as 10 days (4) is by repeated evapn, with conc. HCl (7) isomerized to chlorofumaric acid (3:4853).

 \bar{C} in aq. soln. with Zn filings is dehalogenated yielding (4) fumaric acid (1:0895); \bar{C} (as Na₂ \bar{A}) in aq. soln. with 1% Na/Hg gives (4) mainly succinic acid (1:0530) accompanied by some fumaric acid (1:0895).

C readily reduces aq. KMnO₄.

[C readily combines with Br₂ if heated in s.t. to 100° (7).]

Č behaves normally as a dibasic acid: cg, titration with standard dil. aq. alk. gives Neut. Eq. 75.3; for study of electrometric titration see (1).

[Salts: KHĀ, eas. sol. aq. (dif. from corresp. salt of chlorofumaric acid (3:4853)), e.g., 100 g. of its satd. aq. soln. at 15° cont. 29.2 g. of KHA (7); for crystallographic data see (7).

332

— NaH \bar{A} .3H₂O, eas. sol. aq. (7). — Ag₂ \bar{A} , insol. aq. (7). — Ba \bar{A} .2H₂O (4) (5) (6), spar. sol. aq. — Ca \bar{A} .4H₂O (4). — Sr \bar{A} .4½H₂O, spar. sol. cold aq. (5). — Pb \bar{A} , insol. aq. (4).]

[\bar{C} on stdg. at ord. temp. with slight excess 0.76 N aq. KOH gives chlorine ion only $\frac{1}{2}$ as rapidly (4) as the isomeric chlorofumaric acid (3:4853).]

The acid chloride corresp. to \bar{C} , viz., chloromaleyl (di)chloride (3:6158) q.v., has been reported only by indirect means.

- Dimethyl chloromaleate: oil (see 3:9351).
- —— Diethyl chloromaleate: oil (see 3:6697).
- Chloromaleanii [N-phenyl-chloromaleimide]: ndls. from boilg. alc., m.p. 170° (8). [From aniline salt of C̄ (or of chlorofumaric acid) on htg. for a few minutes at 170–180° (8); note that this prod. on htg. with aniline yields (8) α-anilinosuccinanil [Beil. XXI-554, XXI₁-(432)], yel. cryst. from acetone + C₆H₆, m.p. 232° (8), and that a little of this latter cpd. which may accompany the former is readily removed from it by washing with warm C₆H₆ (8).]
- © Chloromaleic p-chloroanil [N-(p-chlorophenyl)chloromaleinimide]: pl. from hot alc., m.p. 175° (8). [From p-chloroaniline salt of \(\tilde{\C}\) on htg. for a few minutes at 170-180° (8).]
- © Chloromaleic p-bromoanil [N-(p-bromophenyl)chloromaleinimide]: microcrystn. powder from boilg. alc., m.p. 190° (8). [From p-bromoaniline salt of C on htg. for a few minutes at 170–180° (8).]

3:3445 2.7-DICHLORONAPHTHALENE

Cryst. from alc or C6H6; sublimes under reduced press. — Eas. sol. boilg. alc.

[For prepn. of \bar{C} from naphthalene-2,7-bis-(sulfonyl chloride) [Beil. XI-217] (4) (1), from 7-chloronaphthalene-2-sulfonyl chloride [Beil. XI-181] (4) (5), from 7-bromonaphthalene-2-sulfonyl chloride [Beil. XI-184] (7), from sodium 7-hydroxynaphthalenesulfonate-2 [Beil. XI-285, XI₁-(67)] (3) by htg. with PCl₅ as directed, see indic. refs.; from 7-sulfonaphthylamine-2 [Beil. XIV-763, XIV₁-(736)] by treatment of the corresp. diazonium chloride with PCl₅ in POCl₃ see (8); from 3,6-dichloronaphthalimide or 3,6-dichloronaphthalic acid (3:4870) with HgO + aq. in s.t. 6 hrs. at 200-210° see (10).]

 $\ddot{\mathbf{C}}$ on oxidn. with dil. HNO₃ (D=1.21) in s.t. at 140° yields (9) 4-chlorophthalic acid (3:4390), m.p. 157°.

[C on mononitration yields (9) a prod., m.p. 141.5-142°.]

[C on treatment with chlorosulfonic acid in CS₂, followed by conversion as directed (11), yields mixt. of two sulfonic acids; the major prod is 2,7-dichloronaphthalenesulfonic acid-3 (corresp. sulfonyl chloride, m.p. 166°, corresp. sulfonamide, m.p. 218° (12)), the minor prod. (10% of total) is 2,7-dichloronaphthalenesulfonic acid-4 (corresp. sulfonyl chloride, m.p. 152°) (11).]

CHAPTER IX

DIVISION A. SOLIDS

(3:3500-3:3999)

3:3500 6-CHLORONAPHTHOL-2

M.P. 115° (1) (2) (3) (4)

Ndls. from hot aq (1) (2); sol. alc., ether, AcOH, C₆H₆, CHCl₃, CS₂. — Sublimes in prisms. — \bar{C} depresses m.p. of 8-chloronaphthol-2 (3:2965), m.p. 101° to 79-88° (2).

[For prepn. of \bar{C} from 1,6-dichloronaphthol-2 (3:3600) with FeSO₄ + NaOH see (4); from 6-chloronaphthol-2-sulfonic acid-4 (2) (3) with Na/Hg in dil. HCl see (2) (3); from K salt of 2-naphtholsulfonic acid-6 [Beil. XI-282, XI₁-(66)] with 3 moles PCl₅ at 165° as directed see (1) (2)]

 $[\bar{C}$ (as dry sodium salt) with CO₂ under press and at elevated temp. yields (5) 6-chloro-2-hydroxynaphthoic acid-3, yel. lfts. from AcOH, m.p. 260° (5).]

 \bar{C} on oxidn, with dil HNO₃ ($D=1\,13$) in s.t. at 190–200° gives (6) 4-chlorophthalic acid (3:4390).

- © 6-Chloro-2-naphthyl benzoate: mp. 124-125° (3).
- **©** 6-Chloro-2-naphthyl m-nitrobenzoate: ndls. from much alc., m.p. 146-147° (2). [From \tilde{C} dislyd in 10% NaOH at 50-60° and shaken with m-nitrobenzoyl chloride (2).]

3:3500 (1) Claus, Zimmermann, Bcr 14, 1483-1485 (1881). (2) Ruggli, Knapp, Merz, Zimmermann, Helv. Chim. Acta 12, 1048-1050 (1929). (3) Battegay, Silbermann, Kienzle, Bull. soc. chim. (6) Claus, Dehne, Bcr 15, 321 (1882).

3:3505 4-CHLORO-3,5- OH C_8H_9OCl Beil. VI — VI₁— VI₂—(463)

Cryst. from benzene.

[For prepn of \tilde{C} from 3,5-dimethylphenol (m-5-xylenol = sym.-m-xylenol) (1:1455) with SO_2Cl_2 (1 mole) in CHCl₃ (1) or with Cl_2 in AcOH (66% yield (2)) or from crude coaltar fraction consisting mainly of 3,5-dimethylphenol with Cl_2 or SO_2Cl_2 (5) see indic. refs. (note that some 2-chloro-3,5-dimethylphenol (6-chloro-m-5-xylenol) (3:0844) is formed as a by-product (1) (5); also that 3,5-dimethylphenol in AcOH on complete saturation

with Cl₂ gives (2) 2,4,4,6-tetrachloro-3,5-dimethylcyclohexadien-2,5-one-1, m.p. 106-107°

(2)).]

C and its derivatives have attracted much attention as antiseptics, disinfectants, preservatives, bactericides, fungicides, etc. [e.g., for studies from various aspects of bactericidal properties of C see (4) (6) (7) (8) (9) (10) (11) (12) (13) (14) (15) (16); for studies on use as fungicide in leather (17) (18) including toxicity (19) see indic. refs.].

[For patents on use of C for improving wettability of materials (20), or for use with soaps, etc., as disinfectant (21), as component of mixtures for insecticides (22) see indic. refs.

[For study of fate of C in animal and human metabolism see (23).]

[For study of tests for detection of \bar{C} see (24); for studies of quant. detn. of \bar{C} (3) (25) in urine, blood, or tissue (26) see indic. refs.]

CHEMICAL BEHAVIOR OF C

NUCLEAR SUBSTITUTION

Halogenation. [C̄ with Cl₂ (1 mole) (used in form of N-chloroacetamide (27)) gives 2,4-dichloro-3,5-dimethylphenol (2,4-dichloro-m-5-xylenol) (3:2182), m.p. 83°; C̄ with Cl₂ (2 moles) should give 2,4,6-trichloro-3,5-dimethylphenol (trichloro-m-5-xylenol) (3:4713), m.p. 177°, although such prepr. of the latter is not actually reported; for action of excess Cl₂ in AcOH see note above under prepr. of C̄.]

C with Br₂ (2 moles) in AcOH gives (1) 2,6-dibromo-4-chloro-3,5-dimethylphenol, ndls., m.p. 158° (1).

Nitration. \bar{C} on mononitration with conc. HNO₃ in AcOH gives (28) (2) 4-chloro-2-nitro-3,5-dimethylphenol, m.p. 90° (28), 87-89° (2) (corresp. methyl ether, m.p. 166°; corresp. ethyl ether, m.p. 107° (28)). — Note that the dinitro deriv. of \bar{C} , viz., 4-chloro-2,6-dinitro-3,5-dimethylphenol, appears to be unreported.

Mercuration. [For study of mercuration of C see (29); for patents see (30).]

Alkylation. \bar{C} with alcs. in pres. of ZnCl₂ at 80° undergoes nuclear alkylation (perhaps by rearr. of intermediate ethers). [E.g., \bar{C} with isopropyl alc. (1:6135) gives (9) (32) 4-chloro-3,5-dimethyl-2-isopropylphenol, b.p. 125° at 3 mm., \bar{C} with diethylcarbinol (1:6175) gives (9) (32) 4-chloro-3,5-dimethyl-2-(diethylmethyl)phenol, b.p. 141–142° at 3 mm.; etc. — \bar{C} (as Na \bar{A}) with benzyl chloride (3:8535) in toluene gives (33) 4-chloro-3,5-dimethyl-2-benzylphenol (5-chloro-4,6-dimethyl-2-hydroxydiphenylmethane), m.p. 68.7°, b.p. 182–185° at 4 mm., etc.]

Other nuclear substitutions. [For behavior of \bar{C} with o-nitrophenylsulfenyl chloride see (34) (35) (36).]

[$\tilde{\mathbf{C}}$ with hexamethylenetetramine htd. with glycerol + boric acid, then hydrolyzed with conc. H₂SO₄, all as directed (38), gives (27% yield) 4-chloro-3,5-dimethyl-2-aldehydophenol (5-chloro-4,6-dimethylsalicylaldehyde), m.p. 96° (corresp. oxime, m.p. 197°); note that $\tilde{\mathbf{C}}$ with CHCl₃ + aq. NaOH (Reimer-Tiemann process) gives only 10% yield and prod. is dif. separable (38).]

OTHER REACTIONS OF C

[Č (1 mole) with ethyl acetoacetate (1 mole) + conc. H₂SO₄ gives (35% yield (37)) 6-chloro-2,5,7-trimethylchromone, m.p. 145-146° cor.; note that the isomeric 6-chloro-4,5,7-trimethylcoumarin, m.p. 194-195.5° cor., which might be expected in the above condensation has been obtd. indirectly (37).]

^{—— 4-}Chloro-3,5-dimethylphenol methyl ether: m.p. 22.5-23.5°, b.p. 117° at 14 mm. (2).

- ---- 4-Chloro-3,5-dimethylphenol ethyl ether: unreported.
- ① 4-Chloro-3,5-dimethylphenol benzyl ether: m.p. 57° (28). [Note that nitration of this ether gives 4-chloro-2-nitro-3,5-dimethylphenol benzyl ether, m.p. 105° (28).]
- 4-Chloro-\$\overline{3}\$,5-dimethylphenyl acetate: m.p. 48.7° (9), 48° cor. (37), b.p. 102° at 2.5 mm. (9). [From \$\overline{C}\$ + Ac₂O + trace H₂SO₄ (93% yield (37)); for study of Fries rearr. of this ester with AlCl₃ to 4-chloro-3,5-dimethyl-2-acetylphenol methyl ether see (37).]
- ---- 4-Chloro-3,5-dimethylphenyl benzoate: unreported.
- 3:3505 (1) Lesser, Gad, Ber. 56, 974, 976 (1923). (2) von Auwers, Mürbe, Saurwein, Fortschr. Chem. Physik. u. physik. Chem. 18, No. 2, 1-45 (1924); Cent. 1924, II 2267; C.A. 19, 2339 (1925). [Note that, in addition to its ordinary use to designate \bar{C} specifically, the term "chloralide" is also used generically to denote a class of compounds formed by condensation of chloral (3:5210) with α -hydroxy acids]

Cryst. from alc. or ether; eas. sublimable; insol. aq; eas. sol. hot but spar. sol. cold alc.; eas. sol. ether; eas. sol. in 80% AcOH (dif. and sepn. from metachloral (1)). — For crystallographic studies see (10).

Note that m.p. of \bar{C} is almost identical with that of α -parachloral, m.p. 116°, but that mixed m.p. of the two is depressed as low as 85–90° (2); β -parachloral, however, has m.p. 152° (2).

[For prepn. of $\bar{\mathbb{C}}$ from chloral (3:5210) or chloral hydrate (3:1270) with cone. or fumg. H_2SO_4 (yields: 61% (11), 44–51% (4) both based on chloral hydrate) see (11) (4) (8) (12) (6); for form. of $\bar{\mathbb{C}}$ from chloral hydrate with H_2SO_4 as a by-product (abt. 2% (2)) in prepn. of α - and β -parachloral + metachloral, or from chloral by warming with AlCl₃ (1), see indic refs.; for formn. of $\bar{\mathbb{C}}$ from chloral with ClsO₃II as by-prod. of prepn. of octachlorodiethyl ether (3:0738) see (3); for formn. of $\bar{\mathbb{C}}$ from chloral (excess) with β,β,β -trichloro- α -hydroxypropionic acid (trichlorolactic acid) [Beil. III-286, III₁-(111), III₂-(210)] in s.t. at 150–160° see (4) (13) of (17).]

[$\bar{\mathbf{C}}$ on reduction with Zn + HCl in alc. soln. gives according to conditions very small amts. of β,β -dichloroacrylic acid (3:1875) (14) (15) (16), β -chloroacrylic acid (3:2240) (11), and acetaldehyde (1.0100) (15) (16).] — [$\bar{\mathbf{C}}$ is unaffected by boilg HNO₃ (8).]

[$\ddot{\mathbf{C}}$ with PCl₅ in s t. at 270–290° for several days gives (18) (9) 5-chloro-2,5-bis-(trichloromethyl)dioxolane-1,3-one-4 ("trichlorolactic acid-tetrachloroethylidene ether-ester") [Beil. XIX-105], oil, b p. 276° (18), $D_4^{20}=1.7426$ (18).]

Č with boilg. alkalies undergoes hydrolytic cleavage yielding (4) (12) (6) (7) chloroform (3:5050) and salts of formic acid (1:1005).

[\bar{C} with abs. EtOH in s.t. at 140–150° gives (16) (4) chloral ethylalcoholate (3:0860) and ethyl β,β,β -trichlorolactate [Beil. III-287, III₁-(111), III₂-(210)], m.p. 66–67°.]

3:3520 2,4,6-TRICHLORO-3-HYDROXYBENZALDEHYDE

M.P. 115.5-116.5° (1) 115-116° (6) 114° (2) 113° (3)

Colorless cryst. from 50% AcOH; \bar{C} seps. with AcOH of crystn. but this immediately effervesces in air. — \bar{C} has pronounced sternutatory props. and on moist skin produces painful blisters (2).

[For prepn. of \bar{C} from *m*-hydroxybenzaldehyde (1:0055) in AcOH with excess Cl_2 see (1) (2).]

[For condens. of \bar{C} with 2,4-dichlorophenol (3:0560) see (4); with 2,4-dihydroxybenzoic acid (1:0843) and use of prod as dye intermediate see (5).]

 \bar{C} in 50% aq. KOH warmed for 4 hrs at 60-70° gives (89.9% yield (3)) 2,4,6-trichlorophenol (3:1673).

NaA, pure yel. ndls., spar. sol. aq (2).

C in Na₂CO₃ soln. with Me₂SO₄ yields 2,4,6-trichloro-3-methoxybenzaldehyde, ndls. from alc, mp. 76° (2); on very slow oxidn. with alk. KMnO₄ this prod. yields 2,4,6-trichloro-3-methoxybenzoic acid, mp. 109° (2).

- 2,4,6-Trichloro-3-hydroxybenzaldoxime: ndls. from dil. alc., m.p. 174° (2), 170° (6).

 [This with boilg Ac₂O yields 2,4,6-trichloro-3-acctoxybenzonitrile, lfts. from dil. AcOH, m.p. 82-83° (6)]
- ① 2,4,6-Trichloro-3-hydroxybenzaldehyde p-nitrophenylhydrazone: yel.-or. ndls., m.p. 272-273° dec. (2) [From \bar{C} in alc. with p-nitrophenylhydrazine + 1 drop aq. (2).]

3:3520 (1) Bissell, Kranz (to Nat Aniline & Chem. Co.), U.S. 1,776,803, Sept. 30, 1930; Cent. 1931, I 150, C A 24, 5769 (1930). (2) Hodgson, Beard, J. Chem. Soc 1926, 148-149, 153. Bayer & Co.), U.S. 1,532,790, April 7, 1925; Cent. 1925, II 352. (6) Krause, Ber. 32, 123 (1899).

3:3523 2,3,4,5-TETRACHLOROPHENOL

M.P. 116-117° (1) 116° (2) (3)

[For prepn. of \bar{C} from 2,3,4,5-tetrachloroaniline [Beil. XII-630, XII₁-(313)] via diazotization and reaction with aq. (65% yield) see (1); from 2-amino-3,4,5,6-tetrachlorophenol [Beil. XIII-386] (3) via diazotization and elimination of diazo group with alc. see (3); for formn of \bar{C} from pentachlorobenzene (3:2290) with N/2 MeOH/NaOMe at 180° in s.t. for 7½ hrs. as by-prod. of the isomeric 2,3,5,6-tetrachlorophenol (3:3460) see (4).]

 \bar{C} in aq. behaves as an acid, K at $25^\circ = 1.1 \times 10^{-7}$, and can be titrated with N/10 aq. NaOH (1), Neut. Eq. = 232.

- 2,3,4,5-Tetrachlorophenol ethyl ether (2,3,4,5-tetrachlorophenetole): unreported.
 2,3,4,5-Tetrachlorophenyl acteate: unreported.
- © 2,3,4,5-Tetrachlorophenyl benzoate: m.p 110° (4) (5). [Note that this prod. depresses m.p. of corresp. benzoate from the isomeric 2,3,4,6-tetrachlorophenol (3:1687) (5).]
- 2.3.4.5-Tetrachlorophenyl N-phenylcarbamate: unreported.

3:3523 (1) Tiessens, Rec. trav. chim. 50, 115-116, 119 (1931). (2) Tiessens, Rec. trav. chim. 48, 1068 (1929). (3) Bures, Havlinova, Časopis Českoslov. (5) Holleman, Rec. trav. chim. 40, 318-319 (1921).

D1 151011

3:3525 4,5-DICHLOROCATECHOL (4,5-Dichloropyrocatechol)

Colorless pr. from CHCl₃ + CS₂ (1); ndls. from C_6H_6 + pet. ether (2). — \bar{C} is eas. sol. in cold aq. from which it crystallizes as a hemihydrate (1) (it is possible that the m.p. of $105-106^\circ$ observed by some workers may have been due to formn. of this prod.). — \bar{C} cryst. from AcOH with 1 mole of solvent, viz., \bar{C} .AcOH (1).

[For prepn. of \bar{C} from pyrocatechol (1:1520) with SO₂Cl₂ (2 moles) or from 4-chloropyrocatechol (3:2470) with SO₂Cl₂ (1 mole) see (2)

[C with silver oxide in dry ether gives (1) 4,5-dichlorobenzoquinone-1,2 [Beil. VII₁-(338)], m.p. 94°; note, however, that C with this prod. forms a corresp. quinhydrone, dec. abt. 85°.]

[C with Cl₂ in AcOH gives (1) 3,4,5-trichloropyrocatechol (3:3448) cryst. from aq. as monohydrate, m.p. abt. 106-109° (1), 104-105° (4), 115° (5).

[C with PCl₅ gives (2) 1,2,4,5-tetrachlorobenzene (3:4115).]

 \bar{C} with N/10 aq. KOH titrates (1) as a monobasic acid, i.e., Neut. Eq. = 89.5. — \bar{C} with aq. FeCl₃ gives blue-green coloration becoming red on addn. of aq. Na₂CO₃ (1).

C does not (6) condense with xanthydrol (1:5205) in AcOH (dif. from 4-chloropyrocatechol (3:2470)).

- ---- 4,5-Dichloropyrocatechol diacetate: unreported.
- 1. 4.5-Dichloropyrocatechol dibenzoate [Beil. IX₁-(72)]: m.p. 140.0-140.5° (1).

3:3525 (1) Willstatter, Müller, Ber. 44, 2184-2186 (1911). (2) Peratoner, Gazz. chim. ital. 28, I 222-224 (1898). (3) Frejka, Sefranek, Zika, Collection Czechslov. Chem. Commun. 9, 243-244 (1937). 3:3530 5-CHLORORESORCINOL

M.P. 117° (1)

 \bar{C} cryst. from C_6H_6 in colorless ndls. of monohydrate, m.p. 67° (1), which on sublimation in vac. yield anhydrous \bar{C} (1).

Č is readily sol. in all usual solvents except lt. pet.; it rapidly absorbs aq. regenerating above monohydrate, m.p. 67° (1).

Č with FeCl₃ gives bluish-purple color; Č reduces boilg. Fehling soln.

Č on bromination (no details (1)) yields 5-chloro-2,4-tribromoresorcinol, colorless ndls. from AcOH or dil. alc., m.p. 143° (1).

3:3530 (1) Hodgson, Wignall, J. Chem. Soc. 1926, 2827.

Colorless cryst. from alc. or pet. ether. — Insol. aq; sol. alc. or lt. pet.; freely sol. ether, acetone, benzene, or CHCl₃. — [For use of \bar{C} in stimulation of action of estrogenic hormones see (7); for aq. susp. of \bar{C} for medicinal use see (9).]

[For prepn. of C from 1,1,2-triphenylethanol-1 (benzyl-diphenyl-carbinol) [Beil. VI-721, VI₁-(354)] in AcOH by treatment with Cl₂ at 30-40°, then htg. to b.p. to remove AcOH and effect loss of HCl (87% yield), see (1); from 1,2-dichloro-1,1,2-triphenylethane (1) by htg. just above m.p. (115°) (100% yield (1)) or by refluxing 5 hrs. in pyridine (65% yield (1)) see (1); from triphenylethylene [Beil V-722, V₁-(355)] in AcOH with Cl₂ (1), in C₆H₆ with PCl₅ (4), or in CCl₄ with SO₂Cl₂ in pres. of dibenzoyl peroxide (2) see indic. refs.; from ω,ω-diphenylacetophenone (1,1,2-triphenylethanone) (triphenylvinyl alcohol) [Beil. VII-522, VII₁-(291)] (5) (3) or from triphenylacetaldehyde [Beil. VII₁-(292)] (6) with PCl₅ see indic. refs.]

3:3580 2-CHLORONAPHTHO-QUINONE-1,4 (2-Chloro-α-naphthoquinone)

C₁₀H₅O₂Cl Beil. VII - 729 VII₁—

Yel. ndls. with pungent quinone odor from dil. alc. or dil. AcOH. — Volatile with steam. — Eas. sol. alc., C₆H₆; spar. sol. ether.

[For prepn. of \tilde{C} from naphthoquinone-1,4 (α -naphthoquinone) (1:9040) by conversion with Cl₂ in AcOH to 2,3-dichloro-1,4-diketo-1,2,3,4-tetrahydronaphthalene (" α -naphtho-

quinone dichloride") [Beil. VII-702] and subsequent elimination of 1 HCl with NaOAc/AcOH see (4) cf. (7); from α -naphthol (1:1500) by conversion with Cl₂ in AcOH to 2,2,4-trichloro-1-keto-1,2-dhydronaphthalene [Beil. VII-387] and subsequent hydrolysis (with rearr.?) in boilg. dil. alc. or dil. AcOH see (5).

[For prepn. of \bar{C} from 1,3-dichloronaphthalene (3:1310) by oxidn. with $CrO_3/AcOH$ see (8); from 2,4-dichloronaphthol-1 (3:3250) by oxidn. with $CrO_3/AcOH$ or $HNO_3/AcOH$ see (5) (9); from 2-chloro-1,2-diaminonaphthalene (2-chloronaphthylenediamine-1,2) by oxidn. with 2% alk $KMnO_4$ see (2); from 2-chloronaphthol-1-sulfonic acid-4 by oxidn. with MnO_2 in boilg. 50% H_2SO_4 see (1); from 2,4-dimitronaphthol [Beil. VI-617, VI₁-(308)] by oxidn. with NaOCl in HCl soln (3) or $HCl + KClO_3$ (10) see indic. refs; from sodium salt of 4-(p-sulfobenzeneazo)naphthol-1 ("Orange I") [Beil. XVI-275, XVI_1 -(296)] by oxidn. with NaOCl in HCl soln see (3)]

[$\bar{\mathbf{C}}$ on reduction might be expected to give 2-chloro-1,4-dihydroxynaphthalene [Beil. VI-975], m.p. 116-117°; note, however, that this reaction has not actually been reported and that this prod. is also obtained by SO₂ reduction of 3-chloronaphthoquinone-1,2 (3:4704). — For study of oxidn.-reductn. potential of $\bar{\mathbf{C}}$ see {7}.]

[C with Cl2 in AcOH gives (4) (5) 2,3-dichloronaphthoqumone-1,4 (3:4857).]

[C in boilg. alc. with aq. NaN₃ splits out NaCl giving (90% yield (11)) 2-azidonaphtho-quinone-1,4, long yel. pr. from alc, mp. 118° dec]

Č with aniline on htg. (5) (6) in alc. soln. (8) (9) gives 3-chloro-2-anilino-naphthoquinone-1,4 [Beil. XIV-168, XIV₁-(434)], red ndls, m.p. 207-208° (10), 207° (8), 202-203° (9) (6).

 \bar{C} like many other quinones is able to form Diels-Alder type adducts with many conjugated dienes [e.g., \bar{C} with 2,3-dimethylbutadiene-1,3 (1:8050) gives an adduct which with aq. 5% NaOH and a little Na₂S₂O₄ at 70° reduces (with loss of halogen) to 2,3-dimethyl-1,4-dihydroanthrahydroquinone which in turn upon oxidn. with air at 0° gives (12) 2,3-dimethylanthraquinone [Beil. VII-815, VII₁-(425)], yel. ndls from alc or AcOH, m.p. 210° (13), 209° (14), 208-209° (15), 208° (16), 205-206° (17); note also that this 2,3-dimethylanthraquinone is also obtd. (18) from the initial adduct with pyridine in absence of air, or (18) from \bar{C} + 2,3-dimethylbutadiene-1,3 (1:8050) at 100-105° under press. — For behavior of \bar{C} with 2-methylbutadiene-1,3 (isoprene) (1:8020) and with butadiene-1,3 see (18).]

- 2-Chloronaphthoquinone-1,4-(p-nitrophenylhydrazone-4) = 4-(p-nitrobenzeneazo)-2-chloronaphthol-1: m.p. 274° dec. (1). [From $\bar{\mathbb{C}}$ with p-nitrophenylhydrazine (1); also from 2-chloronaphthol-1 (3:1490) in alk. soln. on coupling with diazotized p-nitroaniline (1).]

3:3585 α-CHLORO-DIPHENYL-ACETIC ACID

(Diphenylchloroacetic acid)

M.P. 120° dec. (1) 118-119° dec. (2) (3)

[See also \alpha-chlorodiphenylacetyl chloride (3:0885).]

Tbls. from C₆H₆/lgr.; very eas. sol lgr.

[For prepn of \bar{C} from benzilic acid (α -hydroxydiphenylacetic acid) (1:0770) with POCl₃ on warming (not boilg.) until red color begins to appear (65% yield (3)) (4); with PCl₅ (62.5% yield (1)) or PCl₃ (68% yield (1)) both at room temp.; with SOCl₂ directly at room temp. (92% yield (1)) or with SOCl₂ (3 moles) in CCl₄ at ord. temp. (5) (2) see indic. refs.; note, however, that benzilic acid (1:0770) with PCl₅ (2 moles) at 120–130° (6) or 100° (7) or excess PCl₅ (5 moles) in C₆H₆ at room temp. (1) gives instead α -chlorodiphenylacetylehloride (3:0885), m p 50°; note also that benzilic acid (1:0770) with large excess (6 moles) SOCl₂ refluxed for several days gives (5) α -chlorodiphenylacetic acid anhydride [Beil. IX₁-(228)], m.p. 129° (5)].

[For prepn. of \bar{C} from O-carbomethoxybenzilic acid (2) with SOCl₂ see (2); for prepn. of \bar{C} from α -chlorodiphenylacetyl chloride (3:0885) by hydrolysis (even in moist air) see (8)]

Č on reduction with T₁Cl₃ in boilg. AcOH gives (8) diphenylacetic acid (1:0765), m.p. 148°.

Č (or its sodium salt) htd. under reduced press. at 125° for 10 hrs gives (80-90% yield (9)) benzilide [Beil. XIX-187, XIX₁-(700)], ndls. from alc., m p 196° (10), 194° (11) (5), 193° (12), 192-193.5° (9) [the structure of this prod. is disputed, but it is either 2,2,5,5-tetraphenyl-3,6-diketodioxane-1,4 or tetraphenyldiglycolic acid anhydride].

 \bar{C} with aq. KSH (or NaSH) does not (21) give the expected α -mercaptodiphenylacetic acid (diphenylthioglycolic acid) (thiobenzilic acid) [Beil. X_{1} -(154)], but rather (apparently because of alkalinity of the soln.) benzilic acid (1:0770).

[\bar{C} with NaOMe (?) gives (13) α -methoxydiphenylacetic acid (benzilic acid O-methyl ether) [Beil. X₁-(152)], m.p. 100° (13); note that various compounds prepd. by a wide variety of methods but all supposed to have this structure have been reported with m.p.'s as follows: 99-100° (14), 102° (15), 106° (16), 107° (17), 111-112° (18), 120-121° (9); note also that the corresp. methyl ester, viz., methyl α -methoxydiphenylacetate, oil, b.p. 199-200° at 27 mm., has been prepd. (19) from α -bromodiphenylacetyl bromide with MeOH.]

[C with EtOH/NaOEt gives (8) cf. (13) α -ethoxydiphenylacetic acid [Beil X₁-(152)], tbls. from ether, m.p. 114-115° (20) (8), 114° (13), 113-114° (14); the corresp. ethyl ester, viz., ethyl α -ethoxydiphenylacetate, appears to be unreported]

 \tilde{C} with Na phenolate might be expected to give α -phenoxydiphenylacetic acid, but neither this reaction nor the expected prod. is reported. — However, \tilde{C} with thiophenol in C_6H_6 refluxed 2 hrs. evolves HCl and gives (22) α -thiophenoxy-diphenylacetic acid, cryst. from 50% AcOH, m.p. 126-128° (22).

[\bar{C} with C_6H_6 + AlCl₃ gives normal Friedel-Crafts type reaction giving (25% yield (3)) triphenylacetic acid [Beil. IX-712, IX₁-(309)], m.p. 265°.]

 \tilde{C} with various amines or amino compds. splits out HCl giving the corresp. α -aminodiphenylacetic acid derivatives [e.g., \tilde{C} with NH₃ gives (13) α -aminodiphenylacetic acid (diphenylglycine), m.p. 245° (13); \tilde{C} with piperidine gives (13) α -piperidinodiphenylacetic acid, m.p. 180° (13); for other cases see (13)].

C with benzhydrazide in C₆H₆ splits out HCl and yields (8) α-benzhydrazido-diphenylacetic acid, m.p. 167-168° (8).

 \bar{C} with excess SOCl₂ on warming does not give the expected α -chlorodiphenylacetyl chloride (3:0885), m.p. 50°, but rather (5) α-chlorodiphenylacetic acid anhydride, m.p. 129° (5).

C in pyridine on htg. at 100° (23) evolves CO2 presumably yielding benzohydryl chloride (a-chlorodiphenylmethane) (3:0060) as its quaternary salt with pyridine.

- Methyl α -chlorodiphenylacetate: oil, b.p. 196° at 16 mm. (4). [From \bar{C} in dioxane soln. with diazomethane (100% yield) (4); note also that this ester with Cu bronze refluxed in C₆H₆ for 5 hrs. then evaporated in air gives (4) the peroxide, m.p. 151-152°, of dimethyl tetraphenylsuccinate.]
- Ethyl α -chlorodiphenylacetate: cryst. from alc., m.p. 43-44° (24) (6), b.p. 185° at 14 mm. (24). [From C with EtOH + dry HCl (10) best in pres. of C₆H₆ as directed (90% yield (25)), or from α-chlorodiphenylacetyl chloride (3:0885) with EtOH (6), or from ethyl benzilate (1:2086) with PCl₅ (6)]
- α -Chlorodiphenylacetamide: m.p. 115° (6), 111–113° (26). [From α -chlorodiphenylacetyl chloride (3:0885) in ether with NH₃ gas (6) (13).]
- α -Chlorodiphenylacetanilide: m.p. 88°. [See text of α -chlorodiphenylacetyl chloride (3:0885).]

3:3590 PENTACHLOROBENZAL (DI)CHLORIDE

C7HCl7 Beil. V - 304 V_{1} -(153)

Colorless lfts. from alc.; eas. sol. hot, spar. sol. cold, alc.

[For prepn. of C from 2,3,4,5,6-pentachlorotoluene (3:4937) with Cl₂ at 210-230° as directed (70-80% yield) see (3); for formn. of C from benzal (d1)chloride (3:6327) with Cl₂ in pres. of I₂ + SbCl₅ see (2); from "pentachloro-orcinol" [Beil. VII-576, VII₁-(323)] with PCl₅ (2 moles) at 230° for 12-16 hrs. (together with hexachlorobenzene (3:4939)) see (1).]

C is unaffected by aq. even in s.t. at 300°; however, C on hydrolysis with conc. HoSO4

at $60-100^{\circ}$ or with fumg. H_2SO_4 at $40-50^{\circ}$ gives (90% yield (3)) (4) pentachlorobenzaldehyde (3:4892), m.p. 202.5° (3).

3:3600 1,6-DICHLORONAPHTHOL-2 Cl
$$C_{10}H_6OCl_2$$
 Beil. VI — VI₁— VI₂-(604)

M.P. 119.5° (1)

Ndls, from hot lgr.

[For prepn. from 1-chloronaphthol-2 (3:1700) by actn. of Cl₂ in sunlight see (1).] C on reduction with FeSO₄ + NaOH yields (2) 6-chloronaphthol-2 (3:3500), m.p. 115° (2).

3:3600 (1) Ruggli, Knapp, Merz, Zimmermann, Helv. Chim. Acta 12, 1050-1051 (1929). (2) Herzberg, Spengler, Schmidt (to I.G.), Ger. 431,165, June 30, 1926; Cent. 1926, II 1196.

M.P. 119-120° (1) 118.5-119° (2) 118-119° (3) 116° (4)

[See also dichloromalesc anhydride (3:3635) and dichloromaleyl (di)chloride (3:6197).]

Ndls. from lgr./ether. — Eas. sol. aq.; sol. alc., Λ cOH; insol. C_6H_6 , $CHCl_3$, CS_2 . — Note that \bar{C} on htg. very readily loses H_2O and is converted to dichloromaleic anhydride (3:3635); the m.p.'s observed for \bar{C} are probably actually those of its anhydride.

Note also that, although the structure corresp. to Č should be capable of existing also in the geometrically isomeric *trans* configuration, no such dichlorofumatic acid or its derivatives has ever been reported.

[For prepn. of \bar{C} from furfural (1:0185) in conc. HCl soln. with Cl₂ (30% yield) see (5); from dichloromaleinaldehyde-acid ("mucochloric acid") [Beil. III-727] by oxidn. with fumg. HNO₃ on stdg. at ord. temp. for several days (100% yield (4)) (2) see indic. refs.; from α,β -dichloro- β -(trichloroacetyl)acrylic acid ("perchloro- β -acetylacrylic acid") [Beil. III-733] by hydrolytic cleavage with aq. NaOH (chloroform is also formed) see (3); from hexachlorocyclohexen-1-dione-3,6 [Beil. VII-574] by hydrolytic cleavage with 10% aq. NaOH (trichloroethylene (3:5170) is also formed) see (1); from hexachlorocyclohexen-1-dione-3,5 ("hexachlororesorcinol") (3:3470) (6) or from 2,2,3,4,6,6-hepta-chlorohexen-3-one-5-acid-1 [Beil. III-735, III₁-(255)] (6) with large excess dil. aq. Ca(OCl)₂ see indic. refs.]

[For formn. of \bar{C} from 3,4-dichlorofuroic acid [Beil. XVIII-282] by oxidn. with boilg dil. HNO₃ (7) or from 3,4,5-trichlorofuroic acid [Beil. XVIII-283] by oxidn. with hot dil. HNO₃ or cold Br₂/aq. (7) see indic. refs.; from pyrrole with aq. NaOCl (other prods. are also formed) see (8).]

 $\bar{\mathbf{C}}$ behaves normally as a dibasic acid: e.g., $\bar{\mathbf{C}}$ on titration with standard dil. aq. alk. gives Neut. Eq. 92 5 (2).

[Salts: for Li₂ \bar{A} , Na₂ \bar{A} .H₂O, NaH \bar{A} .H₂O, K₂ \bar{A} .2H₂O, K₂ \bar{A} .H₂O, Cu \bar{A} .H₂O, Pb \bar{A} .H₂O, Ni \bar{A} .2H₂O see (4). — Ba \bar{A} .2½H₂O (3). — Ag₂ \bar{A} , white ndls. which explode on htg. (3) (8) (9).]

- Dimethyl dichloromaleate: oil, b.p. 225° (9). [From dichloromaleic anhydride (3:3635) in MeOH with HCl gas on boilg. (9). This prod. with aniline at 100° yields (4) dimethyl α,β -dianilinomaleate, cryst. from alc., m.p. 172° (4).]
- Diethyl dichloromaleate: unreported.
- Dichloromaleinimide [Beil XXI-401] ndls. from aq., m.p. 179° (10). [From dichloromaleic anhydride (3:3635) with urea on htg. at 110-115° (10)]
- --- N-Phenyldichloromaleinimide (dichloromaleanil) [Beil. XXI-402]: colorless lfts. from MeOH. m.p. 203°. [Reported only by indirect means.]
- Dichloromaleic dianilide: see under text of dichloromaleyl (di)chloride (3:6197).
- **3:3634** (1) Zincke, Fuchs, Ann. 267, 19-22 (1892). (2) Stelling, Z physik Chem. B-24, 424 (1934). (2) 31, 5-6 (1885). (10) Dunlap, Am. Chem. J. 18, 333-334 (1896).

M.P. 119-120° (1) (2) 119.5° (3) 119° (4) (8)

119' (4) (8) 117-118° (5)

[See also dichloromaleic acid (3:3634).]

Colorless lfts. very eas. sol. alc., ether, C6H6, or CS2; sublimable.

[For prepn. of \bar{C} from dichloromaleic acid (3:3634) by htg. see (1) (2) (10); for prepn. of \bar{C} from maleic anhydride (1:0625) with Cl_2 at 130° in pres. of Fe (80% yield (7)) or from chlorofumaryl dichloride with Cl_2 in pres. of Fe (8) see indic. refs.; for prepn. of \bar{C} from furoic acid (1:0475) by conv with $MnO_2 + HCl$ to mucochloric acid, OCH.CCl= CCI.COOH [Beil. III-727] (9), and subsequent treatment with fung. HNO_3 (4) (9) or from 3,4-dichlorofuran (9) by oxidin with fung. HNO_3 (9) see indic. refs; for formin. \bar{C} (together with other products) from diethyl tartrate (1:4256) with PCl_5 for 7-8 hrs. at 100° see (6); from either dichloromaleo(di)nitrile (m.p. 58-59°, $D_4^{62} = 1.32501$, $n_D^{62} = 1.48824$ (12)) or from dichlorofumaro(di)nitrile (m.p. 60.0-60.5°, $D_4^{62} = 1.32543$, $n_D^{62} = 1.48845$ (12)) by hydrol. see (12).]

 \tilde{C} is itself spar. sol. aq. but slowly dissolves (1) (6) yielding a soln. of dichloromaleic acid (3:3634).

C with PCl₅ yields (8) dichloromaleyl dichloride (3:6197).

 \bar{C} with 1 mole anthracene (1:7285) htd. for 10 min. at 170° gives 100% yield (4) of anthracene-9,10-endo-dichloromaleic anhydride, ndls. from acetonitrile, m.p. 235° (4).

Č with 1 mole urea htd. to 90-95° for 20 min. yields (11) dichloromaleic acid monoureide [Beil. III-68], m.p. 158° dec. (11); this prod. on fusion or the original system htd. at 110-115° yields (11) dichloromaleinimide [Beil. XXI-401], m.p. 179° (11).

 \bar{C} on htg. with aniline (9) yields α -chloro- α -anilinomalein- α' -isoanil [Beil. XVII-555], greenish yel. cryst. from alc., m.p. 188.7-190 2° cor. (9), 187° (10).

3:3665 2,3-DICHLORONAPHTHALENE

Spar. sol. cold, eas. sol hot alc or ether

[For prepn. of \bar{C} from naphthalenetetrachloride-1,2,3,4 (3:4750) by htg. with Ag₂O in s.t. at 200° (1) or (in small yield together with other prods.) by boilg, with alc. KOH (3) (4) see indic. refs.; from 1,2,3-trichloronaphthalene (3:2125) with Na/Hg in alc. see (4).]

[$\ddot{\mathbf{C}}$ on monosulfonation in CS₂ with ClSO₃H yields (4) mainly 2,3-dichloronaphthalene-sulfonic acid-8 [Beil. XI-164] (corresp. sulfonyl chloride, m.p. 142°, corresp. sulfonamide m.p. 268°) accompanied by 2,3-dichloronaphthalenesulfonic acid-6 (?) [Beil. XI-183] (corresp. sulfonyl chloride, m.p. 178°)]

3:3665 (1) Leeds, Everhart, J. Am. Chem. Soc. 2, 210-212 (1880). (2) Hampson, Weissberger, J. Chem. Soc. 1936, 394 (3) Widman, Ber. 15, 2162 (1882) (4) Armstrong, Wynne, Chem. News 61, 273-275, 284 (1890).

3:3695 3,4-DICHLOROPHTHALIC ANHYDRIDE

[See also 3,4-dichlorophthalic acid (3:4880).]

Tbls. from CCl₄; sol. in C₆H₆, toluene, CHCl₃.

[For prepn. of \bar{C} from 3,4-dichlorophthalic acid (3:4880) by protracted htg. at 220° see (2); for formn. of \bar{C} (together with other isomers) from phthalic anhydride (1:0725) with Cl_2 at 240° in pres. of Fe or Fe salts (3), from phthalic anhydride or 3-chlorophthalic

anhydride (3:3900) with Cl_2 in fumg. H_2SO_4 in pres. of I_2 (4) (1), see indic. refs.] [For sepn. of $\tilde{\text{C}}$ from isomeric dichlorophthalic anhydrides by means of salts of corresp. acids see (4) (1) (18); by means of differential hydrolysis with H_2SO_4 (prods. with no α -chlorine such as 4,5-dichlorophthalic anhydride require H_2SO_4 of 98-100% conen.; those with one α -chlorine such as $\tilde{\text{C}}$ hydrolyze with 56-95% H_2SO_4 ; those with two α -chlorines such as 3,6-dichloro- or 3,4,5,6-tetrachlorophthalic anhydrides hydrolyze at H_2SO_4 conens. of less than 50%) see (5).]

Č dislvd. in abs. alc. yields one of the two known acid esters, viz., 3,4-dichloro-2-car-bethoxybenzoic acid, pr. from dil. alc., m.p. 164° (6); see also under 3,4-dichlorophthalic acid (3:4880).

[\bar{C} with PCl₅ htd. in s.t. at 200° for 6 hrs. gives exclusively (6) pseudo-3,4-dichlorophthaloyl dichloride (3,3,6,7-tetrachlorophthalide), ndls. from C₆H₆, m.p. 133° (6) (this prod. shaken with abs. alc. susp. of CaCO₃ for 10 hrs. yields (6) 6,7-dichloro-3,3-diethoxyphthalide, pr. from pet. ether., m.p. 79° (6), which depresses m.p. of normal diethyl 3,4-dichlorophthalate, m.p. 80° (6) to 60°).]

Č with 1 mole NH₂OH.HCl + Na₂CO₃ in aq. as directed (2) yields 3,4-dichlorophthalylhydroxylamine (N-hydroxy-3,4-dichlorophthalimide) [Beil. XXI-504], ndls. from MeOH, m.p. 218-219° (2), 216-219° (7) (this prod. with boilg. aq. Na₂CO₃ yields (2) (7) a mixt. of 3,4-dichloro-2-aminobenzoic acid (3,4-dichloroanthranilic acid) [Beil. XIV-367, XIV₁-(549)] and 5,6-dichloro-2-aminobenzoic acid (5,6-dichloroanthranilic acid [Beil. XIV-368]).

[Č with steam passed over cat. at 380-420° loses CO₂ presumably yielding (8) 2,3-di-chlorobenzoic acid (3:4650) and/or 3,4-dichlorobenzoic acid (3:4925).]

[\bar{C} with hydroquinone (1:1590) + H_3BO_3 htd. at 190° and afterward treated with hot cone. H_2SO_4 (9), or \bar{C} with AlCl₃ + NaCl htd. at 200–220° for 45 min. (10), or \bar{C} with p-chlorophenol (3:0475) htd. with fumg. H_2SO_4 + H_3BO_3 (11), gives 5,6-dichloro-1,4-dihydroxyanthraquinone (5,6-dichloroquinizarin) [Beil. VIII₁-(715)], red. ndls. from AcOH, m.p. 239° (10), 208° (9) (diacetate, m.p. 170° (10), 140° (9)).]

[For study of behavior of \bar{C} with o-chlorotoluene + AlCl₃ see (12); for use of \bar{C} with dibenzanthrone derivs. in prepn. of vat dyes see (13); for reactn. with p-cresol see (16).]

C on fusion with urea yields (14) 3,4-dichlorophthalimide, m.p. 348-351° (14) (for use in prepn. of pigments of phthalocyanine type see (14) (15)).

Č (1 pt.) dislvd. in 5 pts. boilg. AcOH and treated with 1 pt. aniline gives on cooling 97% yield 3,4-dichlorophthalanil [Beil. XXI₁-(391)], cryst. from AcOH, m.p. 181-181.5° cor. (1), ndls. from alc., m.p. 179-180° (17) [note, however, that on protracted htg. with excess aniline one of the two nuclear halogens also reacts, e.g., Č (1 pt.) boiled with 3 pts. aniline for 10 hrs. gives 4-chloro-3-anilinophthalanil, cryst. from alc., m.p. 159.5-160° cor. (1); note also that under certain conditions both halogens can be removed, e.g., 3,4-dichlorophthalanil (above) on refluxing 6 hrs. with aniline + anhydrous Na₂CO₃ + Cu gives (10% yield (17)) 3-anilinophthalanil, or.-yel. pr., m.p. 144.5-145° (17).]

 \bar{C} on saponification with standard alk. (Sap. Eq. = 108.5), followed by acidification, yields 3,4-dichlorophthalic acid (3:4880) q.v.

3:3720 4-CHLORONAPHTHOL-1 OH C₁₀H₇OCl Beil. VI - 611 VI₁-(308) VI₂-(582) M.P. 120-121° (1)

M.P. 120-121° (1) 120-120.5° (2) 120° (3) 116-117° (4) (26) 116° (5)

Ndls. from dil. alc. or from CHCl₃. — Very eas. sol. org. solv. — Sublimes in ndls. — Volatile with steam but less so than 2-chloronaphthol-1 (3:1490) (use in sepn from latter (6)).

[For prepn. of \tilde{C} from bis-(4-chloronaphthyl-1) carbonate (itself obtd. from bis-(α -naphthyl) carbonate in AcOH with Cl₂ in pres. of SbCl₃ (5)) by hydrolysis with alc. KOH see (5); from 4-chloronaphthyl-1 p-toluenesulfonate (itself obtd. from α -naphthyl p-toluenesulfonate in CCl₄ with Cl₂ + cat. (7)) by hydrolysis see (7); from α -naphthol (1:1500) with SO₂Cl₂ in CHCl₃ as directed (yields: 20–60% (1), 42% (6), 27–33% (8)) (26) (the isomeric 2-chloronaphthol-1 (3:1490) is also formed) see indic. refs.; from 1,4-dichloronaphthalene (3:1655) by htg. with MeOH/KOH in copper-lined autoclave 20 hrs. at 190–200° see (9); from 4-chloronaphthol-1-sulfonic acid-8 (10) (3) by hydrolysis (10) or reductive cleavage with Na/Hg (3) of the —SO₃H group see indic. refs.; from 4-chloro-1-hydroxynaphthoic acid-2 [Beil. X₁-(146)] by htg. in naphthalene or nitrobenzene in pres. of aniline (yield: 81–89%) see (2); from 4-chloronaphthyl-1 MgBr in ether by oxidn, with dry O₂ see (4).

 \bar{C} with Cl_2 in AcOH yields (4) 2,4-dichloronaphthol-1 (3:3250), m.p. 106° (4); \bar{C} with 1 mole Br_2 in AcOH gives alm. quant. yield (11) 2-bromo-4-chloronaphthol-1; ndls., m.p. 96° (11).

[\tilde{C} with 0.5 mole SCl₂ in CHCl₃ gives (79% yield (12)) bis-(4-chloro-1-hydroxynaphthyl-2) sulfide, colorless ndls. from hot alc., m.p. 172° dec. (12); for reactn. of \tilde{C} with 2-hydroxynaphthalene-1-sulfenyl bromide (13) (14), or with SCl₂ + β -naphthol (15), see indic. refs.]

[\bar{C} undergoes many condensations with various types of cpds.: e.g., for condensation of \bar{C} with formaldehyde (16) (17), with 2,6-bis-(hydroxymethyl)-4-methylphenol (18), and use of prods. as mothproofing cpds. see indic. refs.; for condensation of \bar{C} with naphthalene-2,3-dicarboxylic acid anhydride [Beil. XVII₁-(266)] see (19); for condensation of \bar{C} with malic acid (1:0450) or with ethyl acetoacetate (1:1710) or with ethyl methylacetoacetate (1:1712) using H_2SO_4 or P_2O_5 yielding naphthapyrone derivs. see (8); for condens. of \bar{C} with 2,3-dichloronaphthoquinone-1,4 (3:4857) for use in prepn. of vat dyes see (21).]

[Č with maleic anhydride (1:0625) + AlCl₃ + NaCl htd. ½ hr. at 210-220° gives (12% yield (20)) 10-chloro-1-hydroxyanthraquinone-4,9, dark red ndls. from C₆H₆, m.p. 205-206°; similarly Č with citraconic anhydride (1:1135) yields (20) both 10-chloro-1-hydroxy-2-methyl- and 10-chloro-1-hydroxy-3-methylanthraquinone-4,9]

[\bar{C} with 2,4-dinitrotoluene forms a mol. cpd., m.p. 65° (22); \bar{C} with 2,4-dinitroanisole forms a mol. cpd. (22); for use of these as fungicides see (22); for use of \bar{C} as disinfectant see (23).]

C with PkOH in CHCl₃ (5) forms an unstable mol. cpd., C.PkOH, or. ndls., m.p. 171° (5), 170-171° (4) (1).

Č with FeCl₃ or Ca(OCl)₂ in neutral soln. gives blue ppt. (5) (4)

- Č in alc. (10 pts.) treated with conc. HCl (5 pts.) and then with NaNO₂ (0.4 pt.) yields (2) 4-chloronaphthoquinone-1,2-oxime-2 [Beil. VII₁-(385)], purified via the beautifully crystg. dif. sol. red sodium salt, from which HCl ppts. the free oxime, pale yel. ndls., m.p. 157° (2).
 - ① 4-Chloro-1-naphthyl acetate: cryst. from lgr., m.p. 44° (4) (26). [From C with AcCl (2)] [For Fries rearr. of this acetate to 4-chloro-1-hydroxy-2-naphthyl methyl ketone see (24).]
 - —— 4-Chloro-1-naphthyl benzoate: ndls. from alc., m.p. 100-101° (25). [Reported only by indirect means (25).]

3:3750 2,6-DICHLOROBENZO-QUINONE-1,4

(m-Dichlorobenzoquinone)

[See also 2,6-dichlorohydroquinone (3:4600).]

Yellow cryst. from C_6H_6 or lgr.; yellow pr. from alc. or AcOH. — \bar{C} is somewhat solboilg, aq. or cold alc.; eas. sol. hot alc.; sol. CHCl₃. — Sublimes far below m.p.; volatile

with steam. — Č turns skin reddish brown. [For study of photochem. decompn. of alc. soln. see (43).]

[For prepn. of C from 2,6-dichlorohydroquinone (3:4600) with CrO₃ (7) or with excess aq. FeCl₃ soln. on warming (9) see indic. refs.; from 2,4,6-trichlorophenol (3:1673) on oxidn. with CrO₃ in AcOH at 30-40° (yields: 69% (3), 27% (10)) (2), with cold fumg. HNO_3 (25% yield (11)) (6), with mixt. of fumg. $HNO_3 + conc.$ H_2SO_4 (12), with PbO_2 in AcOH or in C₆H₆ (10) or in alc. with HNO₂ (13) (14) cf. (10), see indic. refs. (note that in addn. to C the crude oxidn. prod. contains also 2-chloro-6-(2',4',6'-trichlorophenoxy)benzoquinone-1,4, m.p. 134-135° (10), and 2,6-bis-(2',4',6'-trichlorophenoxy)benzoquinone-1,4, m.p. 245° (10), which resemble C in appearance, composition, and behavior); from 2.6-dichloro-4-fluorophenol (8) or its dimethyl ether (8) or from 2.6-dichloro-4-bromophenol (11) with ice-cold HNO₃ (D = 1.5) see indic. refs.; from 2,6-dichloro-4-nitrophenol [Beil. VI-241, VI₁-(122)] on htg. above its m.p. (125°) (15) or in small amt, with mixt, of fumg, HNO₃ + fumg. H₂SO₄ at ord. temp. (16); from 2,6-dichloro-4-aminophenol [Beil. XIII-512, XIII₁-(183)] by oxidn. with $K_2Cr_2O_7 + H_2SO_4$ (90% yield (1)) (17) see indic. refs.; from 3,5-dichloro-4-aminophenol [Beil. XIII-513] similarly see (18); from 2,6-dichloro-pphenylenediamine [Beil. XIII-118, XIII₁-(37)] by oxidn. with dichromate see (19) (10); from 2,6-dichloro-4-bromophenol bromide (4) or from "2,4,6-trichlorophenol bromide" (2,4,6-trichloro-6-bromocyclohexadiene-1,4-one-3) [Beil. VII-145] (5) with cold fumg. HNO₃ see indic. refs.; from 2,6-dichlorobenzoquinone-1,4-(2,4-dinitroanil)-4 [Beil. XII-754] on hydrolysis with dil. H₂SO₄ in s.t. at 200° see (20).]

[For study of bactericidal value of \bar{C} see (21); for use as vulcanization accelerator see (22); for condensation with β -naphthylamine and use of prods. as intermediates in prepn. of sulfur dyes see (23); for condensation with various amines to yield corresp. mono- and diarylaminoquinones see (24); for condensation with various aminophenols and use of prods. in prepn. of oxazine dyes see (25); for condensation of \bar{C} with ρ -aminoaryl mercaptans and use in prepn. of vat dyes see (26); for reactn. with Na₂S₂O₃ + AcOH in prepn. of sulfur dyes see (40).]

 \bar{C} on reductn. with aq. SO₂ gives (80% yield (3)) (27) (1) 2,6-dichlorohydroquinone (3:4600) (note, however, that \bar{C} in dil. aq. NaOH under N₂ with SO₂ is in part reduced to 2,6-dichlorohydroquinone (3:4600) and in part sulfonated to mono- and disulfonic acids of \bar{C} (28)). — [For studies of the oxidn.-reductn. potential of system \bar{C} + 2,6-dichlorohydroquinone see (3) (29) (30) (42)] — [\bar{C} forms with 2,6-dichlorohydroquinone the corresp. quinhydrone, brown prismatic ndls., m.p. 135° (31), but does so less readily than the benzoquinone-1,4/hydroquinone system (3); note that this same quinhydrone is obtd. (36) from \bar{C} + ord. hydroquinone (36).]

[Č in CHCl₃ at low temp. does not react with Cl₂ but at ord. temps. gives (22) tetrachlorobenzoquinone-1,4 (chloranil) (3:4978). — Č in AcOH at 15–20° gives (11) with 2 moles Br₂ 2,6-dichloro-3,5-dibromobenzoquinone-1,4 [Beil. VII-642], m.p. 291° (11), accompanied by a little 2,5-dichloro-3,6-dibromobenzoquinone-1,4 [Beil. VII-642], m.p. 292° (11); but Č in boilg. AcOH with 2 moles Br₂ gives exclusively the latter (11) cf. (19) (33).] [Č with conc. HCl gives on boilg. (34) both 2,3,5-trichlorobenzoquinone-1,4 (3:4672) and 2,3,5,6-tetrachlorobenzoquinone-1,4 (chloranil) (3:4978).]

[C in cold alc. treated dropwise with 10% alc. KOH gives first a green soln. turning to brownish red and pptg. in poor yield (2) a potassium salt of 2-chloro-3,6-dihydroxybenzo-quinone-1,4 [Beil. VIII-378]; C in satd. alc. soln. at 50-60° with conc. NH₄OH gives a purple soln. grad. turning brownish red and pptg. (20-25% yield (2)) 2-chloro-3,6-dihydroxybenzoquinone-1,4-diimide [Beil. VIII-379], bronze-colored lfts. from AcOH, subliming at 258-260° without melting.]

 $[\bar{C} \text{ (1 pt.) in alc. (15-20 pts.)} + \text{conc. HCl (0.3-0.4 pts.)} \text{ treated with aniline (0.25 pt.)}$

yields mainly (35) 2,6-dichloro-3-anilinobenzoquinone-1,4 [Beil. XIV-137], blue ndls. or lfts., m.p. 154° (35), and 2,6-dichlorohydroquinone (3:4600) accompanied by small amts. of 2-chloro-3,6-dianilinobenzoquinone-1,4 (see below); \bar{C} in either alc. or AcOH with excess aniline yields (35) 2-chloro-3,6-dianilinobenzoquinone-1,4 [Beil. XIV-143], brown lfts. from AcOH, m.p. 262° (35), and 2,6-dichlorohydroquinone (3:4600).] — [Note that \bar{C} with sulfanilic acid behaves similarly: e.g., \bar{C} with 2 moles sulfanilic acid in aq. (best in pres. of NaOAc) yields (37) 2-chloro-3,6-bis-(p-sulfoanilino)benzoquinone-1,4 together with 2,6-dichlorohydroquinone (3:4600); in aq. alc., however, 2,6-dichloro-3-(p-sulfoanilino)benzoquinone is also formed (37).]

[Č with NH₂OH.HCl in alc. yields (38) 2,6-dichlorobenzoquinone-1,4-monoxime-4, pale yel. Ifts. from dil. alc., m.p. 140° (38), which with cold conc. HNO₃ oxidizes to 2,6-dichloro-4-nitrophenol [Beil. VI-241], colorless ndls. from aq., Ifts. from AcOH, tbls. from ether, m.p. 125° dec.; note that no dioxime can be formed]

[Č with semicarbazide HCl in cold dil. alc. gives (39) 2,6-dichlorobenzoquinone-1,4-semicarbazone-4, in red or yel. forms acc. to conditions, but both of m.p. 218° dec. (39); note that no bis-semicarbazone can be formed.]

[C with 20% soln, of triphenylphosphine in CHCl₃ gives an orange-red, red, or brown color (41) (also shown by trichlorobenzoquinone and by chloranil); for other limitations and details see (41).

3:3780 4-CHLORO-3-HYDROXYBENZ- ClOHO C7H5O2Cl Beil. S.N. 748 ALDEHYDE

M.P. 121° (1) (2)

Colorless ndls. (1).

[For prepn. of Č from m-hydroxybenzaldehyde (1:0055) via 4-nitro-3-hydroxybenzaldehyde, reduction to amino cpd., and use of appropriate diazo reactn. see (1).]

Č in 50% AcOH mononitrated as specified (2) gives mainly 4-chloro-2-nitro-3-hydroxy-benzaldehyde, spar. sol. in hot CHCl₃, colorless pr. from AcOH, m.p. 175° (2) (3). [Note that this statement takes account of a very important correction (3).] [This 4-chloro-2 nitro-3-hydroxybenzaldehyde yields the following derivs.: p-nitrophenylhydrazone, deep maroon ndls. from hot AcOH, m.p. 275-276° dec.; semicarbazone, lt. or. ndls. from alc., m.p. 265-266° dec. (2).]

Č in aq. contg. NaHCO₃ treated with (CH₈)₂SO₄ yields (1) 4-chloro-3-methoxybenzaldehyde, m.p. 52° (1). [This prod. depresses m.p. of corresp. methyl ether of the isomeric 2-chloro-3-hydroxybenzaldehyde (3:4085), m.p. 56-57° (1); on keeping it acquires a beautiful silver-gray color (1); it yields an oxime, colorless ndls., m.p. 98-99°, and a p-nitrophenylhydrazone, old-gold ndls., m.p. 251° (1).]

- 4-Chloro-3-hydroxybenzaldoxime: colorless ndls. of hydrate, dec. 106-110° from dil. alc.; anhydrous oxime, m.p. 126° (1).
- ---- 4-Chloro-3-hydroxybenzaldehyde phenylhydrazone: unrecorded.
- 4-Chloro-3-hydroxybenzaldehyde p-nitrophenylhydrazone: violet-red ndls. from dil. alc., m.p. 226-227° (1).
- 4-Chloro-3-hydroxybenzaldehyde 2,4-dinitrophenylhydrazone: unrecorded.
- 4-Chloro-3-hydroxybenzaldehyde semicarbazone: pale yel. ndls., m.p. 238-239° (1).
 3:3780 (1) Hodgson, Beard, J. Chem. Soc. 1926, 150-154. (2) Hodgson, Beard, J. Chem. Soc. 1926, 2033-2034. (3) Hodgson, Beard, J. Chem. Soc. 1927, 2377-2378.

3:3810 7-CHLORONAPHTHOL-1

M.P. 123° (1)

Ndls. from aq. or CS_2 ; spar. sol. aq. — \bar{C} has odor suggesting that of iodoform.

[For prepn. of \tilde{C} from γ -(p-chlorophenyl)paraconic acid [Beil. XVIII-421] by distn. see (1).]

 \tilde{C} dis. in aq. alk. from which it is repptd. by CO_2 ; the alk. soln. of \tilde{C} couples with diazonium salts yielding azo dyestuffs (1).

C with aq. FeCl₃ gives a yellowish white ppt. which on stdg. assumes a pronounced violet color (1).

Č (1 mole) with PkOH (1 mole) in CHCl₃ yields an addn. cpd., Č.PkOH, or.-red. ndls. from hot CHCl₃, m.p. 139° (1).

--- 7-Chloro-1-naphthyl acetate: oil.

3:3810 (1) Erdmann, Kirchhoff, Ann. 247, 374-375 (1888).

3:3840 1,4-DICHLORONAPHTHOL-2

(3)

M.P. 123-124° (1)

122-123° (2)

121°

Ndls. from lgr.; eas. sol. alc., ether, or AcOH. [For prepn. of Č from 1,1-dichloro-2-keto-1,2-dihydronaphthalene, m.p. 54° (2), 48-50°

(3) (itself prepd. from naphthol-2 (1:1540) in AcOH + NaOAc soln. with Cl₂ (2) (3)), by shaking with satd, soln. of HCl gas in AcOH for 2-3 min. (2) (3) see indic. refs.; from 1,1,3,4-tetrachloro-2-keto-1,2,3,4-tetrahydronaphthalene [Beil. VII-371] by partial reduction with SnCl₂ in AcOH (poor yield) see (1); from 1-chloronaphthol-2 (3:1700) with SO₂Cl₂ at ord. temp. (4) (note that this prepn. undoubtedly involves intermediate forms. of 1,1-dichloro-2-keto-1,2-dihydronaphthalene (above) (2)) see indic. refs.; from 1,4,5-trichloronaphthol-2 [Beil. VI-650] by partial reduction with Na/Hg see (4).]

[C in AcOH with Cl₂ gives (1) 1,1,4-trichloro-2-keto-1,2-dihydronaphthalene [Beil.

VII-386], m.p. 86-87°, together with other oily by-products.]

Č with SnCl₂/AcOH/HCl in s.t. at 100° for 8 hrs. gives (72% yield (2)) (3) 4-chloronaphthol-2 (3:3045), mp. 103-104°.

 \tilde{C} in AcOH mixed with conc. HNO₃ (D=1.42) and cautiously warmed until the liq. shows intense red color, then poured into aq., yields (1) 4-chloro-3-nitronaphthoquinone-1,2 [Beil. VII-724], red ndls. from AcOH, m.p. 184° (1).

 \bar{C} with aq. alc. Na₂SO₃ boiled 72 hrs. gives in poor yield (2) 4-chloronaphthol-2-sulfonic acid-1, cryst. from aq. with ½ H₂O (not lost at 100° in vac.); note that this prod. on hydrolysis with H₂SO₄ gives (91% yield (2)) 4-chloronaphthol-2 (3:3045), m.p. 103-104°.

(D) 1,4-Dichloro-2-naphthyl acetate: m.p. 90-91° (1). [From C with AcCl (1).]

3:3840 (1) Zincke, Kegel, Ber. 21, 3387-3389 (1888). (2) Burton, J. Chem. Soc. 1945, 280-283. (3) Fries, Schimmelschmidt, Ann. 484, 293, 295-296 (1930). (4) Armstrong, Rossiter, Chem. News 63, 136 (1891); Proc. Chem. Soc. 7, 32 (1891).

3:3860 3,3'-DICHLOROBENZOPHENONE
$$C_{13}H_8OCl_2$$
 Beil. S.N. 652 (Di-(m-chlorophenyl) ketone)

M.P. 123.8-124.9° (1) B.P. 160-166° at 2 mm. (1)

[For prepn. of \tilde{C} from *m*-chlorobromobenzene [Beil. V-209, V₁-(115), V₂-(161)] (2) via conversion to *m*-chlorophenyl MgBr (cf. (3)) and reaction with *m*-chlorobenzonitrile [Beil. IX-339] (4), followed by hydrolysis (77% yield), see (1).]

(1). 3,3'-Dichlorobenzophenone 2,4-dinitrophenylhydrazone: mp. 235-238° (1).

3:3860 (1) Haller, Bartlett, Drake, Newmann, Cristol, et al., J. Am. Chem Soc. 67, 1600-1602 (1945). (2) Hartwell, Org. Syntheses 24, 22-24 (Note 5) (1944). (3) Hein, Retter, Ber. 71, 1968 (1938). (4) Korczynski, Fandrich, Compt. rend. 183, 421-423 (1926); Cent. 1926, II 1853; C.A. 21, 77 (1927).

3:3900 3-CHLOROPHTHALIC ANHYDRIDE

[See also 3-chlorophthalic acid (3:4820).]

[For prepn. of \bar{C} from 3-chlorophthalic acid (3:4820) by distn. see (4) (2); from 3-nitrophthalic anhydride [Beil. XVII-486, XVII₁-(256)] by htg with PCl₅ in s.t. 6 hrs. at 175° (5) or 9 hrs. at 220° (60% yield (1)) or with Cl₂ at 240° (6) see indic. refs.; from phthalic anhydride (1:0725) with Cl₂ at 240° in pres. of Fe or Fe salts see (7).]

[C with Cl₂ in fumg. H₂SO₄ in pres. of I₂ gives (8) a mixt. contg. 3 pts. 3,6-dichlorophthalic anhydride (3:4860), m.p. 194° cor., and 1 pt. 3,4-dichlorophthalic anhydride (3:3695), m.p. 120-121°, b.p. 329°.]

[The neutral dimethyl and diethyl esters corresp. to \bar{C} are unreported; ethyl hydrogen 3-chlorophthalate has m p. 118-119° (3).]

[\tilde{C} with PCl₅ (3) or with SOCl₂ + ZnCl₂ in s.t. at 200-240° (9) yields 3-chlorophthaloyl (di)chloride, b.p. 169-171° at 16 mm. (3)]

 \bar{C} with urea on fusion at 170° gives (3) 3-chlorophthalimide, cryst from AcOH, m.p. 233° (3), 236° (15). — \bar{C} with 1 mole aniline htd. at 200–220° until no more steam is evolved (14) or \bar{C} with 1 mole aniline in boilg. AcOH (14) gives quant. yield 3-chlorophthalimide (N-phenyl-3-chlorophthalimide), pale cream-colored ndls from AcOH, m.p. 189–190° (14); \bar{C} similarly treated with p-toluidine gives (80–90% yield (14)) N-(p-tolyl)-3-chlorophthalimide, colorless ndls. from AcOH, m.p. 160.5° (14).

[Č with pyrocatechol (1:1520) + AlCl₃ + NaCl htd. at 130-138° gives (10) an intermediate prod. (presumably 3-chloro-2-(o,m-dihydroxybenzoyl)benzoic acid), yel. cryst. from AcOH, mp. 187° (10), which with cone. H₂SO₄ yields (10) 8-chloro-1,2-dihydroxyan-thraquinone (5-chlorohystazarin), yel. cryst. from pyridine, mp. 187° (diacetate, m.p. 193° (10)). — Č with hydroquinone (1:1590) + AlCl₃ + NaCl htd. at 200-220° for 40-50 min. yields (11) 8-chloro-1,4-dihydroxyanthraquinone (5-chloroquinizarin), red cryst. from xylene, m.p. 243° (diacetate, m.p. 205°, dimethyl ether, m.p. 208° (11)).]

[\bar{C} with C_6H_6 + AlCl₃ yields (12) 6-(3?)-chloro-2-(benzoyl)benzoic acid, m.p. 233.5°, which with conc. H_2SO_4 for 4 hrs. at 95° gives (59% yield (12)) 1-chloroanthraquinone (3:4480), m.p. 162° (12). — \bar{C} with p-xylene + AlCl₃ gives (81% yield (13)) 6-(3?)-chloro-2-(2,5-dimethylbenzoyl)benzoic acid, pr. from AcOH, m.p. 215°, which on warming with 9 pts. fumg. H_2SO_4 (10% SO_3) gives (96% yield (13)) 1-chloro-5,8-dimethylanthraquinone, yel. ndls. from AcOH, m.p. 186°.]

Č on boilg. with dil. HCl (1) or Č on saponification with standard alk. (Sap. Eq. = 91.3) followed by acidifn. gives 3-chlorophthalic acid (3:4820) q.v.

3:3900 (1) Smith, J. Chem. Soc. 1933, 1643-1644. (2) Guareschi, Gazz. chim. ital. 17, 122 (1887). (3) von Braun, Larbig, Kredel, Ber. 56, 2338 (1923). (4) Krüger, Ber. 18, 1759 (1885). 3:3925 7-CHLORONAPHTHOL-2

M.P. 126.5° (1)

White lfts. from lgr.

[For prepn. of C from 7-hydrazinonaphthol-2 [Beil. XV-613] by treatment of its soln. in dil. HCl with CuSO₄ (19% yield) see (1).]

[\bar{C} (as sodium salt) treated with CO₂ at 230-250° and 45 atm. press. yields (2) 7-chloro-2-hydroxynaphthoic acid-3, yellowish lfts. from AcOH, m.p. 277-278° (2)]

0 7-Chloro-2-naphthyl acetate: lfts. from toluene, m.p. 104.5° (1). [From $\ddot{\textbf{C}}$ on refluxing with acetyl chloride (1).]

3:3925 (1) Franzen, Deibel, J. prakt. Chem. (2) 78, 154 (1878). (2) Lange, Luce, Jacobs (to I.G.), Ger. 564,128, Nov. 14, 1932; Cent. 1933, II 446.

3:3934 p-PHENYLPHENACYL CHLORIDE

(ω -Chloro-p-phenylacetophenone; chloromethyl p-xenyl ketone; 4-(chloroacetyl)biphenyl)

M.P. 126-127° (1) 122-123° (2) (3)

Pale vel. ndls. from dil. alc.

[For prepn. of C from biphenyl (1:7175) with chloroacetyl chloride (3:5235) + AlCl₃ (41% yield (2)) (3), or with chloroacetic acid anhydride (3:0730) + AlCl₃ (77% yield (2)), see indic. refs.]

[C with chloroacetyl chloride (3:5235) + AlCl₃ gives (52% yield (2)) 4,4'-bis-(chloroacetyl)biphenyl, ndls. from di-n-propyl ketone or cyclohexanone, m.p. 228-229° (2), 226-227° (4); note that this prod. with excess piperidine yields (4) 4,4'-bis-(piperidinoacetyl)biphenyl, brownish yel. pdr. from acetone, m.p. 143-144° (4).

[C with piperidine has not been directly reported but should yield 4-(piperidinoacetyl)biphenyl, ndis. from abs. alc., m.p. 93-94° (4), as has been demonstrated for the analogous p-phenylphenacyl bromide.]

Č with salts of acids should yield the corresp. p-phenylphenacyl esters (for table of examples see Vol. I, p. 652) although the usual reagt. for this purpose is the more common p-phenylphenacyl bromide.

 \tilde{C} with calcd. amt. of KMnO₄ in aq. alk. at 100° is oxidized (3) to p-phenylbenzoic acid [Beil. IX-671, IX₁-(280)], m.p. 217-218° (3) (228°).

3:3934 (1) Eastman Kodak Co., List No. 34 (1944). (2) Silver, Lowy, J. Am. Chem. Soc. 56, 2429-2430 (1934). (3) Collet, Bull. soc. chim. (3) 17, 510 (1897). (4) Carpenter, Turner, J. Chem. Soc. 1934, 872.

3:3945 5-CHLORONAPHTHOL-2

M.P. 128° u.c. (1)

Ndls.; sol. alc., AcOH, C₆H₆, CS₂. — Sublimes; volatile with steam.

[For prepn. of \bar{C} from salts of 2-hydroxynaphthalenesulfonic acid-5 [Beil. XI-282] by htg. with PCl₅, then distilling with steam, see (1).]

3:3945 (1) Claus, J. prakt. Chem. (2) 39, 317 (1889).

3:3952 4,6-DICHLORO-3-HYDROXY-BENZALDEHYDE

M.P. 130° (1) 129° (2)

Fairly eas. sol. hot aq.; eas. sol. C_6H_6 , alc.; insol. lgr. — Volatile with steam. \bar{C} has very pronounced sternutatory props. and also attacks moist skin producing painful blisters (2).

[For prepn. of \bar{C} from 4,6-dichloro-3-methylphenol (3:1745) via conv. to bis-(4,6-dichloro-3-methylphenyl) carbonate, chlorination of latter, and subsequent alk. hydrol. of the chlorination prod. see {1}; for formin. (in small amt. together with much 2,6 isomer) from 6-chloro-3-hydroxybenzaldehyde (3:3350) or from m-hydroxybenzaldehyde (1:0055) in AcOH with Cl_2 see {2}.]

 \bar{C} in 4 pts. AcOH + 1 pt. aq. treated grad. with 1 pt. conc. HNO₃ (D=1.4) yields (1) 4,6-dichloro-2-nitro-3-hydroxybenzaldehyde, m.p. 157° (1); this prod. with acetone and alk. yields (1) the corresp. indigoid, viz , 4,4,6,6-tetrachloro-7,7-dihydroxyindigo.

4,6-Dichloro-3-methoxybenzaldehyde: ndls. from C₆H₆, m.p. 117° (1).

3:3952 (1) Friedlander, Schenck, Ber. 47, 3048, 3051 (1914). (2) Hodgson, Beard, J. Chem. Soc. 1926, 148-149, 152.

3:3956 o-CHLOROPHENYLPROPIOLIC C₉H₅O₂Cl Beil. S.N. 950 ACID C=C—COOH

M.P. 131-132° (1) (2) 131° (3)

Cryst. from 50% AcOH or C6H6.

[For prepn. of C from o-chlorobenzaldehyde (3:6410) by conversion through o-chlorocinnamic acid to ethyl o-chlorocinnamate, thence by addn. of Br₂ to give ethyl β -(o-chlorophenyl)- α , β -dibromopropionate, followed by elimination of 2 HBr and saponification (or vice versa) with alc. KOH, and final acidification (68% yield (1)) (2) cf. (3), see indic. refs.]

 \bar{C} suspended in aq., treated with NaHCO₃ + CuCl₂, and steam-distilled (1) or \bar{C} with Cu(OAc)₂ (2) loses CO₂ giving (66% yield) o-chlorophenylacetylene (3:9497).

3:3956 (1) Bergmann, Bondi, Ber. 66, 282-283 (1933). (2) Otto, J. Am. Chem. Soc. 56, 1393-1394 (1934). (3) Wilson, Wenzke, J. Am. Chem. Soc. 57, 1265-1267 (1935).

3:3960 5-CHLORONAPHTHOL-1

M.P. 131.5° (1)

Ndls. from aq., lfts. from CS_2 ; spar. sol. aq. $-\bar{C}$ has characteristic odor.

[For prepn. of \tilde{C} from γ -(2-chlorophenyl)paraconic acid [Beil. XVIII-421] on rapid distn. see (1).]

[For condensation of C with subst. isatin chlorides in prepn of indigoid dyes see (2).]

C dis. in aq. alk. and this soln couples (1) with diazonium salts yielding azo dyestuffs.

C with aq. FeCl₃ gives a yellowish-white ppt. unchanged on stdg; C with Ca(OCl)₂ soln, gives a pale violet ppt. (1).

- Č (1 mole) in CHCl₃ on mixing with PkOH (1 mole) in CHCl₃ gives (1) ppt. of addn. epd., Č.PkOH, orange ndls. from hot CHCl₃, m.p. 160° (1).
 - **5-Chloro-1-naphthyl acetate:** lfts. from alc., m.p. 53° (1). [From C on protracted boilg, with AcCl (1).]

3:3960 (1) Erdmann, Kirchhoff, Ann. 247, 372-374 (1888). (2) I.G., Brit. 318,107, Oct. 23, 1929; Cent. 1930, I 1383.

3:3965 TETRACHLOROBENZO-QUINONE-1,2

(Tetrachloro-o-quinone)

 $\begin{array}{c} Cl \\ Cl \\ Cl \\ Cl \end{array}$ $\begin{array}{c} Cl \\ Cl \\ Cl \\ \end{array}$ $\begin{array}{c} Cl \\ Cl \\ \end{array}$

[See also tetrachloropyrocatechol (3:4875).]

Red cryst. pdr. (1), cryst. from dil. AcOH (2).

[For prepn. of C from tetrachloropyrocatechol (3:1520) by oxidn. with fumg. HNO₃ in AcOH (81% yield (1)) (2) (3) (4) (5) (6) see indic. refs.; from pyrocatechol (1:1520) (2) (3) or pyrocatecholsulfonic acid (7) with Cl₂ in AcOH see indic. refs.; from tetrachloropyrocatechol monomethyl ether (tetrachloroguaiacol) (8) or from tetrachloropyrocatechol dimethyl ether (tetrachloroveratrole) (8) by oxidn. with HNO₃ see indic. refs.]

[C adds 1 mole Cl₂ yielding (9) hexachlorocyclohexene-3-dione-1,2 [Beil. VII-575] q.v. which on reduction with SnCl₂ in AcOH (3) gives tetrachloropyrocatechol (3:4875).]

[C with PCl₅ (2 moles) htd. in s.t. at 200–210° for $\frac{1}{2}$ hr. gives (10) hexachlorobenzene (3:4939) and other products.]

[For complex behavior of \bar{C} on htg. with aq., with cold alcs., or with aniline see Beil. VII-602, VII₁-(338).]

 $\bar{\rm C}$ forms addn. cpds. with many hydrocarbons [e.g., $\bar{\rm C}$ with benzene gives $\bar{\rm C}.3{\rm C}_6{\rm H}_6$, m.p. 37-42° (11); $\bar{\rm C}$ with toluene gives $\bar{\rm C}.{\rm C}_7{\rm H}_8$, m.p. 45-50° (11); $\bar{\rm C}$ with hexamethylbenzene (1:7265) gives $\bar{\rm C}.{\rm C}_{12}{\rm H}_{18}$, greenish black ndls. from AcOH, m.p. 140-143° (11),

C with equiv. tetrachloropyrocatechol (3:4875) in least possible hot CHCl3 gives on

cooling the corresp. quinhydrone (6). — [For study of oxidn.-reductn. potential of system $\bar{C}/\text{tetrachloropyrocatechol}$ see (4) (5).]

3:3985 5,7-DICHLORONAPHTHOL-1

M.P. 132° (1) (2)

Pale yel. pr. (from CS₂) (1) (2). — Somewhat sol. hot aq.

[For prepn. from γ -(2,4-dichlorophenyl)paraconic acid [Beil. XVIII-421] by distn. see (2)

C with FeCl₃ gives a white ppt. which on htg. with excess reagt. colors violet (2).

Č in dil. alk, soln, couples with diazotized naphthionic ac (1-aminonaphthalenesulfonic acid-4) giving intense purple color (2).

C on distn, with Zn dust yields naphthalene (1:7200) (2) (1).

5,7-Dichloro-1-naphthyl acetate: from C on protracted refluxing with 4 pts. AcCl; pr. (from CHCl₃ + lgr.), m p 110° (2).

3:3985 (1) Erdmann, Schwechten, Ber. 21, 3444 (1888). (2) Erdmann, Schwechten, Ann. 275, 284–285 (1893).

CHAPTER X

DIVISION A. SOLIDS

(3:4000-3:4499)

3:4000 4-CHLORONAPHTHO-QUINONE-1,2

M.P. 132-136° dec. (1)
[188° (2) see text]

Orange-red ndls. from C_6H_6 by addn. of lgr.; \bar{C} could not be further purified by recrystallization since some decompn. always occurred (1)

[For prepn. of \bar{C} from 1,4-dichloronaphthol-2 (3:3840) by conversion (59% yield) with HNO₃ in AcOH to 1,4-dichloro-1-nitro-2-keto-dihydronaphthalene, followed by subsequent elimination of NOCl by boiling with C_6H_6 (80% yield), see (1). — Note that the prod. of m.p. 188°, maroon ndls. from alc., obtd. (2) from 4-chloro-1,2-diaminonaphthalene (4-chloronaphthylenediamine-1,2) by air oxidn., is regarded as \bar{C} ; this discrepancy is unexplained.]

Č on reductive acetylation with Ac₂O + NaOAc + Zn dust loses its halogen atom giving (60% yield (1)) 1,2,4-triacetoxynaphthalene [Beil. VI-1133], m p. 134-135° (1).

[Č with 2,3-dimethylbutadiene (1:8050) in specially purified CHCl₃ in st. at 100° in dark for 72 hrs. undergoes a Diels-Alder type addition only very slowly (1); no intermediate addn. prod. could be isolated (difference from the isomeric 3-chloronaphthoquinone-1,2 (3:4704)), but on stdg. the soln. slowly deposits (15% yield (1)) 2,3-dimethylphenanthraquinone, mp. 237-238° u.c.; 242-243° cor. (1).]

4-Chloronaphthoquinone-1,2-oxime-2 (4-chloro-2-nitrosonaphthol-1) [Beil. VII₁-(385)]: pale yel. ndls., m.p. 157°. [Prepd. indirectly.]

3:4000 (1) Fieser, Dunn, J. Am. Chem. Soc. 59, 1019-1020 (1937). (2) Hodgson, Elliott, J. Chem. Soc. 1935, 1853.

3:4005 1,4,5-TRICHLORONAPHTHALENE

M.P. 133° (1) 131° (2) (3) (4) 129° u.c. (3)

Ndls. from alc. in which Č is spar. sol. — Volatile with superheated (3) steam. [For formn. of Č from sodium 1,5-dinitronaphthalenesulfonate-4 (1) with HCl + NaClO₃ 360

see (1); for prepn. of Č from 1,5-dichloro-4-nitronaphthalene [Beil. V-556] (3), from 1,4-dichloro-5-nitronaphthalene [Beil. V-556, V₁-(264)] (4) (3), from 4-chloro-1,5-dinitronaphthalene [Beil. V-561] (3), from 1-chloro-4,5-dinitronaphthalene [Beil. V-561] (3), from 4,5-dichloronaphthalenesulfonyl chloride-1 [Beil. XI-162] (5), from 4-chloro-5-nitronaphthalenesulfonyl chloride-1 [Beil. XI-170] (6), from 5-chloro-4-nitronaphthalenesulfonyl chloride-1 [Beil. XI-170] (6), from 1-chloro-4-nitronaphthalenesulfonyl chloride-5 [Beil. XI-170] (6), or from 4-chloronaphthalene-1,5-bis-(sulfonyl chloride) [Beil. XI-213] (7) (2), each with PCl₆ as directed, see indic. refs.]

[C treated with ClSO₃H in CS₂ and reactn. prod. conv. to salts as directed (2) yields a mixt. of two sulfonates, viz., one derived from 1,4,5-trichloronaphthalenesulfonic acid-7 (corresp. sulfonyl chloride, m.p. 118° (2)) and the other derived from 1,4,5-trichloronaphthalenesulfonic acid-X (corresp. sulfonyl chloride, m.p. 178° (2)).

 $[\bar{C}$ on oxidn. with dil. HNO₃ in s.t. yields (3) a dichloro acid, presumably 3,6-dichlorophthalic acid (3:4870).]

3:4005 (1) Friedlander, Karamessinis, Schenk, Ber. 55, 47 (1922). (2) Turner, Wynne, J. Chem. Soc. 1941, 247, 254-255. (3) Atterberg, Ber. 9, 1187, 1733-1734 (1876). (4) Widman, Bull. soc. chim. (2) 28, 511 (1877). (5) Armstrong, Wynne, Chem. News 61, 273 (1890). (6) Cleve, Chem. Ztg. 17, 398 (1893). (7) Armstrong, Wynne, Chem. News 62, 163 (1890).

Colorless cryst. with camphoraceous odor; extremely volatile and readily sublimes; insol. aq. and volatile with steam; purified by sublimation or crystn. from boilg. MeOH.

[For prepn. of \bar{C} from 2,2,3-trimethylbutanol-3 (pentamethylethanol) [Beil. I-418, I₁-(207), I₂-(447)] (3) or its hydrate (1) with fumg. HCl (2) (3), with PCl₅ (1) or with AcCl (3:7065) (46% yield (4)) see indic. refs.; from 2,2,3-trimethylbutane ("triptane") (1:8544) with ter-butyl chloride (3:7045) + AlCl₅ by shaking 30-45 seconds (16% yield) see (4).]

C with alc. AgNO₃ ppts. AgCl even in cold (3).

 \tilde{C} with Mg in dry ether gives RMgCl; this upon oxidn. with O_2 and subsequent hydrolysis yields (2) 2,2,3-trimethylbutanol-2, m.p. 80° (2).

C converted to RMgCl and the latter treated with CO₂ yields (2) ter-butyl-methylacetic acid [Beil. II₂-(150)], m p. 80° (2).

3:4020 (1) Butlerow, Ann. 177, 183-184 (1875). (2) Richard, Ann. chim. (8) 21, 356-358 (1910). (3) Henry, Compt. rend. 142, 1024 (1906); Rec. trav. chim. 26, 104 (1907). (4) Bartlett, Condon, Schneider, J. Am. Chem. Soc. 66, 1533, 1537 (1944).

3:4030 2,4,6-TRICHLOROPHLORO-GLUCINOL

Cryst. from abs. alc. — Note that from aq. \bar{C} cryst. as a trihydrate (1), but on htg. this hydrate loses aq. before melting (2); note also that \bar{C} on recrystn. from toluene gives a solvated prod., m.p. $108-109^{\circ}$ (1). [For study of crystallography of \bar{C} see (4).]

 $\bar{\mathbf{C}}$ is alm. insol. aq. or cold $\mathbf{C}_6\mathbf{H}_6$; sol. alc. — $\bar{\mathbf{C}}$ readily sublimes.

[For prepn. of \bar{C} from phloroglucinol (1,3,5-trihydroxybenzene) (1:1620) with Cl_2 in CCl_4 (crude yield 76% (1)) or in AcOH (5) see indic. refs.; note that attempts (6) (7) to prepare \bar{C} from phloroglucinol (1:1620) with Cl_2 in aq. soln. were not effective owing to further decompn. of the prod. into dichloroacetic acid (3:6208) and/or the tetrahydrate of sym.-tetrachloroacetone (3:6050) cf. (1)

[For forms. of C from phloroglucinol (1:1620) with SO₂Cl₂ in dry ether see (3)]

[For formn. of \bar{C} from hexachlorocyclohexanetrione-1,3,5 ("hexachlorophloroglucinol") [Beil. VII-854, VII₁-(469)] by reduction with SnCl₂ or KI see (7)]

 \bar{C} dis. in hot cone. HCl from which on cooling it separates in fine ndls; \bar{C} with warm dil. HNO₃ is decomposed with forms. of oxalic acid (1.0445); \bar{C} with cone. H₂SO₄ dissolves unchanged on gentle warming, but on contd htg. HCl is evolved and soln turns deep sage-green (1).

 \tilde{C} dissolves in aq alk. but is repptd. unchanged upon acidification; note, however, that alk. soln. of \tilde{C} on stdg in air develops a purple color (1)

- $[\bar{C} \text{ in AcOH} \text{ added to excess Br}_2/\text{aq.}$ undergoes ring cleavage with form. of 1,1,3,5,5-pentabromo-1,3,5-trichloropentanedione-1,4 [Beil I-786], colorless cryst. from pet. ether, m.p. 93-95°, to a turbid liq. becoming clear at 98° (8).]
- 3:4030 (1) Webster, J. Chem. Soc. 47, 423-426 (1885). (2) Zincke, Kegel, Ber. 23, 1731-1732 (1890). (3) Peratoner, Finocchiaro, Gazz. chim. stal. 24, I 243-244 (1894). 3:4040 2,6-DICHLORONAPHTHALENE

Tbls. from ether $+ C_6H_6$, ndls. from hot alc., pr. from AcOH. — Spar. sol. alc.; eas. sol. ether, C_6H_6 , or CHCl₃. — Volatile with steam.

[For prepn. of \tilde{C} from naphthalene-2,6-bis-(sulfonyl chloride) [Beil. XI-216] (8) (10), from 6-chloronaphthalene-2-sulfonyl chloride [Beil. XI-180] (45% yield (2)) (1) (9), from 6-bromonaphthalene-2-sulfonyl chloride [Beil. XI-184] (11), from salts of 2-hydroxy-naphthalenesulfonate-6 [Beil. XI-282, XI₁-(66)] (59% yield (3)) (4) (5), or from 6-bromonaphthol-2 [Beil. VI-651] (55% yield (12)) with PCl₅ as directed, see indic. refs; from 6-sulfonaphthylamine-2 [Beil. XIV-760, XIV₁-(735)] by treatment of corresp. diazonium chloride with PCl₅ in POCl₃ see (13) (14); from 2,6-diaminonaphthalene [Beil. XIII-208] via tetrazotization in HCl followed by htg. with Cu pdr see (6); from sodium β-naphthalenesulfonate [Beil. XI-171, XI₁-(38)] with KClO₃ + boilg. dil. HCl (50% yield) see (15).] (\tilde{C} in CHCl₃ satd with Cl₃ gives (9% yield (20)), 1.2 6-triplepropaphthylana (3:2515).

 $[\tilde{C} \text{ in CHCl}_3 \text{ satd. with Cl}_2 \text{ gives } (9\% \text{ yield } \{20\}) 1,2,6-\text{trichloronaphthalene } (3:2515), m.p. 92^\circ.]$

 \bar{C} on oxidn. with dil. HNO₃ (D=1.2) in s t at 150° (16) or better with dil. HNO₃ (D=1.13) in s t. at 190-200° (17) yields 4-chlorophthalic acid (3.4390), m.p. 148° u.c. (17). — \bar{C} on oxidn. with CrO₃/AcOH yields (18) 2,6-dichloronaphthoquinone-1,4 [Beil. VII-730], bright yel. ndls., m.p. 149-149° (18), this cpd. also accompanies (18) the 4-chlorophthalic acid of the same m.p. during HNO₃ oxidn. (above).

[\overline{C} on mononitration yields (16) two isomers, one m.p. 139-139.5°, the other m.p. 113.5-114° (16)

[Č in CS₂ treated with ClSO₃H yields (19) 2,6-dichloronaphthalenesulfonic acid-4 [Beil. XI-162] (corresp. sulfonyl chloride, m.p. 136°, corresp. sulfonamide, m.p. 269°).]

3:4052 2,3,5-TRICHLOROHYDROQUINONE OH $C_6H_3O_2Cl_3$ Beil. VI - 850 VI₁— VI₂-(846)

[See also 2,3,5-trichlorobenzoquinone-1,4 (3:4672).]

Colorless shining pr. from aq. rapidly losing their luster in air (3); transparent pr. with 1 mole AcOH from AcOH but solvated AcOH readily lost in air (5).

Č at 15° is sol. in 160 pts. aq. (6); Č is spar. sol. cold aq. but cas. sol. hot aq. in which it first melts to an oil (3); Č is eas. sol. alc. or ether.

C readily sublimes in lfts. (4); for study of sublimation press. see (7).

[For study of heat of forms. of \bar{C} see (8); for studies of heat of combustion of \bar{C} see (5) (9).]

[For detn. of chlorine in \bar{C} by hydrogenation at elevated temp. see (10); for patent on use of \bar{C} as vulcanization accelerator see (11).]

PREPARATION OF C

From trichlorobenzoquinone. [For prepn. of Č from 2,3,5-trichlorobenzoquinone-1,4 (3:4672) by reduction with aq. SO₂ (3) (4) (6) (12) in ether (1), or from "benzoquinone tetrachloride" (2,3,5,6-tetrachlorocyclohexanedione-1,4) [Beil. VII-557] with aq. SO₂ (13), see indic. refs.]

From other sources. [For formn. of \bar{C} (together with other products) from 2,5-dichlorobenzoquinone-1,4 (3:4470) or from 2,6-dichlorobenzoquinone-1,4 (3:3750) with boilg. conc. HCl see (14); from C_6H_6 with KClO₃ + H_2SO_4 see (16).]

CHEMICAL BEHAVIOR OF C

Reduction. [\bar{C} with Na/Hg in acid soln. is hardly affected and does *not* (3) give hydro-quinone; however, for anal. of \bar{C} by quant. detn. of chlorine with H₂ at elev. temp. see (10).]

Oxidation. \bar{C} on oxidn., e.g., with CrO₃ at 0° (5), conc. HNO₃ (4) (3), AgNO₃ (4), or FeCl₃ (4), gives 2,3,5-trichlorobenzoquinone-1,4 (3:4672); note, however, that with insufficient oxidizing agent the corresp. quinhydrone (see below) may separate.

[For study of oxidn -reductn. potential of system $\bar{C} + 2,3,5$ -trichlorobenzoquinone-1,4 (3:4672) see (2) (17) (18).]

C (1 mole) with 2,3,5-trichlorobenzoquinone-1,4 (3:4672) (1 mole) in CHCl₃ soln. gives on evapn. (2) (19) the corresp. quinhydrone, green-black cryst., m.p. 114-115° (2), 103° (19).

[Note also that Č in aq. KOH exposed to air first turns green, then red, and finally brown (4), and this soln. on stdg. or boilg. in air gradually separates the corresp. potassium salt of chloranilic acid (3:4970) (3).]

Other reactions of \bar{C} . $[\bar{C}$ with PCl₅ (2 moles) on htg. gives (3) a mixture of pentachlorobenzene (3:2290) and hexachlorobenzene (3:4939).]

- ---- Trichlorohydroquinone dimethyl ether (3,4,5-trichloro-1,4-dimethoxybenzene): unreported.
- Trichlorohydroquinone diethyl ether (3,4,5-trichloro-1,4-diethoxybenzene): ndls. from alc., m.p. 68.5° (3). [From C with C₂H₈I + KOH in s.t. (3).]
- Trichlorohydroquinone diacetate: ndls. by sublimation, m.p. 153° (3). [From C with AcCl under reflux (3).]
- Trichlorohydroquinone dibenzoate: ndls. from CS₂, m.p. 174° (14). [From C̄ with BzCl on htg. (14).]

- 3-Chloro-4-hydroxybenzaldehyde 2,4-dinitrophenylhydrazone: unrecorded.
- 3-Chloro-4-hydroxybenzaldehyde semicarbazone: yel. ndls. from very dil. AcOH, m.p. 210° dec. (1); 212° (3).

3:4065 (1) Biltz, Ber. 37, 4031-4034 (1904). (2) Buehler, Brown, Holbert, Fulmer, Parker, J. Org. Chem. 6, 904 (1941). (3) Hanus, J. prakt. Chem. 158, 263 (1941). (4) Geigy and Co., Ger. 105,798; Cent. 1900, I 523. (5) Haakh, Smola, Austrian 151,159, March 25, 1935; Cent. 1935, I 439.

3:4085 2-CHLORO-3-HYDROXYBENZ- CHO $C_7H_5O_2Cl$ Beil. S.N. 745 ALDEHYDE

M.P. 139.5° (1) 139-139.5° (3) 139° cor. (4)

Colorless cryst. from dil. AcOH (1) becoming pale pink on prolonged exposure to air (1). — Č has pronounced sternutatory props. (1) (3).

[For prepn. of \tilde{C} from m-hydroxybenzaldehyde (1:0055) + Cl_2 (32.6% yield (4)) see (1) (3) (4); for indirect prepn. via 2-nitro-3-hydroxybenzaldehyde, reductn., and appropriate diazo reactns. see (1).]

 \tilde{C} in 50% AcOH mononitrated as directed (2) by grad. addn. of HNO₃ (D=1.3) then after a min. poured onto ice gives 100% yield of mixt. of 4-nitro and 6-nitro derivs.; extraction with aq. at 90° dissolves the latter leaving residue of almost pure 4-nitro deriv.; from the soln. of 6-nitro isomer a little dissolved 4-nitro cpd. is distilled out with steam (2).

4-Nitro-2-chloro-3-hydroxybenzaldehyde: pale yel. ndls. from AcOH, m.p. 166° (2). [Corresp. oxime, insol. aq., yel. ndls. from alc., m.p. 170° (2); p-nitrophenylhydrazone, deep or. ndls. from hot AcOH, m.p. 294-295° dec. (2); semicarbazone, sulfur-yel. ndls.

from hot alc., m.p. 271-272° dec. (2); methyl ether, colorless ndls. from dil. alc. or dil. AcOH, m.p. 107° (2).]

6-Nitro-2-chloro-3-hydroxybenzaldehyde: colorless ndls. from aq., m.p. 153° (2). [Corresp. oxime, exceedingly sol in aq. or alc, colorless ndls. from CHCl₃, m.p. 175° (2); p-nitrophenylhydrazone, or.-red ndls. from hot dil. AcOH, m.p. 232-233° (2); semicarbazone, pale yel. ndls. from alc., m.p. 234° dec. (2); methyl ether, colorless ndls. from AcOH, m.p. 134° (2).]

Č in CHCl₃ treated with Br₂ in CHCl₃ as directed (5) gives (86% yield (5)) 4-bromo-2-chloro-3-hydroxybenzaldehyde, cryst. from 50% AcOH, m.p. 139-140° cor. (5). [This deriv. depresses m.p. of \bar{C} (5).] [4,6-Dibromo-2-chloro-3-hydroxybenzaldehyde has m.p. 104-105° (5).]

C with 50% KOH at 60-70° undergoes Cannizzaro reacting giving (4) 2-chloro-3-hydroxy-benzyl alc. (87% theory (4)), cryst. from toluene, mp. 132° cor (4), and 2-chloro-3-hydroxy-benzoic acid (96% theory (4)) (3:4395), cryst. from aq., mp. 156° (4)

C in aq. 20% NaOH (1) or aq. NaHCO₃ (1), treated with Me₂S()₄, yields methyl ether (2-chloro-3-methoxybenzaldehyde), volatile with steam, cryst. from dil alc., m.p. 56-57° (1). [This ether depresses m.p. of corresp. deriv. (m.p. 52°) of the isomeric 4-chloro-3-hydroxybenzaldehyde (3:3780)] [On oxidn. with alk. KMnO₄ (1) this methyl ether yields 2-chloro-3-methoxybenzoic ac., m.p. 160° (1).]

- **2-Chloro-3-hydroxybenzaldoxime:** colorless ndls from dil alc., m.p. 149° (1).
- ---- 2-Chloro-3-hydroxybenz ldehyde phenylhydrazone: unrecorded.
- **② 2-Chloro-3-hydroxybenzaldehyde** *p*-nitrophenylhydrazone: or -red ndls from hot alc., m.p. 244-245° (1).
- ---- 2-Chloro-3-hydroxybenzaldehyde 2,4-dinitrophenylhydrazone: unrecorded
- **② 2-Chloro-3-hydroxybenzaldehyde semicarbazone:** pale yel ndls, mp. 236-237° (1).
- **D** 2-Chloro-3-acetoxybenzaldehyde: rhombic cryst. from alc., m p. 62° (1).
- © 2-Chloro-3-benzoxybenzaldehyde: rhombic cryst. from alc., m.p. 88° (1).

3:4085 (1) Hodgson, Beard, J. Chem. Soc. 1926, 149-155 (2) Hodgson, Beard, J. Chem. Soc. 1926, 2031-2036. (3) Bissell, Kranz (to National Amline and Chem. Co.), U.S. 1,776,803, Sept. 30, 1930; Cent. 1931, II 159, C.A. 24, 5768-5769 (1930). (4) Lock, Monatsh. 55, 309-311 (1930). (5) Lock, Monatsh. 62, 187-188 (1933).

3:4095 2,4-DICHLOROPHENOXYACETIC $C_8H_6O_3Cl_2$ Beil. S.N. 522 ACID Cl OCH_2COOH

White odorless cryst. from C_6H_6 ; alm. insol. aq. — Neut. Eq. = 221.0.

[For prepn. of \bar{C} from 2,4-dichlorophenol (3:0560) with chloroacetic acid (3:1370) in aq. NaOH (87% yield) see (1).]

[For general survey of \overline{C} as plant hormone see (1) (3) cf. (4); for use of solns. of \overline{C} in polyethylene glycols for regulating growth of plants see (5); for use of \overline{C} as weed killer see (6).]

3:4095 (1) Zimmermann, Ind. Eng. Chem. 35, 596-601 (1943). (2) Pokorny, J. Am. Chem. Soc. 63, 1768 (1941). (3) Zimmermann, Hitchcock, Contrib. 3:4102 m-CHLOROPHENYLPROPIOLIC C₉H₅O₂Cl Beil. S.N. 950 ACID ——C=C—COOH

M.P. 140-141° (1)

Cryst. from AcOH.

[For prepn. of \bar{C} from *m*-chlorobenzaldehyde (3:6475) by conversion through *m*-chlorocinnamic acid to ethyl *m*-chlorocinnamate, thence by addn. of Br₂ to give ethyl β -(*m*-chlorophenyl)- α , β -dibromopropionate, followed by climination of 2 HBr and saponification (or vice versa) with alc. KOH, and final acidification (yield not stated), see {1}.

Č with Cu(OAc)₂ loses CO₂ yielding (1) *m*-chlorophenylacetylene (3:9500) (cf. also under o-chlorophenylpropiolic acid (3:3956)).

3:4102 (1) Otto, J. Am. Chem. Soc. 56, 1393-1394 (1934).

Ndls. from ether; cryst. from CCl₄, CS₂, C₆H₆ + EtOH, or C₆H₆ (for studies on crystal-lographic props. see (2) (8) (5) (15)). — Insol. cold and spar. sol. hot alc.; fairly sol. cold ether, C₆H₆, CHCl₃, or CS₂. — \bar{C} has penetrating and disagreeable odor. — Sublimes easily.

[For prepn. of \bar{C} from 2,4,5-trichloroaniline [Beil. XII-627] (9) or from 2,5-dichloro-p-phenylenediamme [Beil. XIII-118] (16) via diazotization and use of Cu_2Cl_2 reactn. (64% yield (16)) see indic. refs; from p-dichlorobenzene (3:0980) with $S_2Cl_2 + AlCl_3$ in SO_2Cl_2 (67% yield (1)) (17) or from o-dichlorobenzene (3:6055) with $Cl_2 + cat$. (18) see indic. refs.]

[For formn. of \bar{C} from C_6H_6 with Cl_2 in pres. of I_2 (5), Fe (44% yield (13)), or AlCl₃ (19), or Cu (20), or from chlorobenzene with $Cl_2 + Cu$ (20), or from c-dichlorobenzene (3:6055) with $Cl_2 + cat$. (18) or Al/Hg (21), or from m-dichlorobenzene (3:5960) with $Cl_2 + L$ (21) or AlCl₃ (4), or from p-dichlorobenzene with Cl_2 in pres. of Fe (39% yield (13)), see indic. refs.; from dry C_6H_6 with anhyd. AuCl₃ (22) or on electrol. in aq. HCl/AcOH soln. see (23); from lower chloro derivs. of C_6H_6 with FeCl₃ see (7); from 2,4,5-trichlorotoluene (3:2100) with Cl_2 see (24); from benzaldehyde (1:0195) by htg. with $SbCl_5$ see (11).]

[For form. of \tilde{C} from 2,5-dichloro-4-nitroaniline on diazotization and treatment with Cu_2Cl_2 see (25) (14) (note abnormal replacement of nitro group); from nitrobenzene with $SO_2Cl_2 + N_2O_4$ see (10); from resorcinol 4,6-bis-(sulfonyl chloride) or hydroquinone 2,5-

bis-(sulfonyl chloride) with PCl₅ in s.t. at 180° see {12} (26); from 4,6-dichlorobenzene 1,3-bis-(sulfonyl chloride) (27) or from 1,3-bis-(methylmercapto)benzene-4,6-bis-(sulfonyl chloride) (28) with SOCl₂ at 170-200° see indic. refs.; from 2,5-dichlorobenzene-1,4-bis-(sulfonyl chloride) with PCl₅ in s.t. 4 hrs. at 180° see (6); from 2,3,5,6-tetrachloro-N-nitroacetanilide (39) by refluxing in toluene or xylene (other products are also formed) see (39).]

[For behavior of \bar{C} with liq. Cl₂ yielding addn. products see (29); for behavior with NH₃ at elevated temps, see (30); \bar{C} with $S_2Cl_2 + AlCl_3 + SO_2Cl_2$ yields (17) hexachlorobenzene (3:493)).]

[C htd. with NaOMe as directed yields according to conditions (13) (31) (32) (38) 2,4,5-trichlorophenol (3:1620) or its methyl ether.]

 \overline{C} on mononitration, e.g., on boilg. with 5 pts. HNO₃ (D=1.52) for $\frac{1}{2}$ hr. (3) (13) (34), yields 1,2,4,5-tetrachloro-3-nitrobenzene [Beil. V-247], m.p. 99-100° (33) (35), 99° (34) (13), 98° (9), some tetrachlorobenzoquinone (chloranil) (3:4978) (insol. in pet. ether) also being formed (9) (34) (13) (33). [For studies on chem. of this mononitro cpd. see (36).]

 $\tilde{\mathbf{C}}$ on dinitration by boilg. 5-6 hrs. with mixt. of 10 pts. HNO₃ (D=1.52)+10 pts. fumg. H₂SO₄ (25% SO₃) gives (71% yield (33)) 1,2,4,5-tetrachloro-3,6-dinitrobenzene, cryst. from C₆H₆ by addn. of alc., m.p. 227-228° (33), 232-233° (35).

Č with 4 pts. chlorosulfone acid refluxed for hr. gives (78% yield (37)) hexachlorobenzene (3:4939), m.p. 218-219° u.c. (37).

3:4135 TETRACHLORORESORCINOL

M.P. 141° (1) 140° (2) Long colorless ndls. from hot aq. — Faintly pleasant phenolic odor. [New comml. prod. (1942) in U.S.A.] — Eas. sol. alc., ether, AcOH, C₆H₆; fairly eas. sol. hot aq.; spar. sol. cold aq.

[For prepn. from "hexachlororesorcinol" (3:3470) by reduction with SnCl₂ in AcOH see (1).]

C is sol. in aq. alk. (2). — C in aq. soln. gives with FeCl₃ a blue color (2).

C in AcOH on treatment with Cl2 yields "hexachlororesorcinol" (3:3470), m.p. 115°.

Tetrachlororesorcinol diacetate: m.p. 145° (1), 144° (2). [Note that m.p. of this deriv. is close to that of C and should be tested by method of mixed m.p.'s.]

3:4135 (1) Zincke, Fuchs, Ber. 25, 2689-2690 (1892). (2) Fries, Hartmann, Ber. 54, 199 (1921).

3:4140 2,4-DICHLORO-3-HYDROXYBENZ-ALDEHYDE

M.P. 141° (1)

Colorless cryst. from AcOH. \bar{C} has pronounced sternutatory props. and blisters moist skin. — [Note that the m.p. of a mixt. of \bar{C} with isomeric 2,6-dichloro-3-hydroxybenz-aldehyde (3:4160), m.p. 140°, is depressed to 111° (1)]

[For prepn. of C from 4-chloro-3-hydroxybenzaldehyde (3.3780) in AcOH with Cl₂ at room temp. (100% yield) see (1).]

 \tilde{C} (1 pt.) in AcOH (4 pts.) on nitration at 65° with 1 pt. conc. HNO₃ (D=1.42) yields (2) 2,4-dichloro-3-hydroxy-6-nitrobenzaldehyde (2), colorless ndls. from its deep yellow soln. in AcOH or from hot aq., m.p. 107° (2) (p-nitrophenylhydrazone, or. ndls. from AcOH, m.p. 279-280° (2), semicarbazone monohydrate, yel. ndls. from dil. alc., softens 140-150° (2)).

Č dislvd. in boilg. 10% NaOH (2 moles) and treated with Me₂SO₄ (1.3 moles) yields (1) 2,4-dichloro-3-methoxybenzaldehyde, m.p. 82° (1) (p-nitrophenylhydrazone, old-gold ndls., m.p. 258-260° (1)), which on oxidn. yields 2,4-dichloro-3 methoxybenzoic acid, colorless ndls., m.p. 163° (1).

- © 2,4-Dichloro-3-hydroxybenzaldoxime: fine colorless ndls. from alc., m.p. 188° (1).
- **② 2,4-Dichloro-3-hydroxybenzaldehyde** *p*-nitrophenylhydrazone: or.-red ndls., m.p. 277-278° dec. (1).

3:4140 (1) Hodgson, Beard, J. Chem. Soc. 1926, 147-155. (2) Hodgson, Beard, J. Chem. Soc. 1926, 2030-2036.

C7H5O2Cl 3:4150 o-CHLOROBENZOIC ACID Beil. IX - 334 COOH IX_{1} -(138) M.P. 142° (1) (2) (3)139.9° (15)139.8-140.0° (16)141.8° (4) 139.5-140° 141° (5) (6) (7) (8) (181) (17)140-142° (9) 139.5° (38) 139-140° 140.65° (10)(18) (19)139° 140.3° (11) (29)(20) (21) (22) 138° 140.2° (23) (24) (58) $\langle 12 \rangle$ 140° 137° (13) (14) (26) (27) (49) (25) (63) (97) (36)

Cryst. from hot aq., C_6H_6 , dioxane/ C_6H_6 , or alc. — \bar{C} is spar. sol. cold aq.; e.g., \bar{C} is sol. at 0° in 881 pts. aq. (27); at 25°, 100 ml. satd. aq. soln. conts. 0.213 g \bar{C} (21) (= 0.0136 mole per liter (21) (28)) — \bar{C} is eas. sol. hot aq, alc., ether (26) — At 14–16°C 100 ml. satd. soln. of \bar{C} in acetone conts. 28.4 g. \bar{C} , in ether 17 g. \bar{C} , in EtOAc 13.2 g. \bar{C} , in 75% AcOH 6.2 g. \bar{C} ; in C_6H_6 0.9 g. \bar{C} ; in CCl_4 0.6 g. \bar{C} ; in CS_2 0.5 g. \bar{C} ; in lgr. 0.07 g. \bar{C} (10). — For study of soly. of \bar{C} in acetone (41), C_6H_6 (42), heptane (29), chlorobenzene (3: 7903) (30), o-chlorotoluene (3: 8245) (30), or m-chlorotoluene (3. 8275) (30) see indic. refs.

For study of distribution at 25° of \bar{C} between aq. + toluene (31), aq. + xylene (32), or aq. + CHCl₃ (31) (32) (for use of CHCl₃ in sepn. of \bar{C} from aq. suspension of 3-chlorophthalic acid (3:4820) (33)) see indic. refs.; for adsorption of \bar{C} on charcoal from its solns. in EtOH (34), acetone (4), C_6H_6 (4), or aq. (35) see indic. refs.; for soly. of \bar{C} in aq. solns. of various salts (including Na \bar{A}) see (28) (21).

 \bar{C} can be sublimed in vac. (12). — \bar{C} is but very slightly volatile with steam (for details see (11)). — For crystallographic data see (36) (37). — For purification of \bar{C} (by use of decolorizing carbon on soln. of \bar{C} in aq. Na₂CO₃ followed by repptn. with 6 N HCl) see (38).

Binary systems contg. \bar{C} : for f.p./compn. data on system $\bar{C} + H_2O$ see (39); for f.p./compn. data and diagram on system $\bar{C} + BzOH$ (1:0715), euteetic, m.p. 91.1°, contg. about 41 wt. % \bar{C} , see (10) (41); for f.p./compn. data on systems $\bar{C} + o$ -toluic acid (1:0690) (20) or $\bar{C} + o$ -hydroxybenzoic acid (salicylic acid) (1:0780) (20) see indic. refs.

For f.p./compn. data and diagrams on systems \bar{C} + m-chlorobenzoic acid (3:4392) (eutectic, m.p. 110.7°, contg. 52-53 mole % \bar{C} (6) (40) (10) (15)) see indic. refs ; on system \bar{C} + p-chlorobenzoic acid (3:4940) (eutectic, m.p. 132°, contg. abt. 86 mole % \bar{C}) see (10) (15).

For f.p./compn. data and diagrams on systems $\tilde{C}+o$ -bromobenzoic acid (41), $\tilde{C}+o$ -iodobenzoic acid (42), $\tilde{C}+o$ -nitrobenzoic acid (43), $\tilde{C}+m$ -nitrobenzoic acid (43) see indic. refs.

Ternary systems contg. $\bar{\mathbf{C}}$. [For influence of addn. of benzoic acid (6) or of p-chlorobenzoic acid (3:4940) (40) to the eutectic of $\bar{\mathbf{C}}$ with m-chlorobenzoic acid (3:4392) see indic. refs.; for influence of addn. of $\bar{\mathbf{C}}$ to the eutectic of benzoic acid with m-chlorobenzoic acid see (40); for data on system $\bar{\mathbf{C}} + m$ -chlorobenzoic acid (3:4392) + p-chlorobenzoic acid (3:4940), eutectic, m.p. 104.9°, contg. respectively 48.3, 44.0, and 7.7 mole % of the three isomers, see (15).]

Miscellaneous. [For study of fate of \tilde{C} in animal organism see (44) (45); note that contrary to earlier (45) results with dogs and rabbits conjugation with glycine to yield the expected N-(o-chlorobenzoyl)glycine (o-chlorobippuric acid) [Beil. IX-336], m.p. 176° (45), does (44) occur. — For study of use of \tilde{C} (or its salts) as preservatives see (46); for detectn. of \tilde{C} in foods see (179). — For use of \tilde{C} as vulcanization regulator see (47) (48).]

Preparation. [For prepn. of \bar{C} from o-chlorotoluene (3:8245) by oxidn. with boilg aq. KMnO₄ (yields: 90% (14), 74–78% (18), 68–71% (24)) (49) (13), with nitrosulfonic acid (from fumg. HNO₃ + dry SO₂) at 100° (50), with air in the pres. of various catalysts (51) (52) (53), or in aq. alk. at 260° under press. (54), see indic. refs; for formn. of \bar{C} from o-chlorophenyl benzyl ketone by auto-oxidn. in light and air see (56); for formn. of \bar{C} from o-chlorobenzaldehyde (3:6410) by oxidn. with CrO₃ (57), with alk. KMnO₄ (58), or by auto-oxidn. in Ac₂O (59) see indic. refs.]

[For prepn. of \bar{C} from o-aminobenzoic acid (anthranilic acid) [Beil. XIV-312, XIV₁-(529)] via diazotization and use of Cu₂Cl₂ (yields: 90% (24), 87% (178)) (preferably under CO₂ (60)), or CuH (60% yield (61)), or Cu (62) see indic. refs.]

[For prepn. of \bar{C} from o-chlorobenzonitrile [Beil. IX-336] by hydrolysis with H₂SO₄ (14), with dil. HCl in s.t. at 150° (63), or boilg. KOH (14) see indic. refs.; from o-chlorobenzoyl chloride (3:6640) by hydrolysis with aq. (91) or aq. alk.; from o-chlorobenzotri-

chloride (3:6880) by hydrolysis (64) (65), e.g., with aq. in s.t. at 150° (27) or by boilg. conc. HNO₃ (65) see indic. refs.; from o-chlorobenzal (di)chloride (3:6625) with CrO₃ (57) or with boilg. aq. for 20 hrs. followed by oxidn. with KMnO₄ (75% yield (7)); from a mixt. of o-chlorobenzotrichloride + o-chlorobenzal (di)chloride by hydrol. with 70% H₂SO₄ or 80% AcOH or 5% NaOH at 90-100° in stream of air to effect immediate oxidn. (67); from o-chlorobenzoyl-o-chlorotriphenylmethane by hydrolytic cleavage with 20% MeOH/KOH 5 hrs. at b p. (8); from o-chlorophenylnitrolic acid by hydrolysis with boilg. aq. (19) see indic. refs.]

[For form. of \bar{C} (together with other prods.) from benzoic acid (1:0715) with KClO₃ + HCl (68), with NaOCl (6) (69), see indic refs.]

[For formn. of \bar{C} from o-sulfobenzoic acid imide (saccharin) [Beil. XXVII-168, XXVII₁-(266)] with KClO₃ + HCl see (9); from 3-chlorophthalic acid (3:4820) by cat. monode-carboxylation see (70); from o-nitrotoluene [Beil. V-318, V₁-(158), V₂-(243)] (71), from sodium o-toluenesulfonate [Beil. XI-83, XI₁-(22)] (72), or from o-toluenesulfonyl chloride [Beil. XI-86, XI₁-(23)] (71) with SOCl₂ in s.t. at elevated temp. followed by treatment with aq. see indic refs.]

Chemical behavior. [\bar{C} (as Na \bar{A}) on reduction with Na/Hg (27) (25) (73) or \bar{C} (as K \bar{A}) on fusion with sodium formate (74) of (75) is dehalogenated yielding benzoic acid (1:0715) (for study of reduction of \bar{C} with H₂ + Ni in aq. alk at ord. temp. see (76)). — \bar{C} on electrolytic reduction in alc. H₂SO₄ yields (77) o-chlorobenzyl alc. [Beil. VI-444, VI₁-(222)], ndls. from aq. alc., m p. 72° (77)]

 \bar{C} behaves normally as a monobasic acid: e.g., \bar{C} on titration with standard dil. aq. alk. gives Neut. Eq. 156.5; ionization const at 25° is 13.2×10^{-4} (78) (79) cf. (80) (81) (21) (1). — [For study of acid strength of \bar{C} in various alcohols (82) (83) (84) (5) (85) (86) (22) or in acctonitrile (87) see indic. refs. — For solubility of \bar{C} in aq. solns. of various salts incl. Na \bar{A} see (28) (21). — For sepn. of \bar{C} from p-chlorobenzoic acid (3:4940) by use of difference in their acidic strength see (88). — For use of \bar{C} as standard in alkalimetry (89) and in iodimetry (90) see indic refs]

Salts of inorg. bases. [NH₄ $\bar{\Lambda}$ (91) (92) (note that this salt with benzotrichloride (3:6880) in pres. of suitable cat. yields (93) o-chlorobenzontrile). — Hydroxylamine salt: m.p. 104.5° (94). — Na $\bar{\Lambda}$ (use as preservative) (46) — K $\bar{\Lambda}$.½H₂O (91) (forms liq. cryst. on fusion (95)). — Ag $\bar{\Lambda}$, scales from boilg aq. (25) (100) (note that this salt with I₂ in C₆H₆ under reflux does not (96) yield phenyl o-chlorobenzoate, m.p. 37°, and thus differs from corresp. salt of m-chlorobenzoic acid (3:4392)). — Ca $\bar{\Lambda}_2$.H₂O (26) (97), much more sol. aq. than corresp. salts of m-chlorobenzoic acid (3:4392) or p-chlorobenzoic acid (3:4940) (97); insol. either cold or hot alc. (98); on dry distn. gives (18% yield (99)) xanthone (1:7275), m p. 174°. — Ba $\bar{\Lambda}_2$.3H₂O from spont evapn. of aq. soln. (98) (9). — Ba $\bar{\Lambda}_2$ from hot conc. aq. soln. (25) (26) (use in sepn. of \bar{C} from isomers (40)); spar. sol. aq. (100). — Note that Pb $\bar{\Lambda}_2$ (25) (100) and Cu $\bar{\Lambda}_2$ (25) (100) are spar. sol. aq., while salts of Ca, Sr, Mg, Zn, Fe, Mn, Co, Ni, and Cd are sol (100). — For sepn. of \bar{C} from BzOH (1:0715) by use of Cu salts see (6).]

Salts of organic bases. \bar{C} with equiv. amt. benzylamine in boilg. EtOAc followed by evapn. of solvent yields (101) benzylammonium o-chlorobenzoate, m.p. 148.4–149.4° u.c., 150.5–151.5° cor, Neut Eq. 263.6 (note that the m.p. of this salt is but very slightly differom that of corresp. salt of m-chlorobenzoic acid (3:4392)). — \bar{C} similarly treated with α -phenylethylamine yields (101) α -phenylethylammonium o-chlorobenzoate, m.p. 128.4–129.4° u.c., 130.9–131.9° cor., Neut. Eq. 277.6 (note that m.p. of this salt, although better separated from those of the isomeric acids than the preceding case, is very close to those of the corresp. salts of m-methoxybenzoic acid, p-methoxybenzoic acid, and o-nitrobenzoic acid).

Č (1 mole) in alc. mixed with codeine (1 mole), m.p. 155°, htd. several minutes, solvent evapd. and resulting sirup recrystd. from aq. yields (102) codeine o-chlorobenzoate, C₁₈H₂₁-O₃N.Č, m.p. 134° on "Maquenne block"; note that this value although close to that of corresp. prod. from o-bromobenzoic acid is widely different from that of corresp. salts of either m-chlorobenzoic acid (3:4392) or p-chlorobenzoic acid (3:4940) which are 96° and 162° respectively. — Č (1 mole) in alc. (or CHCl₃) with strychnine (1 mole) in alc., boiled for a few minutes, then cooled, yields (103) strychnine o-chlorobenzoate, C₂₁H₂₂-O₂N₂.Č, m.p. 170° u.c. on "Maquenne block"; note that this melting point is somewhat lower than that (185°) for the corresp. salt of m-chlorobenzoic acid (3:4392) and widely different from that (251°) of the corresp. salt of p-chlorobenzoic acid (3:4940).

[For optical data on cinchonine salt see (104); for salt (m.p. 108-110°) with phenylmercuric hydroxide see (105).]

 \tilde{C} with alcohols gives by conventional processes the corresp. esters; for details on methyl o-chlorobenzoate (3:6695) and ethyl o-chlorobenzoate (3:6800) see these compds. — [For study of rate of esterification of \tilde{C} with MeOH (106) (111) (17) (112), with EtOH (2) (17) (113), or with cyclohexanol (1:6415) (107) see indic. refs.]

 \bar{C} with P_2O_5 in toluene boiled for 4 hrs. (108), or \bar{C} (109) or its sodium salt (110) refluxed with oxalyl (di)chloride (3:5060) in C_6H_6 , yields o-chlorobenzoic acid anhydride, ndls. from lt. pet. (108) or alc. (109), m.p. 79.6° (108), 78-79° (109); note that \bar{C} (2 moles) with oxalyl (di)bromide refluxed in C_6H_6 similarly gives good yields (110) of the above anhydride, but that Na \bar{A} with oxalyl (di)bromide can also be used (110) to give o-chlorobenzoyl bromide, b.p. 143-145° at 37 mm. (110).

 \tilde{C} with PCl₅ (114) (45) (115), or with PCl₃ + ZnCl₂ (114), or with SOCl₂ (114) (45) (116) (117), or with SOCl₂ + pyridine (118), or with o-chlorobenzotrichloride (3:6880) + ZnCl₂ (119) yields o-chlorobenzoyl chloride (3:6640) q v. for data on yields.

Č with KOH or NaOH on fusion (128) (27) (25), or Č with aq. piperidine in pres. of Cu powder in s.t. at 160° for 4 hrs. (121), or Č with aq. piperidine + Na₂CO₃ + amyl alc. + Cu powder refluxed 6 hrs. (124), or Č (as KĀ) with aq. NaOAc + Cu(OAc)₂ in s.t. at 140–150° for 9–10 hrs. (126), or Č with aq. Ca(OH)₂ + Cu cpds. at 160–170° under press. (122) gives (83% yield (126)) o-hydroxybenzoic acid (salicylic acid) (1:0780), accompanied in some cases (120) by substantial amounts of m-hydroxybenzoic acid (1:0825). — For use of alk. fusion as means of detect. of Č in wine see (123). — Note that Č with aq. KOH (even in pres. of copper) (124), or Č with aq. Ba(OH)₂ in s.t. at 190–200° (125), does not yield salicylic acid or any chloride ion.

Reaction of C with phenols. C on suitable treatment condenses with phenols yielding σ-aryloxybenzoic acids: e.g., C (as KĀ) with Na phenolate and Cu powder at 180–190° for 5 min. (127) (128), or C (as KĀ) with phenol + Cu powder or Cu salts (129) (130), or C (as KĀ) with anhydrous KOAc/NaOAc + Cu powder at 245–255° for 5 hrs. (126) gives (90% yield (127)) σ-phenoxybenzoic acid [Beil. X-65, X₁-(28)], lfts. from dil. alc., m.p. 113°; note that this prod. with conc. H₂SO₄ on gentle warming loses H₂O and ringcloses in quant. yield (131) to xanthone (1:7275), m.p. 174°. — [For analogous condensations of C with σ-cresol (1:1400) (127) (128) (60), m-cresol (1:1730) (127), p-cresol (1:1410) (127) (128), σ-anphthol (1:1500) (132), β-naphthol (1:1540) (127) (128), σ-chlorophenol (3:0495) (133), m-chlorophenol (3:0495) (133), m-nitrophenol (133), p-nitrophenol (133), including conv. to the corresp. xanthones, see indic. refs.; many other analogous cases are known but cannot be included here.

Reaction of C with amines. C (or its salts) with primary or secondary aliphatic or aromatic amines in the pres. of K₂CO₃ and Cu powder on htg. condenses with elimination of HCl (or its equivalent) to yield products of type o-HOOC—C₅H₄—NHR; these products by ring closure through elimination of water yield in turn the corresponding acridones; the

reaction has been executed for countless cases of which only a few of the more important examples can be cited here; for the most comprehensive single survey see (134).

 \tilde{C} (as KĀ) htd. with aq. aniline + Cu powder (134) (135), Cu salts (135), or \tilde{C} htd. with aniline + Cu powder (136) or Cr powder (137), or \tilde{C} htd. with aniline + anhydrous K_2CO_3 + CuO (134) (38) gives (yields: 97% (134), 82–93% (38), 87% (137)) N-phenylanthranilic acid (diphenylamine-o-carboxylic acid) [Beil. XIV-327, XIV₁-(533)], cryst. from alc., m.p. 182–183° rap. htg. (38); this prod. with conc. H_2SO_4 at 100° loses aq. and ring-closes (yields: 91–96% (38)) (138) (139) to acridone [Beil. XXI-335, XXI₁-(312)], sublimable yel. ndls., m p. 354° cor.

[For details on analogous reaction of C with o-toluidine (134) (135) (136) (140), m-toluidine (134) (141), p-toluidine (134) (135), α-naphthylamine (134) (135), ρ-naphthylamine (134) (135), o-aminophenol (134), o-anisidine (134), m-anisidine (134), p-anisidine (134), p-aminobenzoic acid (134), p-phenylenediamine (134), p-aminodimethylaniline (124), see indic. refs.; scores of other examples cannot be cited here.]

Substitution of nucleus of \bar{C} . — [\bar{C} in fumg. H_2SO_4 or chlorosulfonic acid + a little sulfur treated with Br_2 (1 mole) at $60-70^\circ$ gives (70-75% yield (143)) 5-bromo-2-chlorobenzoic acid [Beil. IX-355], ndls., m.p. 165-167° (143).]

 \bar{C} on mononitration under various conditions, e.g., \bar{C} (2 wt. pts.) dislvd. in conc. H₂SO₄ (15 wt. pts.) and treated below 50° with a mixt. of HNO₃ (D=1.5) (1 wt. pt.) in conc. H₂SO₄ (2.5 wt pts.) (144) gives mainly (yields: 78.5% (144), 35% (145), 32–38% (146)) (147) (148) (14) (149) 2-chloro-5-nitrobenzoic acid [Beil. IX-403], ndls. from aq., m.p. 165° (149) (14) (172), 164–165° (144) (145), 164° (146) (148), accompanied by a small amt. 2-chloro-3-nitrobenzoic acid [Beil. IX-402], m.p. 185° (148), 181° (150). — [Note that both the other nitro-2-chlorobenzoic acids are known, viz., 2-chloro-4-nitrobenzoic acid [Beil. IX-404], ndls. from aq., m.p. 140° (151), 139–140° (152), and 2-chloro-6-nitrobenzoic acid, m.p. 161° (151), but are prepd. by other methods.]

Č on direct dinitration, e.g., with conc. H₂SO₄ + KNO₃ at 100° (153) (154) or at 130° (155) or Č with conc. H₂SO₄ + fumg. HNO₃ at 130–140° (156), gives (94% yield (155)) 2-chloro-3,5-dinitrobenzoic acid [Beil. IX-415], ndls. from aq., m.p. 199–200° (153) (154), 199° (156), 198.5° cor. (155) (for use of this prod. in detection of Č see (180)); this prod. is also obtd. by further nitration of 2-chloro-3-nitrobenzoic acid (above) with conc. H₂SO₄ + KNO₃ at 170° (157). — [Note that of the 5 other isomeric dinitro-2-chlorobenzoic acids which are possible only one is known, viz, 2-chloro-4,5-dinitrobenzoic acid, m.p. 165° cor. (158), obtd. from 2-chloro-4-nitrobenzoic acid (above) by further nitration with fumg. HNO₃ + conc. H₂SO₄ (80% yield (158)).]

- --- Methyl o-chlorobenzoate: oil, b.p. 234°. (See 3:6695.)
- --- Ethyl o-chlorobenzoate: oil, b.p. 243°. (See 3:6800.)
- p-Nitrobenzyl o-chlorobenzoate: m.p. 106° (159). [From C (as NaA) with p-nitrobenzyl bromide (m.p. 99°) in boilg. dil. alc. (159); note that the m.p. of this ester is almost identical with that (107°) of the corresp. prod. from m-chlorobenzoic acid (3:4392).]
- Dependent of this prod. is only slightly lower than that (87.6°) of the corresp. prod. similarly obtd. from p-chlorobenzoic acid (3:4940).
- --- p-Chlorophenacyl o-chlorobenzoate: unreported.
- p-Bromophenacyl o-chlorobenzoate: m.p. 107.0° cor. (161), 106° (23) (162). [From C (as NaA) with p-bromophenacyl bromide (m.p. 109°) in boilg. alc. (80% yield (23)).]

- ---- p-Iodophenacyl o-chlorobenzoate: unreported.
- p-Phenylphenacyl o-chlorobenzoate: m.p. 123° (163). [From C (as NaA) with p-phenylphenacyl bromide (m p. 126°) in boilg. alc. (163).]
- --- S-Benzylthiuronium o-chlorobenzoate: unreported.
- © S-(p-Chlorobenzyl)thiuronium o-chlorobenzoate: cryst. from dioxane, m.p. 159° cor. (164). [From \tilde{C} (as Na \tilde{A} or K \tilde{A}) in aq. with 1 equiv of S-(p-chlorobenzyl)-thiuronium chloride, m.p. 197° (10% in alc.) (164); note that the m.p. of this prod. is closely adjacent to that (m.p. 157° cor.) of the corresp. salt of m-chlorobenzoic acid (3:4392).]
- ⑤ S-(p-Bromobenzyl)thiuronium o-chlorobenzoate: m.p. 168° cor. (165). [From Č (as KĀ or NaĀ) in aq. with 1 equiv. of S-(p-bromobenzyl)thiuronium bromide (m.p. 213°) in alc. (165); note that m.p. of this prod. is only slightly higher than that (163° cor.) for the corresp. prod. from p-chlorobenzoic acid (3:4940).]
- © o-Chlorobenzamide: cryst. from alc. or alc./ether, mp. 142.4° cor. (166), 142° (167), 141° (14), 140.5° (91), 139° (25). [From Č by refluxing with \$\text{AcOH}\$ + (\$\text{NH}_4\$)2CO₃ (37-39% yield (167)), from o-chlorobenzoyl chloride (3:6640) with conc. aq. \$\text{NH}_4\$OH (166) (14) (91) (25), or from ethyl o-chlorobenzoate (3:6800) with conc. aq. \$\text{NH}_4\$OH (25).] [Note that o-chlorobenzamide on htg. with \$\text{AlCl}_3\$.NaCl (large excess) gives (93% yield (168)) o-chlorobenzonitrile [Beil. IX-336], m.p. 43-44° (168), 42-43° (169), b.p. 232° (169).]
- © o-Chlorobenzhydrazide: ndls. from alc., m p. 117 118° (170), 109-110° (171). [From ethyl o-chlorobenzoate (3:6800) q.v. with hydrazine hydrate (170) (171); for use as reagt. for identification of aldehydes and ketones see (170).]
- ---- N-(o-Chlorobenzoyl) N-phenylhydrazide: unreported.
- © o-Chlorobenzanilide: ndls. from alc. or pet. ether; mp. 114° (172) (173) (174), 117-118° (175) (176). [From o-chlorobenzoyl chloride (3:6640) with excess aniline (25) (172) in pres. of a tertiary amine (80% yield (174)); also from oxime of o-chlorobenzophenone (3:0715) by Beckmann rearr. (175) (173) (176)] [Note that this prod. must not be confused with benz-o-chloroanilide, m.p. 99-100°.]
- © o-Chlorobenz-p-toluidide: cryst. from dil alc., m.p. 131° (177). [From o-chlorobenzoyl chloride (3:6640) with p-toluidine (177).]
- o-Chlorobenz-α-naphthalide: unreported.
- ---- o-Chlorobenz-β-naphthalide: unreported.
- 3:4150 (1) Dippy, Williams, Lewis, J. Chem. Soc. 1935, 343-346. (2) Kailan, Antropp, Monalsh. 52, 297, 303-307 (1929). (3) Fels, Z. Krist. 37, 485 (1903). 3:4155 5,8-DICHLORONAPHTHOL-2

$$ho$$
OH ho Cl_0H $_6$ OCl2 Beil. S.N. 538

376

M.P. 141-142° (1)

[For prepn. from 5,8-dichloro-2-aminonaphthalene by htg. with dil. H₂SO₄ for 8 hrs. at 195-205° under pressure see (1) (2).]

--- 5,8-Dichloro-2-naphthyl methyl ether: m.p. 74° (2).

3:4155 (1) Soc. Chem. Ind., Basel, Swiss 202,854, May 1, 1939; Cent. 1939, II 3196. (2) Goldstein. Viaud, Helv. Chim. Acta, 27, 883-888 (1944); C.A. 39, 926 (1945).

3:4160 2,6-DICHLORO-3-HYDROXYBENZ-ALDEHYDE

CHO C₇H₄O₂Cl₂ Beil. S.N. 74.5 Cl Cl OH

M.P. 142-142.2° (1) 140.5° cor. (2) (3) 140° (4)

Colorless cryst. from hot aq. — \bar{C} has pronounced sternutatory properties and also attacks moist skin producing painful blisters. — [\bar{C} when mixed with 2-chloro-3-hydroxy-benzaldehyde (3:4085), m.p. 139.5° (4), depresses m.p. to 116° (4).]

[For prepn. of \bar{C} from m-hydroxybenzaldehyde (1:0055) with Cl_2 (2 moles) in AcOH soln. (yields: 51.5% (2) cf. (3), 38% (4)) (1) (other prods. also being formed) see indic. refs.; from 2-chloro-3-hydroxybenzaldehyde (3:4085) with Cl_2 (1 mole) in AcOH see (4); from 6-chloro-3-hydroxybenzaldehyde (3:3350) with Cl_2 (1 mole) in AcOH (\bar{C} is main prod. (5) but 4,6-dichloro-3-hydroxybenzaldehyde (3:3952) is also formed (4) (5)) see indic. refs.]

[For condens. of \bar{C} with p-chlorophenol (3:0475) and use of prod. as mothproofing agent see (6); for condens. of \bar{C} with 2,4-dihydroxybenzoic acid (1:0843) (7) or with o-cresotinic acid (2-hydroxy-3-methylbenzoic acid) (8) and use of products as dye intermediates see indic. refs]

C in 50% aq. KOH at 60-70° first ppts. yel. K salt of C which grad. dissolves and is replaced by a colorless cryst. ppt.; after stdg. 4 hrs. acidification with dil. H₂SO₄ gives (93.8% yield (2)) 2,4-dichlorophenol (3:0560), m.p. 42° (2).

 \bar{C} in AcOH with Br₂ gives (70% yield (3)) 4-bromo-2,6-dichloro-3-hydroxybenzaldehyde, cryst. from C_6H_7 + lgr., m p. 104-105° (3) (methyl ether, m.p. 82°, oxime, m.p. 193° cor. (3)).

 $\bar{\rm C}$ (1 pt.) in AcOH (4 pts.) on nitration with 1 pt. conc. HNO₃ (D=1.42) at 65° yields (4) 2,6-dichloro-3-hydroxy-4-nitrobenzaldehyde, bright yel. ndls. from AcOH or pl. from aq, m.p. 80° (4) (Ag salt, crimson ndls. from hot aq.; oxime, deep yel. ndls. from dil. alc., m.p. 195°; p-nitrophenylhydrazone, deep red ndls. from hot AcOH, m.p. 279-280° dec.; semicarbazone, light-yel. lfts. from hot alc., m.p. 255-256° (4)).

C dislvd. in hot aq. NaHCO₃ and treated with Me₂SO₄ for 15 min. yields (4) (3) the corresp. methyl ether, viz., 2,6-dichloro-3-methoxybenzaldehyde, m.p. 103-104° (3), 102° (4) (p-nitrophenylhydrazone, old-gold ndls., m.p. 214-215° (4)); this methyl ether upon oxidn. with alk. KMnO₄ gives (4) 2,6-dichloro-3-methoxybenzoic acid, ndls. from dil. alc., m.p. 149.5° (4).

- ② 2,6-Dichloro-3-hydroxybenzaldoxime: ndls. from dil. alc., m.p. 174-175° (4).
- D 2,6-Dichloro-3-hydroxybenzaldehyde p-nitrophenylhydrazone: deep or.-red. ndls.,
 m.p. 205-206° (4).

3:4160 (1) Bissell, Kranz (to National Aniline and Chem. Co.), U.S. 1,776,803, Sept. 30, 1930; Cent. 1931, I 159; C.A. 24, 5768-5769 (1930). (2) Lock, Monath. 55, 311 (1930). (3) Lock, Monath. 662, 184-185, 193-194 (1933). (4) Hodgson, Beard, J. Chem. Soc. 1926, 148-149, 152-153, 155. (5) Hodgson, Beard, J. Chem. Soc. 1926, 2031, 2034-2035. (6) Weiler, Wenk, Stötter (to I.G.), Ger. 530,219, July 24, 1931; Cent. 1932, I 3012. (7) Weiler (to F. Bayer & Co.), U.S. 1,532,790, April 7, 1925; Cent. 1925, II 352. (8) I.G., Brit. 263,879, March 2, 1927; Cent. 1927, I 2364.

3:4170 3-CHLORONAPHTHOL-1

$$\begin{array}{c|c} OH & C_{10}H_7OCl & \textbf{Beil. VI } --\\ & & VI_{1}--\\ & & VI_{2^-}(\textbf{581}) \end{array}$$

Ndls. from lgr. (2), C₆H₆, alc. or 80% AcOH (1) — Volatile with steam (1).

[For prepn. of \bar{C} from 3-chloronaphthylamine-1 (1) via diazotization and hydrolysis of the diazonium salt with steam see (1); from 2,3,4-trichloronaphthol-1 [Beil. VI-613] by partial reduction with HI (D=1.7) in AcOH on boilg 7 hrs. (100% yield) see (2).]

C is sol. in aq. alk., and the result. soln. couples with solns. of diazonium salts (1).

Č with Br₂ aq. (and alk.?) gives 3-chloro-2,4-dibromonaphthol-1, pr. from 90% formic acid, m.p. 112° (1).

[Č in 10% aq. KOH shaken with Me₂SO₄ for 20 min. gives (81% yield (2)) 3-chloronaphthol-1 methyl ether, oil, b.p. 162-164° at 18 mm. (2).]

- **3-Chloro-1-naphthyl acetate:** ndls. from $\lg r$, mp. 69° (2). [From \tilde{C} with acetyl chloride in C_6H_6 on refluxing 3 hrs in C_6H_6 (66% yield (2))]
- 3-Chloro-1-naphthyl benzoate: ndls. from lgr., m.p. 118-119° (2). [From C in 10% aq. KOH on shaking with BzCl (71% yield (2)).]

3:4170 (1) Hodgson, Elliott, J. Chem. Soc. **1934**, 1707. (2) Franzen, Stauble, J. prakt. Chem. (2) **103**, 385–387 (1922).

Many recorded m.p.'s lower than these values [cf. Beil. IX-343 and (3)] were on samples now known to have been impure.

Cryst. from lgr. (1) or mixt. of $C_6\overline{H}_6 + \text{lgr.}$ (4) (3); pr. from aq., tbls. from C_6H_6 , ndls. from alc. — Can also be purified by distn. in vac. (1). — Volatile with steam (?).

[For prepn. of \bar{C} from 2,6-dichlorotoluene (3:6270) (57% yield (4)) via bromination to 2,6-dichlorobenzyl bromide, conversion to corresp. acetate, and oxidn. of latter with KMnO₄ see (1) (4); from 2,6-dichlorobenzaldehyde by oxidn. with KMnO₄ see (2); for older less satisfactory methods see Beil IX-343.]

 \bar{C} on htg. begins to lose CO₂ at 235° (5) [\bar{C} htd. with a large excess 50% aq. KOH at 150° for 24 hrs. was recovered unchanged to extent of 90% (9)]

C on nitration under stated conditions (1) gives 94% yield 2,6-dichloro-3-nitrobenzoic acid, cryst. from toluene, m.p. 152° (1).

 \bar{C} (as $K\bar{A}$) htd. with anilme + $K_2CO_3 + Cu$ in amyl alc. gives small yield of diphenylaminecarboxylic acid-2, cryst. from C_6H_6 , m.p. 181° (1). [Note loss of both chlorine atoms.]

 \bar{C} htd. with acetamide for 6 hrs. at 225-235° gave 93% yield (5) m-dichlorobenzene (3:5960), b.p. 172°.

 \overline{C} htd. with PCl₅ (6) or with SOCl₂ + pyridine (4) yields 2,6-dichlorobenzoyl chloride, b.p. 142-143° at 21 mm. (6), 126-128° at 18 mm. (7).

- Methyl 2,6-dichlorobenzoate: from $Ag\bar{A} + MeI$ (8); b.p. 250° (8).
- Ethyl 2,6-dichlorobenzoate: from AgĀ + EtI (8) or from Č via SOCl₂, followed by EtOH (82% yield (5)); cannot be prepared by direct esterification (8); b.p. 264-265° (8). [This ester on htg. with AlCl₃ at 120-130° for 2½ hrs. gives EtCl (91%) and Č (92%) (5).]
- D 2,6-Dichlorobenzamide: ndls. from alc., m.p. 202° (8), 198° (7). [This amide htd. with NaCl.AlCl₃ over free flame evolves HCl and gives (67% yield (5)) 2,6-dichlorobenzonitrile, ndls. from lgr., m.p. 142.5-143 5° (5), 143° (9); the nitrile can be reconverted to the amide with alk. H₂O₂ (9).]
- 2,6-Dichlorobenzanilide: unrecorded.

[See also cis-1,2-dichloro-1,2-diphenylethylene (3:1380).]

Colorless tbls. from alc.; \tilde{C} is much less sol. in alc. than its *cis* isomer (3:1380); 100 pts. abs. alc. at 24 4° dis. 0.71 pt. \tilde{C} , but soly. of \tilde{C} is diminished by pres. of its stereoisomer (10). — \tilde{C} (like its isomer) is very sol. ether.

Note that $\bar{\mathbb{C}}$ (the higher-melting tolane dichloride) has now been shown (4) to have the trans configuration, many earlier reports to the contrary notwithstanding.

Note also that $\bar{\mathbb{C}}$ with 1,1,2,2-tetrachloro-1,2-diphenylethane (tolane tetrachloride) (3:4496) gives an isomorphous mixt. (2), formerly erroneously regarded as an individual cpd. designated as "ditolane hexachloride."

PREPARATION OF C

Note that in all processes (below) for prepn. of Č more or less of the lower-melting (cis) stereoisomer is always formed.

FROM DINUCLEAR INITIAL MATERIALS

From diphenylacetylene (tolane). [For prepn. of \bar{C} from tolane [Beil. V-656, V₁-(319), V₂-(568)] with Cl_2 in CHCl₃ see (7).]

From trans-1,2-diphenylethylene (stilbene). [For prepn. of \bar{C} from stilbene (1:7250) with PCl₅ (2 moles) in POCl₃ at 170° see {12}.]

From 1,1,2,2-tetrachloro-1,2-diphenylethane (tolane tetrachloride). [For prepn. of \bar{C} from tolane tetrachloride (3:4496) by removal of two adjacent chlorine atoms by use of Zn dust in EtOH (1) (6) (7) (10), Zn dust in AmOH (6), Fe powder in boilg. AcOH (14) (6) (note that in this method ratio of \bar{C} to lower m.p. stereomer is 1:5 (6)), or by use of excess conc. (2 N) MeMgCl (11), or with H_2 + hydrazine hydrate in MeOH/KOH at b.p. for $1\frac{1}{2}$ hrs. (3) see indic. refs.]

From benzoin. [For formn. of \tilde{C} from benzoin (1:5210) with PCl₅ at 0° (much benzoylphenyl-dichloromethane ("chlorobenzil") [Beil. VII-436, VII₁-(234)] also being formed) see (20).]

From Mononuclear Initial Materials

From benzotrichloride. [For prepn. of \tilde{C} from benzotrichloride (3:6540) with Cu powder (yield of total mixed stereoisomers 68% (15), 23.5% (16) (17)), by action of excess conc. (2 N) MeMgCl (yield total mixed stereoisomers 22% (11)), by action of hydrazine hydrate + Pd in MeOH/KOH (35% yield (3)), or for formn of \tilde{C} (together with other products) by pyrolysis over hot Pt (18) see indic. refs.]

From benzal (di)chloride. [For form. of \tilde{C} (together with other prods.) from benzal (di)chloride (3:6327) by pyrolysis over hot Pt see (18).]

FROM MISCELLANEOUS SOURCES

[For formn. of \bar{C} from CaC₂ with satd. soln. of Cl₂ in C₆H₆ see (13); from benzoyl-phenyl-diazomethane (azibenzil) [Beil. VII₁-(395), XXIV-208] with oxalyl (di)chloride (3:5060) in C₆H₆ (38.5% yield \bar{C}) see (9); from 1,1,2-trichloro-1,2-diphenylethane [Beil. V-601] by elimination of HCl with alc. KOH see (19); for formn. of \bar{C} from its lower-melting stereoisomer (3:1380) by distn. (about 32% conversion to \bar{C} (10)) (12) (6) see indic. refs.]

CHEMICAL BEHAVIOR OF C

 $\ddot{\mathbf{C}}$ on htg. is partially transformed (6) (12) to the lower-melting isomer (3:1380); on distn. conversion is about 68% (10).

Reduction of C. C with conc. HI and red P in s.t. at 170° for 20 hrs. gives (16) (20) bibenzyl (1:7149), m.p. 52°.

Elimination of 2 chlorine atoms. \bar{C} with Na/Hg in alc. (1) (16), or \bar{C} with Zn dust in boilg. alc. (7) (10), or \bar{C} with alc. KOH in s.t. at 180° (12) gives diphenylacetylene (tolane) [Beil. V-656, V₁-(319), V₂-(568)], m.p. 60°.

Addn. of halogens. \bar{C} with Cl_2 in C_6H_6 soln. yields (13) 1,1,2,2-tetrachloro-1,2-diphenylethane (tolane tetrachloride) (3:4496). — \bar{C} does not (12) add Br₂, and the expected prod. 1,2-dibromo-1,2-diphenylethane is unreported from any other source. Nitration of \bar{C} . The nitration of \bar{C} has never been studied, and neither mono nor dinitro

derivs. are reported from any other source.

[For formn. of \bar{C} by oxidation with $CrO_3/AcOH$ of 4,4'-dichlorobenzilic acid (2), of bis-(p-chlorophenyl)methane (7), of tris-(p-chlorophenyl)methane (16), of 1,1,4,4-tetra-(p-chlorophenyl)butyne-2 (91% yield (4)), or of 1,1,4,4-tetra-(p-chlorophenyl)butyne-1,2,3 (94% yield (5)) see indic. refs.; from oxidn. of β , β -di-(p-chlorophenyl)propionic acid with aq. KMnO₄ see (10); from 2,2-dimethyl-5,5-bis-(p-chlorophenyl)pentanone-3 [α -(p,p'-dichlorophenyl)propiophenone] by oxidn. with alk. KMnO₄ see (22); from β , β -di-(p-chlorophenyl)propiophenone by oxidn. with aq. KMnO₄ in NaOH + pyridine soln. see (13); from bis-(p-chlorophenyl)methyleneacetophenone with KMnO₄ in acetone (71% yield) see (3)]

[For formn. of C from 1,1-di-(p-chlorophenyl)ethane (3:0995) (39), from 1-chloro-2,2-bis-(p-chlorophenyl)ethylene (3:1430) (84% yield (40)), or from 1,1-dichloro-2,2-bis-(p-chlorophenyl)ethylene (3:2438) (40), all by oxidn. with CrO₃/AcOH, see indic. refs.]

[$\tilde{\mathbf{C}}$ on reduction with 3% Na/Hg in 90% alc. (20), with Al/Hg in 80% alc. (6) (11), with Zn dust + AcOH on boilg. (20), with Zn dust + alc. KOH (20) or NaOH (23), or simply with boilg. alc. KOH (24) gives (yields: 100% (23), 96% (6) (11) di-(p-chlorophenyl)carbinol (4,4'-dichlorobenzhydrol) [Beil. VI-680, VI₁-(327)], cryst. from alc., m.p. 94° (20), 93° (24), 91.5° (23), 89-90° (6) (11) (corresp. 3,5-dinitrobenzoate, m.p. 174-176° (41)); note that in some cases this main prod. is accompanied by tetra-(p-chlorophenyl)ethylene glycol (see below). — $\tilde{\mathbf{C}}$ on reduction with Zn dust + AcOH + dil. H₂SO₄ (25), or in alc. in bright sunlight for 5 days (20) ef (26), gives (85% yield (20)) tetra-(p-chlorophenyl)ethylene glycol [Beil. VI-1058, VI₁-(523)], m p. 180° (6) (11), 175° (20) (accompanied by smaller amts. of other prods.)

[\bar{C} with sodium phenylacetylene in dry ether gives (57% yield (3)) bis-(p-chlorophenyl)-ethynyl-carbinol, m.p. 163-164° (3); \bar{C} with diphenylmethyl sodium gives (27) bis-(p-chlorophenyl)-diphenylmethyl-carbinol, m.p. 183-184° (27); \bar{C} with McMgI in dry ether gives (39) (19) not only some bis-(p-chlorophenyl)-methyl-carbinol, m.p. 67.0-68 5° (39), but also (68% yield (19)), by loss of H₂O, unsym.-di-(p-chlorophenyl)cthylene, m.p. 91°(3:2475); \bar{C} with β-(diphenylvinyl)MgBr gives (12% yield (28)) 1,1-di-(p-chlorophenyl)-3,3-diphenylpropen-2-ol-1, m.p. 85°, which on htg. at 130-150° loses H₂O yielding 1,1-di-(p-chlorophenyl)-3,3-diphenylpropadiene-1,2, m.p. 93-95° (28); \bar{C} with ethyl bromoacetate + Zn in C₆H₆ gives (30% yield (28) ethyl β , β -di-(p-chlorophenyl)- β -hydroxypropionate, m.p. 102° (28).]

[Č with PCl₅ at 150° gives (17) (15) (29) dichloro-di-(p-chlorophenyl)methane (4,4'-dichlorobenzophenone dichloride), m.p. 52-53° (15), 52.5° (17).]

[$\bar{\mathbf{C}}$ on fusion with NaOH yields (7) chlorobenzene (3:7903) + p-chlorobenzoic acid (3:4940). — $\bar{\mathbf{C}}$ with 10% aq. NaOH in pres. of Cu 5 hrs. at 190° under press. yields (30) 4,4'-dihydroxybenzophenone [Beil. VIII-317, VIII₁-(641)], m.p. 214° (30).]

[C with hydrazine hydrate in isopropyl alc. in s.t. at 150–160° for 7 hrs. gives (56% yield (42)) 4,4'-dichlorobenzophenone hydrazone, m.p. 91–93°, which on Wolff-Kishner reduction gives (21% yield (42)) 4,4'-dichlorodiphenylmethane (3:1057).]

[C with aq. NH₄OH in pres. of CuO + NH₄NO₃ + KClO₃ under press. at 180° (1) cf. (31) gives (92% yield (1)) 4,4'-diaminobenzophenone [Beil. XIV-88, XIV₁-(391)], m.p. 245-246° (1), 242.5° (31); some half reactn. prod., viz., 4-amino-4'-chlorobenzophenone, m.p. 185° (1), is also formed. — For similar reactn. of C with diethylamine leading to 4-chloro-4'-diethylaminobenzophenone see (32). — For reactn. of C with N-methyl-a-

phenylindole and use in prepn. of dyes see (33); with ethylbutyl-m-toluidine see (34); with aminoanthraquinone derivs. see (35) (36).]

- [$\bar{\rm C}$ on nitration with 10 wt. pts. fumg. HNO₃ (D=1.47) in cold (37) or with 5 pts. abs. HNO₃ at 0° (2) gives (81% yield (37)) 4,4'-dichloro-3,3'-dinitrobenzophenone, cryst. from AcOH, m.p. 132.5° (2), 132-133° (38), 120° (37); $\bar{\rm C}$ on trinitration at 130° with 1.8 wt. pts. conc. H₂SO₄ contg. 2 pts. KNO₃ gives (37) 4,4'-dichloro-3,3',5-trinitrobenzophenone, cryst. from AcOH, m.p. 140° (37); $\bar{\rm C}$ on tetranitration with 10 pts. fumg. H₂SO₄ + 1 pt. KNO₃ at 150° gives (37) 4,4'-dichloro-3,3',5,5'-tetranitrobenzophenone, cryst. from AcOH, m.p. 202° (37).] [A mono-nitrated $\bar{\rm C}$, viz., 4,4'-dichloro-3-nitrobenzophenone. ndls. from alc., m.p. 87° (2), 88-89° (38) has been obtd. indirectly.]
 - 4,4'-Dichlorobenzophenone oxime: ndls. from alc., m.p. 136-136.5° (1), 136° (7), 135° (8) (9), 134° (5). [From \(\bar{C}\) with excess NH₂OH in alc. at 100° (9).] [This prod. by Beckmann rearr. with conc. H₂SO₄ yields p-chlorobenz-p-chloroanilide, m.p. 213-213.5° (1).]
 - ---- 4,4'-Dichlorobenzophenone phenylhydrazone: not reported.
 - ---- 4,4'-Dichlorobenzophenone p-nitrophenylhydrazone: not reported.
 - ---- 4,4'-Dichlorobenzophenone 2,4-dinitrophenylhydrazone: m.p. 238-240° (40).

3:4280 2-CHLORO-4-HYDROXYBENZ- $C_7H_5O_2Cl$ Beil. VIII - 81 $VIII_1$ —

Colorless ndls. from AcOH (1) or aq. (2). — Volatile with steam but much less so than the isomeric 4-chloro-2-hydroxybenzaldehyde (3:0960) (1).

[For prepn. of \bar{C} from *m*-chlorophenol (3:0255) via Reimer-Tiemann reactn. see (1); via anhyd. HCN + AiCl₃ + C₆H₆ (50% yield) see (2); for prepn. (alm. 100% yield (1)) from 2-chloro-4-nitrotoluene via 2-chloro-4-aminotoluene and subsequent diazo reactn. see (1).]

C does not reduce NH₄OH/AgNO₃ or Fehling soln. (1).

 \bar{C} with aq. FeCl₃ gives only a slight ppt. [dif from 4-chloro-2-hydroxybenzaldehyde (3:0960)]; the copper and chromium salts are lighter green in color than those from that isomer (1).

Č on mononitration as specified (3) yields 5-nitro-2-chloro-4-hydroxybenzaldehyde, vol. with steam, colorless ndls. from alc., m.p. 125° (3). [This product yields a phenylhydrazone, silky dark purple ndls. from alc., m.p. 166° sl. dec; a p-mtrophenylhydrazone, deep or. ndls. from AcOH, m.p. 266° dec.; and a semicarbazone, light or. ndls from dil. AcOH, m.p. 266° dec. (3).]

Č on dinitration as specified (3) yields 3,5-dinitro-2-chloro-4-hydroxylenzaldehyde, not volatile with steam, pale yel. massive pr. from aq , m.p. 93° (3). [This product yields a phenylhydrazone, br.-purple ndls from alc., m.p. 210° dec.; a p-nitrophenylhydrazone, red-br. ndls. from dil. AcOH, m.p. 267° dec.; and a semicarbazone, lt. br. ndls. from dil. AcOH, m.p. 192° dec (3).]

- 2-Chloro-4-hydroxybenzaldoxime: cryst. from alc., m p 194° (2).
- --- 2-Chloro-4-hydroxybenzaldehyde phenylhydrazone: unrecorded.
- **D** 2-Chloro-4-hydroxybenzaldehyde p-nitrophenylhydrazone: dark red pl. from ale. or vermilion red cryst. from AcOH, m.p. 288° dec. (1).
 - --- 2-Chloro-4-hydroxybenzaldehyde 2,4-dinitrophenylhydrazone: unrecorded.
- 2-Chloro-4-hydroxybenzaldehyde semicarbazone: yel cryst. from alc, m.p. 214°
 (1).
- **② 2-Chloro-4-acetoxybenzaldehyde:** colorless ndls. from dil AcOH, m.p. 51 5° (1).
- ② 2-Chloro-4-benzoxybenzaldehyde: colorless ndls. from alc, m.p. 96 5° (1). [Note that this ③ does not give good distinction from isomeric 4-chloro-2-hydroxybenzaldehyde (3:0960) whose corresponding benzoate has m.p. 98.5° (1).]

3:4280 (1) Hodgson, Jenkinson, J. Chem Soc. **1927**, 1740-1742. (2) Gattermann, Ann. **357**, 334 (1907). (3) Hodgson, Jenkinson, J. Chem. Soc. **1928**, 2274-2275.

Colorless cryst. from toluene + lt. pet. (2), from 50% AcOH (14), or from alc. (11). [For prepn. of $\bar{\mathbf{C}}$ from 4,4'-diaminobiphenyl (benzidine) [Beil. XIII-214, XIII₁-(58)] via tetrazotization and use of Cu powder (9), Cu₂Cl₂ (3), or HgCl₂ complex (82% yield (10)), see indic. refs.; from biphenyl (1:7175) in AcOH with Cl₂ (41% yield (2)) (convenient for prepn. small amts. $\bar{\mathbf{C}}$) see (2); from 4,4'-dinitrobiphenyl with SOCl₂ in s.t. for 10 hrs. at 200-210° see (7); from p-chloroiodobenzene [Beil. V-221, V₁-(119)] with Cu powder at 200-250° (82% yield) see (15).]

[For formn. of \tilde{C} from chlorobenzene (3:7903) by pyrolysis see (16) (12) (for discussion of formn. during mfg. of phenol from chlorobenzene see (19)); from biphenyl (1:7175) with Cl_2 in pres. of $SbCl_5$ (17) or I_2 (13) see indic. refs.; from 4,4'-dihydroxybiphenyl (1:1640) with PCl_5 see (13); from 4,4'-dichlorobiphenyl-3,3'-diarboxylic acid on htg. see (18); from 4,4'-dichloro-3,3'-diaminobiphenyl via tetrazotization and htg. with alc. see (14); from decompn. of bis-(p-chlorobenzoyl) peroxide on htg. see (6)]

[For manuf of \bar{C} or mixts. of dichlorobiphenyls contg. \bar{C} from biphenyl with Cl_2 see (20) (21) (22) (23); for use as insecticide see (24)]

[C htd. under press with conc. aq. NH₄OH in pres. of Cu₂Cl₂ and Ca (OH)₂ gives (99.5% yield (25)) 4,4'-diaminobiphenyl (benzidne); C with aq. over Cu + silica gel at 525-600° gives (26) 4,4'-dihydroxybiphenyl (1:1640)]

 \bar{C} on mononitration in 15 pts. AcOH with 10 pts. HNO₃ (D=1.46) at 100° for ½ hr. (2), or in nitrobenzene soln. with HNO₃ (D=1.52) as directed (2), gives alm. quant. yield of 4,4'-dichloro-2-nitrobiphenyl, cryst from alc or CCl₄, m.p. 102° (2) (27). [This prod. does *not* react with piperidine (27)]

 \bar{C} on dinitration by soln in 7½ pts HNO₃ (D=1.52) in an ice bath gives (2) mixt. contg. 81.3% 4,4'-dichloro-2,3'-dinitrobiphenyl and 18.7% 4,4'-dichloro-2,2'-dinitrobiphenyl. By recryst. from AcOII 4,4'-dichloro-2,3'-dinitrobiphenyl is obtd in ndls., m p. $141-142^{\circ}$ (2), 140° (28), which on warming with piperidine for a few seconds yields (28) 4-chloro-4'-piperidino-2,3'-dinitrobiphenyl, or ndls from alc., m p. 132° (28) (note that the principal dinitration prod. of \bar{C} is the 2,3'-dinitro- \bar{C} and not the 2,2'-isomer as formerly (29) supposed). — From the mother liq. of the above dinitration may be obtd. (2) the true 4,4'-dichloro-2,2'-dinitrobiphenyl, m.p. $138-139^{\circ}$ (2); this does not react with piperidine

 \bar{C} on trinitration with 10 pts. HNO₃ (D=1.52) for 2 hrs. at 100° gives (2) (30) 4,4′-dichloro-2,3′,5′-trinitrobiphenyl, ndls. from AcOH, m.p. 166-167° (2), 164-165° (30); this prod. warmed with piperidine gives 4-chloro-4′-piperidino-2,3′,5′-trinitrobiphenyl, crimson pr. from AcOH, m.p. 182° (2).

 \bar{C} on oxidn. with CrO₃ in AcOH yields (13) p-chlorobenzoic acid (3:4940), m.p. 237° (13).

3:4315 6,7-DICHLORONAPHTHOL-1

M.P. 151° (1) (2) 149–150° (3)

Cryst from CHCl₃ (3).

[For prepn. from β -(3,4-dichlorobenzal)propionic ac [Beil. IX-614] by distn. see (1) (2) (3); \bar{C} is sepd. from the smaller proportion of 7,8-dichloronaphthol-1 (3:2635) by the greater soly. of the latter in lgr. (3).]

C on oxidn. with $K_2Cr_2O_7 + dil$. H_2SO_4 yields (3) 4,5-dichlorophthalic ac (3:4890), which during m.p. detn. is converted to 4,5-dichlorophthalic anhydride (3:4830), m.p. 184-185° (3).

Č in alk. soln. coupled with diazotized naphthionic acid (1-aminonaphthalenesulfonic acid-4) gives a deep red-bluish color which upon acidification becomes dark yellow (3). [Dif. from 7,8-dichloronaphthol-1 (3:2635) q.v.]

6,7-Dichloro-1-naphthyl acetate: ndls. from dil. alc., or compact pr. from CHCl₃ lgr., m.p. 102-103° (3).

3:4315 (1) Armstrong, Wynne, Chem. News **71**, 253 (1895). (2) Armstrong, Wynne, Proc. Chem. Soc. **11**, 78-79 (1895); Ber. **29**, Referate, 223-224 (1896). (3) Erdmann, Schwechten, Ann. **275**, 286-288 (1893).

3:4325 3,3-DICHLORO-2,2-DIMETHYLBUTANE

M.P. 151-152° (1)

Colorless cryst. subliming readily even at ord. temp.

[For prepn of \bar{C} from ter-butyl methyl ketone (pinacolone) (1:5425) with PCl_5 at 0-5° (1) (2) (3) (4) (5) (6) (7) (9) see indic. refs Note that \bar{C} (by loss of HCl) is always accompanied by more or less 3-chloro-2,2-dimethylbutene-3 (3:7340) and other prods.]

C on htg. with phenol + KOAc yields (8) 3-chloro-2,2-dimethylbutene-3 (3:7340).

 \bar{C} on htg. at 150-230° with powdered KOH (moistened with alc.) gives (65% yield (6)) (9) (2) ter-butylacetylene [Beil. I-256], b.p. 37.8° at 760 mm., $D_0^{20} = 0.6683$, $n_{\alpha}^{20} = 1.37257$ (6); note that use of NaOH instead of KOH gives by loss of 1 HCl only 3-chloro-2,2-dimethylbutene-3 (3:7340) and no ter-butylacetylene (9).

3:4330 2-CHLORONAPHTHOIC ACID-1

M.P. 152-153° (1) 151-152° (2)

151° (4)

Cryst. from C_6H_6 (2). — Sol. in 1000 pts. aq. at 20° or in 126 pts. aq. at 100°; eas. sol. alc., ether (1).

[For prepn. of \bar{C} from 2-hydroxynaphthoic acid-1 [Beil. X-328, X₁-(144)] with PCl₅ (3 moles) in s.t. at 180-190° for 8 hrs. followed by treatment with aq. see (1) (2); from 1-chloroformylnaphthyl-2-phosphoric acid dichloride [Beil. X-329] with PCl₅ (2 moles) in s.t. at 180-190° followed by treatment with aq. see (1) (2); from 2-chloro-1-(chloromethyl)-naphthalene (4) by oxidn. with dil HNO₃ for 15 days see (4).]

 \bar{C} in aq. susp. with 2% Na/Hg yields (1) α -naphthoic acid (1:0785), m.p. 160° (1).

C does not esterify upon treatment in MeOH with HCl gas (3).

Salts: CaĀ_{2.2}H₂O; sol. in 150 pts. cold aq. or 75 pts. hot aq.; loses water of hydration completely at 180° (1).

- Methyl 2-chloro-1-naphthoate: pr. from alc. + toluene, m.p. 50° (1) (2), b.p. 176-180° at 18.5 mm. (2). [From AgA with MeI in s.t. at 100° (1) or from C with ethereal diazomethane (2)] [This ester is very resistant to hydrolysis (1) (2).]
- Ethyl 2-chloro-1-naphthoate: unreported.
- --- p-Bromophenacyl 2-chloro-1-naphthoate: unreported.

3:4340 2,5-DICHLOROBENZOIC ACID Cl
$$C_7H_4O_2Cl_2$$
 Beil. IX - 342 COOH IX_1 -(141)

Ndls. from aq. or dil. alc. — Somewhat volatile with steam. — Sol. in 1193 pts. aq. at 11° (12); in 1177 pts. at 14° (11).

[For prepn. of \bar{C} from 2,5-dichlorotoluene (3:6245) by htg. with dil. HNO₃ in s.t. at 140° (60% yield (4)) (5) (13) (2) (8) (7) or htg. with KMnO₄ (14) see indicated refs.; for prepn. of \bar{C} from 2,5-dichlorobenzaldehyde (3:1145) via Cannizzaro reactin. (84% yield (1)) see (1) (4); for prepn. (90-95% yield (9)) from 5-chloro-2-aminobenzoic acid via diazo reactin + CuCl see (9) (11); from 2,5-dichloroaniline via 2,5-dichlorobenzointrile (m.p. 130°) and its hydrolysis with fumg. HCl at 180° see (15); for prepn. of \bar{C} from benzoic acid + KClO₃ + HCl see (12) (21); for still other misc. methods see Beil. 1X-342, IX₁-(141).

For f p./compn. data on mixtures of \bar{C} with *m*-chlorobenzoic acid, m.p. 154.4° (3:4392), and with 2,3-dichlorobenzoic acid, m.p. 154.4° (3:4650), see (2).

 \ddot{C} on htg with 3 pts. conc. H_2SO_4+2 pts. aq. loses CO_2 at 220° yielding p-dichlorobenzene (3:0980) (5).

The direct nitration of \bar{C} is unrecorded. [However, 2,5-dichloro-3-nitrobenzoic acid, ndls. from AcOH, m.p. 220°, and 2,5-dichloro-6-nitrobenzoic acid [Beil. 1X-404], m.p. 143_144°, have both been prepd. by oxidn. (16) of the corresp. aldehydes.]

 \tilde{C} with PCl₅ (17) or with SOCl₂ (18) yields 2,5-dichlorobenzoyl chloride, b p. 137° at 15 mm. (17), 95.3-95.5° at 1 mm. (18). [For formn. in chlorination of benzoyl chloride see (2).]

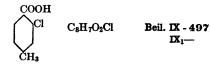

- Methyl 2,5-dichlorobenzoate: unrecorded.
- Ethyl 2,5-dichlorobenzoate: b.p. 271° cor. (12). [For study of hydrolysis see (20).]
- 2.5-Dichlorobenzamide: woolly ndls. from aq., m.p. 155° (12).
- D 2,5-Dichlorobenzanilide: from 2,5-dichlorobenzoyl chloride (above) + aniline (11), pr from C₆H₆, m p. 240° (11).
- **D** 2,5-Dichlorobenz-3-nitroanilide: from 2,5-dichlorobenzoyl chloride (above) + m-nitroaniline (19), ndls. from aq. MeOH, m.p. 151-152° u.c. (19).

3:4355 2-CHLORO-4-METHYLBENZOIC ACID

Colorless ndls. from alc.; spar. sol. cold, more sol. hot, aq.; cas. sol. alc., ether, CHCl₃, hot C₆H₆.

[For prepn. of \bar{C} from 3-chloro-4-isopropyl-1-methylbenzene (3-chloro-p-cymene) (3:8770) by oxidn. with 15 pts. boilg. HNO₃ (D=1.24-1.29) (other products are also formed) see (2); from 3-chloro-4-methylbenzomtrile, m.p. 61-62° (1), by hydrol. with boilg. aq. KOH (100% yield) see (1).]

Salts. NH₄ \bar{A} , K \bar{A} , Na \bar{A} H₂O, all very eas. sol. both in aq. and in alc. (1); Ca \bar{A}_2 .2H₂O, Ba \bar{A}_2 .5H₂O, eas. sol. hot aq. (1); Ag \bar{A} , spar. sol. cold aq. but eas. sol. hot aq. (1).

[\tilde{C} on mononitration by soln. in fumg. HNO₃ (D=15) at ord. temp. followed by stdg. several hrs. ppts. 2-chloro-5-nitro-4-methylbenzoic acid [Beil. IX-503], cryst. from hot aq or alc., m.p. 180° u.c. (1), 180–181.5° u.c. (3), 180–181° (4) (note that the isomeric 2-chloro-3-nitro-4-methylbenzoic acid [Beil. IX-503], m.p. 192° u.c. (3), may be formed from \tilde{C} under certain conditions (3)).]

 $|\bar{C}|$ on dinitration with mixt. of 1 pt. fumg. HNO₃ (D=1.52) + 4 pts. conc. H₂SO₄ gives (3) either in cold or on htg. exclusively 2-chloro-3,5-dinitro-4-methylbenzoic acid [Beil. IX-506], ndls. from alc., m.p. 233° u.c. (3)]

- Ethyl 2-chloro-4-methylbenzoate: oil, b.p. not reported; $D_4^{21.4} = 1.1591$ (5), $n_{He}^{21.4} = 1.52443$ (5)
- —— 2-Chloro-4-methylbenzamide: ndls. from alc., m.p. 182° (1). [From partial alk. hydrolysis of 2-chloro-4-methylbenzonitiile (see above) (1)]

3:4355 (1) Claus, Davidsen, J. prakt Chem (2) 39, 491–496 (1889). (2) Fileti, Crosa, Gazz. chim ital. 16, 288-290 (1886). (3) Claus, Davidsen, Ann. 265, 345-346, 348-349 (1891). (4) Fileti, Crosa, Gazz. chim. ital. 18, 312 (1888). (5) von Auwers, Harres, Z. physik. Chem. A-143, 18 (1929).

Pr. (from hot aq.). - Spar. sol cold aq.

[For prepn from p-chlorophenol (3:0475) by htg. with chloroacetic ac. (3:1370) and aq. alk see (1) (4) (5) (6).]

C htd. with conc. HCl in s.t. at 150° yields p-chlorophenol (3:0475) (3).

 \bar{C} refluxed with $1\frac{1}{2}$ pts. thionyl chloride for $1\frac{1}{2}$ hrs. gives (90% yield) p-chlorophenoxyacetyl chloride, b.p. 142° at 17 mm., m.p. 18.8° {1).

The methyl ester (b.p. 177-180°) and the ethyl ester, ndls. (from alc.), m.p. 49°, have been prepared from the acid chloride (1)

p-Chlorophenoxyacetamide: from the acid chloride by treatment with excess (NH₄)₂CO₃; ndls. from alc., m.p. 133° (1).

p-Chlorophenoxyacetanilide: from the acid chloride by action of aniline (2 moles) in C_6H_6 ; ndls. (from alc.), m.p. 125° (1).

3:4390 4-CHLOROPHTHALIC ACID

M.P. 157°	(1)	
156°	(2)	
151°	(3)	
150-150.5°	(4)	
150° in s.t.	(5)	
148° u.c.	(6)	

[See also 4-chlorophthalic anhydride (3:2725).]

Ndls. from alc.; cryst from CoH6 or CCl4. — Eas. sol. aq., alc., ether, or AcOH.

[For prepn. of \bar{C} from 4-chlorophthalic anhydride (3:2725) by warming with aq. or from dimethyl 4-chlorophthalate (3) or diethyl 4-chlorophthalate (5) by hydrol with alk. see indic. refs.; from neutral sodium phthalate in aq. alk. on treatment with Cl₂ see (3) (7) (8) (9) (10); from 4-chloro-2-methylbenzoic acid (3:4700) (11) (12), from 5-chloro-2-methylbenzoic acid (3:4670) (11), from 4-chloro-2-methylacetophenone [Bcil. VII-306] (2), or from 7-chloro-1,2,3,4-tetrahydronaphthalene (1) by oxidn. with alk. KMnO₄ see indic. refs.; from 6-chloroindanone-1 [Beil. VII-361] on evapn. with hot 25% HNO₃ see (4); from 1,6-dichloronaphthalene (3:0810) (13), 2,6-dichloronaphthalene (3:4040) (14) (6), 2,7-dichloronaphthalene (3:3445) (14), 6-chloronaphthol-2 (3:3500) (6), or 4-chloro-2-methylbenzoic acid (above) (12) on oxidn. with dil. HNO₃ in s.t. as directed see indic. refs.; from the trichloride of 4-sulfophthalic acid [Beil. XI-407] with PCl₅ in s.t. at 220° followed by KOH hydrolysis of the 4-chlorophthalyl (di)chloride see (15); from 4-sulfophthalic anhydride (16) by htg. with HCl + NaClO₃ see (16)

C on htg. above m.p. gives 4-chlorophthalic anhydride (3:2725).

[\bar{C} on fusion with KOH (11) or with NaOH at 165-175° (10) gives (100% yield (10)) 4-hydroxyphthalic acid [Beil. X-499, X_1 -(255)], m p. 204-205°, with conv. to corresp. anhydride, m p. 171° (note that this same prod. is also obtd. from the isomeric 3-chlorophthalic acid (3:4820)).]

[Č htd. under press. at 350° with aq. + cat. loses CO₂ presumably yielding (17) m-chlorobenzoic acid (3:4392) and/or p-chlorobenzoic acid (3:4940).]

 $[\bar{C} \text{ with NH}_3 \text{ gas} + \text{cat. as directed (18) yields 4-chlorophthalonitrile, m.p. 130-132° (19).}]$

[For use of C as softener for cellulose derivatives see (20); for reaction of C with naphthalene + AlCl₃ yielding intermediates for vat dyes see (21).]

 \bar{C} on htg. with resorcinol + few drops conc. H_2SO_4 , then dissolving in alk., gives fluorescein reactn. (2) $-\bar{C}$ is unstable toward KMnO₄ (2).

Salts. BaĀ, CaĀ, dif. sol. aq.; BaĀ.H₂Ā, spar. sol. even in hot aq. (11) (for table of heavy metal salts see (22)).

Esters. Dimethyl 4-chlorophthalate; from Ag₂Ā with MeI (15), from 4-chlorophthalyl (di)chloride (above) with MeOH (15), or from C in MeOH with HCl gas (3); ndls. from

lgr., m.p. 38° (3), 37° (15), b.p. 186–187° at 32 mm. (3); diethyl 4-chlorophthalate; from \dot{C} in alc. with HCl gas (15) or from diethyl 4-aminophthalate via diazotization and use of Cu₂Cl₂ reactn. (70% yield (5)), b.p. 300–305° (15), 185–190° at 25 mm. (5), 173–174° at 16 mm. (1).

Pr. from hot aq., 30% AcOH or C_6H_6 . — \tilde{C} is spar. sol. cold aq., e.g., 1 pt. \tilde{C} is sol. at 0° in 2840 pts. aq. (23); 100 ml. satd. aq. soln. at 25° conts. 0.0385 g. \tilde{C} (60). — \tilde{C} is eas. sol. hot aq., alc., ether. — At 14–16° C 100 ml. of satd. soln. of \tilde{C} in ether conts. 14 g. \tilde{C} ; in C_6H_6 , 0.66 g. \tilde{C} ; in CS_2 , 0.62 g. \tilde{C} ; in CCl_4 , 0.08 g. \tilde{C} (8). — For study of soly. of \tilde{C} in m-chlorotoluene (3:8245), or in m-chlorotoluene (3:8275) see (10); in acetone or C_6H_6 see (6); for soly of \tilde{C} in aq. solns. of various salts including Na \tilde{A} see (60). — For distribution coefficients of \tilde{C} at 25° between aq. + toluene or between aq. and CHCl₃ see (102).

 \tilde{C} can be sublimed under reduced press. (24) (14). — \tilde{C} is but very slightly volatile with steam (for details see (12)). — For study of adsorption of \tilde{C} by charcoal from acetone or C_{aHa} soln, see (6).

Binary systems contg. \bar{C} : [For f.p./compn. data on system \bar{C} + H₂O see (25). — For f.p./compn. data and diagram of system \bar{C} + benzoic acid (1.0715) (eutectic, m.p. 96.0° (20), 95.4° (27) (8), contg. 36 wt. % \bar{C} (27) (20) (8) (28)) see indic refs. — For f.p./compn. data on systems \bar{C} + m-toluic acid (1:0705) (26), \bar{C} + m-hydroxybenzoic acid (1:0825) (26), see indic refs.]

[For f.p./compn. data on system $\bar{C}+o$ -chlorobenzoic acid (3:4150) (eutectic, m.p. 110.7°, contg. 47–48 mole % \bar{C} (20) (27) (8) (19)) see indic. refs.; on system $\bar{C}+p$ -chlorobenzoic acid (3:3940) (eutectic, m.p. 140.9°, contg. 80 mole % \bar{C} (8) (19) cf. (104)) see indic. refs.; on system $\bar{C}+2$,5-dichlorobenzoic acid (3:4340) (eutectic, m.p. 119.7°, contg. 51–58 mole % \bar{C}) see (13).]

[For f.p./compn. data on systems $\bar{C} + o$ -bromobenzoic acid (28), $\bar{C} + m$ -bromobenzoic acid (28), $\bar{C} + p$ -bromobenzoic acid (28), m-iodobenzoic acid (29), o-nitrobenzoic acid (30), m-nitrobenzoic acid (30) see indic. refs.]

Ternary systems contg. \bar{C} : [For influence of addn. of benzoic acid (20) or of p-chlorobenzoic acid (3:4940) (27) to eutectic of \bar{C} with o-chlorobenzoic acid (3:4150) see indic. refs. — For influence of addn. of o-chlorobenzoic acid (3:4150) to eutectic of \bar{C} with benzoic acid (1:0715) see (27); for data on system $\bar{C} + o$ -chlorobenzoic acid (3:4150) + p-chlorobenzoic acid (3:4940) see (19).]

Miscellaneous. [For study of fate of \bar{C} in animal organism see (31) cf. (102) (note that although from man \bar{C} is excreted (34) as N-(m-chlorobenzoyl)glycine (m-chlorobippuric acid) [Beil. IX-339], m.p. 143-144° (31), yet from dog and rabbit no evidence for this conjugation product has been found (31). — For study of use of \bar{C} as a preservative see (32). — For use of \bar{C} as vulcanization regulator see (33)

Preparation. [For prepn. of \bar{C} from benzoic acid (1:0715) by chlorination with Cl₂ (38) in pres. of FeCl₃ (70% yield (8)), with KClO₃ + conc. HCl (35) (36) (37) (38), with aqua regia at 100° (yield 32% (39)) (7), with SbCl₅ (35) (40) (84), with MnO₂ + conc. HCl in s.t. at 150° (41), with NaOCl soln. (20) (42), or with Ca(OCl)₂ soln (42) (35) (38) see indic. refs. (note that in all these cases numerous other chlorination products are also formed); from cinnamic acid (1:0735) by chlorination and oxidn with Ca(OCl)₂ soln. see (35) (38).]

[For prepn. of \bar{C} by oxidn. of *m*-chlorotoluene (3:8275) with $K_2Cr_2O_7 + H_2SO_4$ (43), with 5% aq. KMnO₄ (75% yield (4)) (8), with dil. HNO₃ in s.t. at 130-140° for 8 hrs. (47), or in aq. alk. at 260° under press. with air (44) see indic. refs.; from 3-chlorobiphenyl (3:8940) or from 3,3'-dichlorobiphenyl (3:0180) by oxidn. with $CrO_3/AcOH$ in pres of V_2O_5 see (45); from *m*-chlorobenzaldehyde (3:6475) by oxidn. with alk KMnO₄ see (3).]

[For prepn. of C from m-chlorobenzal (di)chloride (3:6710) by hydrolysis with aq. followed by KMnO₄ oxidn. (7% yield (2)) or from its mixt. with m-chlorobenzotrichloride (3:6845) by hydrolysis with 70% H₂SO₄ or 80% AcOH or 5% NaOH at 90-100° in stream of air to effect immediate oxidn. (46) see indic. refs.]

[For prepn. of \bar{C} from *m*-chlorobenzonitrile [Beil. IX-339], m.p. 40.5° (48), by hydrolysis with conc. H₂SO₄ (3), from *N*-(*m*-chlorobenzoyl)glycine (*m*-chlorohippuric acid) by hydrolysis with HCl (35) (36), see indic. refs.]

[For prepn. of C from m-aminobenzoic acid [Beil. XIV-383, XIV₁-(558)] via dizactization and use of Cu_2Cl_2 reactn. (74% yield (101)) (3) (4) (49); from m,m'-diazoaminobenzoic acid (diazoaminobenzene-3,3'-dicarboxylic acid) [Beil. XVI-727] with warm conc. HCl (50) see indic. refs.]

[For form. of \tilde{C} from *m*-chloro-iodobenzene [Beil. V-220, V₂-(167)] by reaction with *n*-butyllithium in ether followed by carbonation with CO₂ (41.5% yield (51)); from *p*-chloronitrobenzene [Beil. V-243, V₁-(129), V₂-(182)] with alc. KCN in s.t. at 200° (52); from 3-chlorophthalic acid (3:4820) or 4-chlorophthalic acid (3:4390) by cat. partial decarboxylation (53); from 3-chlorophthalic acid by mercuration and treatment with HCl (99) see indic. refs.]

Chemical behavior. [\overline{C} (as Na \overline{A}) on reduction in boilg. aq. soln. with Na/Hg yields (36) (54) benzoic acid (1:0715) (for study of reduction of \overline{C} with H₂ + Ni in aq. alk. at ord. temp. see (55)); \overline{C} on electrolytic reduction in alc./H₂SO₄ yields (56) m-chlorobenzyl

alcohol [Beil. VI-444], oil, b.p. 234° (56); note that \bar{C} with Ni/Al alloy (Raney nickel) in aq. alk. soln. at 90° gives (100% yield (106)) benzoic acid (1:0715), m.p. 121°.]

 \bar{C} behaves normally as a monobasic acid: e.g, \bar{C} on titration with standard dil. aq. alk. gives Neut. Eq. 156.5; ionization const. at 25° is 1.55 \times 10⁻⁴ (57), 1.53-1.59 \times 10⁻⁴ (58), 1.506 \times 10⁻⁴ (59) cf. (1) (60). — [For study of acid strength of \bar{C} in MeOH, EtOH, and various other alcs. see (61) (62) (63) (16) (64) (65) (17).]

Salts of inorganic bases. [NH₄ $\bar{\Lambda}$, m.p. 203–204° dec. (39), lfts. from acetone/pet. ether (39), powder from abs. alc. (66). — Hydroxylamine salt, ndls. from xylene, m.p. 144° (72), 145–146° dec. (39). — Na $\bar{\Lambda}$ (67), K $\bar{\Lambda}$ (67) both behave as liquid cryst. on fusion. — Ag $\bar{\Lambda}$, insol. aq. (68) (note that this salt (1 mole) with I₂ (2 equiv.) in dry C₆H₆ refluxed 15–18 hrs. yields (69) phenyl *m*-chlorobenzoate, m.p. 53°, + CO₂ + AgI). — Ca $\bar{\Lambda}$ 2.3H₂O, sol. at 12° in 82 6 pts. aq. (68) (35). — Ba $\bar{\Lambda}$ 2.4H₂O, eas. sol. aq. or alc. (for use in sepn. of \bar{C} from σ -chlorobenzoic acid (3.4150) and ρ -chlorobenzoic acid (3:4940) see (27)). — Cd $\bar{\Lambda}$ 2.2H₂O (71).]

Salts of organic bases. E.g., C with equiv. amt. benzylamine in boilg. EtOAc followed by evapn. of solvent yields (73) benzylammonium m-chlorobenzoate, m.p. 146.8-147.4° u.e., 149 2-149.8° cor. (73), Neut. Eq. 263.6 (note that the m.p. of this salt is only very slightly lower than that of the corresp. salt from o-chlorobenzoic acid (3:4150)). — C similarly treated with a-phenylethylamine yields (73) a-phenylethylammonium m-chlorobenzoate, m.p. 142.0-142.6° u.e., 144 7-145.3° cor. (73), Neut. Eq. 277.6 (note that the m.p. of this salt, although better separated from those of the isomeric acids than the preceding case, is very close to that for the corresp. deriv. of cinnamic acid (1:0735)).

 $\bar{\rm C}$ (1 mole) in alc. mixed with codeine (1 mole), m.p. 155°, in alc. htd. several minutes, solvent evaporated, and resulting syrup recrystallized from aq. yields (74) codeine m-chlorobenzoate, ${\rm C}_{18}{\rm H}_{21}{\rm O}_3{\rm N.\bar{C}}$, m.p. 96° on "Maquenne block"; note that this m.p. although very close to that (99°) of corresp. salt from m-bromobenzoic acid is widely different from the corresp. salts of o-chlorobenzoic acid (3:4150) and p-chlorobenzoic acid (3:4940), which are 134° and 162° respectively. — $\bar{\rm C}$ (1 mole) in alc. (or CHCl₃) with strychnine (1 mole) in alc. bouled for a few minutes then cooled yields (75) strychnine m-chlorobenzoate, ${\rm C}_{21}{\rm H}_{22}{\rm O}_2{\rm N}_2.\bar{\rm C}$, m.p. 185° u.c. on "Maquenne block"; note that this m.p. is somewhat higher than that (170°) of the corresp. salt from o-chlorobenzoic acid (3:4150) and widely different from that (251°) of the corresp. salt of p-chlorobenzoic acid (3:4940).

 \bar{C} with alcohols gives by conventional procedures the corresp esters; for details on methyl m-chlorobenzoate (3:6670) and on ethyl m-chlorobenzoate (3:6770) see these compds. — [For study of rate of esterification of \bar{C} with MeOII (76) or with cyclohexanol (77) see indic. refs.]

 \bar{C} with P_2O_5 in toluene boiled for 4 hrs. (78) or \bar{C} with oxalyl (di)chloride (3:5060) refluxed in C_6H_6 (79) cf. (80) yields m-chlorobenzoic acid anhydride, pl. from C_6H_6 or toluene, ndls. from lt. pet. or alc., m.p. 95.5° (78), 95° (79) (note that \bar{C} (2 moles) with oxalyl (di)bromide refluxed in C_6H_6 similarly gives good yields (80) of the above anhydride but $Na\bar{A}$ with oxalyl dibromide can also be used (80) to prepare m-chlorobenzoyl bromide, oil, b.p. 143-147° at 40 mm. (80)).

 \overline{C} with PCl₅ (31) (68) (3) or with SOCl₂ (81) (82) or with SOCl₂ + pyridine (83) gives (76% yield (31)) m-chlorobenzoyl chloride (3:6590), b.p. 225°.

[\tilde{C} with HN_3 in conc. H_2SO_4 in trichloroethylene (3:5170) soln. at 40° gives (75% yield (107)) m-chloroaniline.]

C fused with KOH, subsequently acidified, yields (84) m-hydroxybenzoic acid (1:0825).

C on nitration with boilg. fumg. HNO₃ for 10 min. (70) or with abs. HNO₃ at 0° or -30° (3) (24) (85) gives a mixt. of two isomeric nitro-m-chlorobenzoic acids; this mixt. consists mainly (92-93% (86) cf. (24)) of 3-chloro-6-nitrobenzoic acid [Beil. IX-401],

cryst. from HNO₃ (D=1.1) (24), ether, C₆H₆, or aq., m.p. 139° (85), 137–138° (70), 136° (3), 135–136° (24), accompanied by a little (7–8% (86)) cf. (24) 3-chloro-2-nitrobenzoic acid [Beil. IX-400], ndls. or tbls. from hot aq., m.p. 235° (70) (85), 233–234° (3) (for details on sepn. of these two isomers see (3) (70) (24) (85)). — Note that the other two possible nitro-m-chlorobenzoic acids are known but are not found in the product from nitration of \bar{C} ; they are 3-chloro-4-nitrobenzoic acid [Beil. IX-404], m.p. 185–186°, and 3-chloro-5-nitrobenzoic acid [Beil. IX-403, IX₁-(165)], m.p. 147°. — [Note also that no dinitro-3-chlorobenzoic acids have ever been reported.]

- Methyl m-chlorobenzoate: b.p. 231°, m.p. 21°. (See 3:6670.)
- Ethyl m-chlorobenzoate: b.p. 245°. (See 3:6770.)
- D p-Nitrobenzyl m-chlorobenzoate: m.p. 107 2° u.c. (87). [From C (as NaA) with p-nitrobenzyl bromide (m.p. 99°) in boilg. dil. alc. (87); note that m.p. of this ester is almost identical with that (106° (88)) of the corresp. ester of o-chlorobenzoic acid (3:4150).]
- D Phenacyl m-chlorobenzoate: m.p. 118° (89), 116.4° (21). [From C (as NaA) with phenacyl bromide (m.p. 50°) in boilg. alc. (98% yield (21)).]
- --- p-Chlorophenacyl m-chlorobenzoate: unreported.
- D p-Bromophenacyl m-chlorobenzoate: m.p. 117.2° (21), 116° (90). [From C (as NaA) with p-bromophenacyl bromide (m.p. 109°) in boilg. alc. (21).]
- --- p-Iodophenacyl m-chlorobenzoate: unreported.
- p-Phenylphenacyl m-chlorobenzoate: m.p. 154° u c. (91). [From C (as NaA) with p-phenylphenacyl bromide (m.p. 126°) in boilg. alc. (91); note that the m.p. of this deriv. is only slightly lower than that (160° u.c. (91)) of the corresp. ester of p-chlorobenzoic acid (3.4940); note also that, since this ester has almost the same m.p. as the original C, care must be taken to show that the supposed ester is insol. in aq. Na₂CO₃ (dif. and sepn. from C); note finally that the m.p. of a mixt. of C with this ester is depressed to 130-132° (91).]
- ⑤ S-(p-Chlorobenzyl)thiuronium m-chlorobenzoate: cryst. from dioxane, m.p. 157° cor. (93). [From NaĀ or KĀ in aq. with 1 equiv. of S-(p-chlorobenzyl)thiuronium chloride, m.p. 197° (10% in alc.) (93); note that the m.p. of this prod. is closely adjacent to that (m.p. 159° cor. (93)) of the corresp. salt of o-chlorobenzoic acid (3:4150), and is also almost identical with that of the original C.]
- S-(p-Bromobenzyl)thiuronium m-chlorobenzoate: m.p. 150° cor. (94). [From NaA or KA in aq. with 1 equiv. of S-(p-bromobenzyl)thiuronium bromide, m.p. 213°, in alc. (94).]
- m-Chlorobenzamide: cryst. from hot aq. or alc., m.p. 135° (100), 134.5° cor. (3), 134° u.c. (95), 132-133° (70). [From o-chlorobenzoyl chloride (3:6590) with conc. aq. NH₄OH (68) (70) or from Č by refluxing with AcOH + (NH₄)₂CO₃ (46-50% yield (100)); note that this amide gives on fusion with HgO a mercuric deriv., m.p. 245° u.c. (95).]
- ① m-Chlorobenzhydrazide: ndls. from aq. or alc., m.p. 158° (96), 157-158° (97). [From ethyl m-chlorobenzoate (3:6770) with hydrazine hydrate in abs. alc. on 8-hr. reflux. (yield: 97% (96), 87% (97)).] [For use of m-chlorobenzhydrazide as general reagt. for identification of aldehydes and ketones see (97).]
- -----N'-(m-Chlorobenzoyl)-N-phenylhydrazide: unreported.

- —— m-Chlorobenzanilide: cryst. from alc., m.p. 122-125° (98). [Prepn. reported but only by indirect means (98).] [Note that the isomeric benz-m-chloroanilide [Beil. XII-605] has m.p. 118°.]
- ---- m-Chlorobenzo-p-toluidide: unreported.
- m-Chlorobenzo- α -naphthalide: unreported.
- ---- m-Chlorobenzo-β-naphthalide: unreported.

3:4395 2-CHLORO-3-HYDROXYBENZOIC ACID

COOH C7H5O3Cl Beil. X - 142 \mathbf{X}_{1} —

M.P. 157.5-158.5° (1) 156.5-157.5° (1) 156-157° (2) (5)156° (3) 155.0-155.5° u.c. (10)

Colorless lfts. from aq. or C_6H_6 . [Ioniz. const. at $25^\circ = 1.40 \times 10^{-3}$ (5).]

For prepn. of C from 2-chloro-3-hydroxybenzaldehyde (3:4085) with 5-6 pts. 50% KOH at 60-70° (Cannizzaro reactn.) (96% yield) see (3); from ethyl 2-chloro-3-hydroxybenzoate (see below) by hydrolysis with 35% KOH see (1) (2) cf. (4); for formn. from m-hydroxybenzoic acid (1:0825) with Cl₂ in McOH (6) (44% yield (10)) or AcOH (1) (together with some of the isomeric 6-chloro-3-hydroxybenzoic acid (3:4720)) see indic. refs.; for prepn. of C from 2-amino-3-hydroxybenzoic acid (1) via diazotization and use of Cu₂Cl₂ reactn see (1).]

Salts: AgA, cryst. ppt. (2).

C in aq. soln. gives with FeCl₃ a violet-red color.

[C with formalin (1:0145) + conc. HCl + HCl gas at room temp, gives (87% yield (10)) 7-chloro-6-hydroxyphthalide, m.p. 290° cor. (10)]

- Methyl 2-chloro-3-hydroxybenzoate: pr. with 1 H₂O from dil. alc., m.p. 70-71° (2); anhydrous form, m.p. 62-65° (2). [From \bar{C} in MeOH with H_2SO_4 (2)] — [This ester with MeI + MeOH/KOH in s.t. at 130° for several hours gives methyl 2-chloro-3-methoxybenzoate, anhydrous ndls. from dil. alc., m.p. 41-42° (2).]
- Ethyl 2-chloro-3-hydroxybenzoate: white ndls. with 1 H₂O from dil. alc., m.p. 58° (2); above m.p. loses aq. giving viscous oil (2). [From ethyl m-hydroxybenzoate (1:1471) with SO₂Cl₂ (together with the isomeric ethyl 6-chloro-3-hydroxybenzoate (2) (4)).] — [This anhydrous ester with AcCl yields ethyl 2-chloro-3-acetoxybenzoate, ndls. from dil. alc., m.p. 48-49° (2).]
- 2-Chloro-3-methoxybenzoic acid: colorless ndls. from aq., m.p. 161.5° (7), 160° (8) (9). [Prepd. indirectly from 2-chloro-3-methoxybenzaldehyde by oxidn, with KMnO₄ (7) (8).]

—— 2-Chloro-3-acetoxybenzoic acid: cryst. from aq. or C_6H_6 , m.p. 152.5-153° u.c. (10). [From $\tilde{C} + Ac_2O + K_2CO_3$ (10).]

3:4400 3,5-DICHLORO-4-HYDROXYBENZ-ALDEHYDE

Colorless odorless ndls. from dil. alc. or from CHCl₃; fairly eas. sol. alc., ether, AcOH; more dif. sol. C₆H₆, lgr., CHCl₃.

[For prepn. of \tilde{C} from p-hydroxybenzaldehyde (1:0060) in 5 pts. AcOH at 100° (2) (4) or in CHCl₃ with cooling (1) with Cl₂ see indic. refs.; from corresp. methyl ether (3,5-dichloro-4-methoxybenzaldehyde) with boilg cone HI see (3)

 \bar{C} in N KOH with H_2O_2 yields (4) 2,6-dichlorohydroguinone (3:4600)

[The methyl ether of \bar{C} (see above) has been obtd indirectly (3) from p-methoxybenzaldehyde (p-anisaldehyde) (1:0240) by chlorination with large excess (9 moles) SO₂Cl₂; bright red cryst. from alc., m.p. 61.5° (3); on oxidin. with CrO₃ this prod. gives (80% yield (3)) 3,5-dichloro-p-methoxybenzoic acid [Beil. X-177], m.p. 202.0-202.5° (3)]

- ③ 3,5-Dichloro-4-hydroxybenzaldoxime: colorless ndls. from dil. alc., m.p. 185° (2).
 [From C̄ in moderately conc. NaOH (3 moles) with NH₂OH.HCl (1½ moles), subsequently acidified with AcOH (2)] [This oxime on boilg, with Ac₂O for 2 hrs. yields (2) 3,5-dichloro-4-acetoxybenzonitrile, colorless cryst. from dil. alc., m.p. 93° (2).]
- ⊕ 3,5-Dichloro-4-hydroxybenzaldehyde semicarbazone: greenish yel. ndls. from AcOH, m.p. 236-237° cor. dec (1). [From C in hot AcOH (50 pts.) by addn. of conc. aq. soln. of semicarbazide hydrochloride, followed by ½ hr. htg. (1).]

3:4400 (1) Biltz, Ber. **37**, 4033-4034 (1904). (2) von Auwers, Reis, Ber. **29**, 2356-2358 (1896). (3) Durrans, J. Chem. Soc. **123**, 1426 (1923). (4) Dakin, Am. Chem. J. **42**, 490-491 (1909).

3:4410 cis-1,2,3,4,5,6-HEXACHLORO-CYCLOHEXANE

(a-Benzenehexachloride)

[See also β -benzenehexachloride (3:4990).]

Nine stereoisomeric configurations of benzenehexachloride are possible (cf. (4)) and four are known; \bar{C} (contrary to earlier opinion (5)) is now thought (but not unequivocally proved) to have the crs configuration; the β -isomer has been shown to have the trans configuration; the configurations of the γ -isomer, m.p. 112-113° (2), and the δ -isomer, m.p. 129-132° (2), are unknown.

 \bar{C} cryst. from 80% AcOH (3) or from alc. — \bar{C} is volatile with steam (dif. and separation from β -isomer). — \bar{C} is insol. aq. but sol. in 22.8 pts. CHCl₃ at 15.25°; in 15.4 pts. C₆H₆ at 18.25° (5). — \bar{C} forms with the β -isomer a eutectic (m.p. 155.5°) contg. 79.7% \bar{C} (2).

[For manuf. of ordinary benzenehexachloride (mixt. of stereoisomers) from C_6H_6 (1:7400) + Cl_2 in pres. of light (6) (7) (8), X-radiation (9), or conc. H_2SO_4 (10) see indic. refs.; for study of prepn. of \bar{C} (together with other stereoisomers) from C_6H_6 with Cl_2 in pres. of 1% aq. NaOH see (3) (2) (28), in gas phase (11) (12), in pres. of ethylene in the dark (13), in pres. of NCl₃ in the dark (14) or in light (15), in pres. of light (16) (17) (18) (19) (20).] [For use of \bar{C} as insecticide see (27); note, however, that insecticidal props. are thought to be due to γ -isomer (29).]

C on htg above its m.p. loses HCl and yields (3) (21) 1,2,4-trichlorobenzene (3:6420).

C on htg. with aq. in s.t. at 200° (19), on boilg. with MeOH/KOH (2), EtOH/KOH (2) (3) (19) (20) (22), alc. KCN (19), or pyridine (2), or on htg. with quinoline at 105–110° (2) yields mainly 1,2,4-trichlorobenzene (3:6420) together with other prods.; e.g., C on boilg. with excess 10% alc. KOH for ½ hr. (2) or C boiled with 10 pts. pyridine for 1 hr. (2) gives (yield: 75–86% (2)) 1,2,4-trichlorobenzene (3:6420).

C reacts very vigorously with boilg. aniline (19), but the prods. have not been detd.

[\bar{C} stood in s.t. with 3 pts. liq. Cl₂ for 11 days yields (23) α -nonachlorocyclohexane, cryst. from alc., m.p. 95-96° (23) (24).]

C in alc. boiled with Zn dust yields (25) benzene (1:7400).

Č is very inert to most other reagents: e.g., Č can be recrystallized unchanged from fumg. HNO₃ (3), is unattacked by fumg. H₂SO₄ (19), is unattacked by C₁O₃ (3), is only slightly affected by aq. KMnO₄ even on boilg. (3), and is unaffected by conc. aq. NH₄OH (3), boilg. alc. AgNO₃ (3), or AgOAc (26).

3:4420 4,8-DICHLORONAPHTHOL-2

M.P. 158-159° (1).

Colorless ndls. from alc. — sol. in NaOH.

[For prepn. from 4,8-dichloronaphthylamine-2 via diazo reaction see (1).]

[For use in prepn. of azo dyestuffs see (2).]

Č on suitable methylation yields methyl ether, viz., methyl 2,4-dichloro-β-naphthyl ether, colorless ndls., m.p. 93° (1).

3:4420 (1) Friedlander, Karamessinis, Schenk, Ber. 55, 48-49 (1922). (2) Herzberg, Wunderlich (to I.G.), Ger. 459,989, May 18, 1928; Cent. 1928, II 395.

3:4430 2-CHLORO-4-HYDROXYBENZOIC ACID

M.P. 159° (1)

Colorless ndls. from aq.

[For prepn. of \tilde{C} from 2-chloro-4-methoxybenzoic acid (see below) by cleavage with conc. HI (D=1.7) see [1].]

[The corresp methyl ether, viz., 2-chloro-4-methoxybenzoic acid (2-chloro-p-anisic acid), mp 208° (2) (3), has been obtd. indirectly from 2-chloro-4-methoxybenzaldehyde [Beil VIII-81] (2) or from 2-chloro-4-methoxytoluene [Beil. VI-402] (3) by KMnO₄ oxidn. (2) (3) |

3:4435 3-CHLORO-2-METHYLBENZOIC ACID

COOH CH₃ C₈H₇O₂Cl Beil. IX - 467 IX₁—

M.P. 159° (1)

156° (2) 154° (3)

Colorless ndls. from alc.; eas. sol alc.

[For prepn. of \bar{C} from 3-chloro-2-methylbenzonitrile, m.p. 19° (1), by refluxing with 20% aq. KOH for 5 hrs. (98% yield) see (1); from 3-chloro-1,2-dimethylbenzone (3:8645) on oxidn. with boilg. dil. HNO₃ (D=1.20) see (3); from 2-methylbenzoic acid (o-toluic acid) (1:0690) in CHCl₃ in pres of Fe with Cl₂ (4) or in AcOH with Cl₂ (2) see indic. refs.] Salts: Ca \bar{A}_2 .2H₂O, spar. sol. hot aq. (3).

C on oxidn. with KMnO₄ gives (3) 3-chlorophthalic acid (3:4820)

3:4435 (1) Noelting, Ber. 37, 1025-1026 (1904). (2) Claus, Bayer, Ann. 274, 310-311 (1893). (3) Krüger, Ber. 18, 1758 (1885). (4) Claus, Stapelberg, Ann. 274, 311 (1893).

3:4444 3,5,6-TRICHLORO-2-HYDROXYHYDROQUINONE

M.P. 160° (1)

Ndls. from C_6H_6 . — \tilde{C} cryst. from C_6H_6 or AcOH in solvated form. \tilde{C} is eas. sol. alc., ether; spar. sol. pet. ether.

[For prepn. of \bar{C} from 3,5,6-trichloro-2-hydroxybenzoquinone-1,4 [Beil. VIII-238] by reduction with aq. SO_2 see (1).]

 \bar{C} dis. in aq. yielding colorless soln. which on htg. develops violet color; \bar{C} with aq. alk. gives deep green color changing to brown (1).

- ---- 3,5,6-Trichloro-2-hydroxyhydroquinone trimethyl ether: unreported.
- ---- 3,5,6-Trichloro-2-hydroxyhydroquinone triethyl ether: unreported.
- 3,5,6-Trichloro-2-hydroxyhydroquinone triacetate: ndls from $\lg r./C_6H_6$, m.p. 171° (1). [From \bar{C} with $Ac_2O + NaOAc$ on htg. (1).]

3:4444 (1) Zincke, Schaum, Ber. 27, 557-558 (1894).

M.P. 160°? (1) B.P. 268-269° at 734 mm. (1)

White extraordinarily pliable (2) crystals, difficult to filter with suction (because of their high vapor pressure (3)) and best purified by fractional distn (3) or slow sublimation in vac (2). — Very sol. in alc., ether, or lgr. (1).

[For prepn. of $\bar{\mathbf{C}}$ (100% yield (3)) from 1,1,1,2,2,3,3-heptachloropropane (3:0200) by conversion with MeOH/KOH by loss of HCl to 1,1,1,2,3,3-hexachloropropenc-2 (3:6370) and subsequent treatment with Cl₂ below 50° in sunlight see (3) (2) [For formn from 1,2,3-trichloropropane (3:5840) or from isobutyl chloride (3:7135) with excess ICl₃ at 200° see (1).]

Č on htg. at 300° (1) or on htg. with AlCl₃ (2) splits quantitatively (2) into CCl₄ (3:5100) + tetrachloroethylene (3:5460).

[For fluorination of \bar{C} see (3) (4); for use of \bar{C} + Zn for production of smoke see (5) (6).]

$C_6H_2O_2Cl_2$ 3:4470 2,5-DICHLOROBENZOQUINONE-1,4 Beil. VII - 632 (p-Dichlorobenzoquinone) VII₁-(346) M.P. 161-162° (1) 160.4-161.4° (2) 161° u.c. (3) 161° (4) (17) (28) 159° (5) (10)158.5° (6) 158-161° (7)

[See also 2,5-dichlorohydroquinone (3:4690).]

Dark yellow cryst. from alc. or C₆H₆; insol. aq.; alm. insol. cold dil. alc., eas. sol. boilg. abs. alc.; fairly eas. sol. other or CHCl₃. — Volatile with steam; sublimes in vacuum.

[For prepn. of C from 2,5-dichlorohydroquinone (3:4690) by oxidn. with K₂Cr₂O₇ or

 $Na_2Cr_2O_7$ + dil. H_2SO_4 (2) (4) (6) (8) (9) or with conc HNO₃ at ord. temp. (5) see indic. refs.; from 2,5-dichlorohydroquinone dimethyl ether with fumg. HNO₃ in the cold see (1); from 2-chlorobenzoquinone-1,4 (3:1100) via conversion with HCl to 2,5-dichlorohydroquinone (3:4690) and subsequent oxidn. of latter see (5) (17); from 2,5-dichloroaniline [Beil. XII-625, XII₁-(311)] with CrO_3 (5) or from 2,5-dichloro-p-phenylenediamine [Beil. XIII-118] with CrO_3 (10) or $K_2Cr_2O_7$ + dil. H_2SO_4 (28) see indic. refs.; for formn. of \bar{C} from benzoquinone-1,4 (1:9025) in CCl_4 with ICl on gentle warmg. see (3); from benzene with ClO_2 see (11); from copper salt of quinic acid [Beil. X-535, X_1 -(270)] by oxidn. with MnO_2 + NaCl + H_2SO_4 see (12)]

[For study of oxidn -reductin potential of system $\bar{C}+2.5$ -dichlorohydroquinone (3:4690) see (6) (13) (14).] — [For use as vulcanization accelerator see (15); for use in prepn. of eurhodol dyes see (16); for study of bactericidal actn. see (18).]

 $[\bar{C} \text{ is sol. in conc. } H_2SO_4 \text{ with greenish-yellow color, in dimethylaniline with deep blue color (19); <math>\bar{C} \text{ is sol. in dil. } aq. \text{ alk. } \text{with brown color and decomposition (11) (12).}]$

[\bar{C} with KCN in 85% MeOH gives (20) a ruby-red soln. with red fluorescence; \bar{C} with diphenylketene in ether + pet. eth. gives a compound, m.p. 180-192° dec. (21).]

Č in aq reduces with SO₂ (12) to 2,5-dichlorohydroquinone (3:4690) q.v. (note that the intermediate quinhydrone, dark violet pr. or greenish-black ndls. with 2 H₂O (12), crystal water lost over H₂SO₄ or on warming giving yellow anhydrous form, m.p. 140−145° (22), is known); however, Č in dil aq. NaOH (under N₂) treated with SO₂ is in part reduced to 2,5-dichlorohydroquinone (3:4690) and in part sulfonated to mono- and disulfonic acids of Č (23).

[\bar{C} in CHCl₃ at low temps, does not react with Cl₂; at ord, temps, however, yields tetrachlorobenzoquinone-1,4 (chloranil) (3:4978) (24). — \bar{C} in AcOH at 70–80° with 2 moles Br₂ gives (alm quant. yield (4)) (25) (9) 2,5-dichloro-3,6-dibromobenzoquinone-1,4 [Beil. VII-642], golden-brown tbls. from C₆H₆, m p. 292° (4).]

[Č with conc. HCl gives on boilg. (5) 2,3,5-trichlorobenzoquinone-1,4 (3:4672), but some tetrachlorobenzoquinone (chloranil) (3:4978) is also formed.]

 \bar{C} (1 pt.) in $\Lambda c_2 O$ (5 pts.) + AcOH (5 pts.) loses color on boilg. with Zn dust (1) and yields (by reductive acylation) 2,5-dichlorohydroquinone diacetate, cryst. from alc, m.p. 141° (1).

Č (1 pt) in hot AcOH (40 pts.) + conc. HCl (0 4-0.5 pt) treated with aniline (0.4-0.5 pt.) yields mainly (26) 2,5-dichloro-3-anilinobenzoquinone-1,4 [Beil. XIV-137], blue lfts., m.p. 180° (26), and 2,5-dichlorohydroquinone (3:4690) accompanied by small amts. of 2,5-dichloro-3,6-dianilinobenzoquinone-1,4 (see below); Č htd. with excess aniline yields (26) 2,5-dichloro-3,6-dianilinobenzoquinone-1,4 [Beil. XIV-144], yel.-br. tbls. from C₆H₆, m.p. 290° (26), and 2,5-dichlorohydroquinone (3:4690)

 $|\bar{C}|$ in C_6H_6 + alc. warmed with slightly more than 1 mole $NH_2OH.HCl$ yields (8) (27) 2,5-dichlorobenzoquinone-1,4 monoxime (2,5-dichloro-4-nitrosophenol) [Beil. VII-633], pale yel. cryst from C_6H_6 , m.p. 155–160° (8) (purified by conv. with Ac_2O + NaOAc to its acetate, yel. pr from C_6H_6 , m.p. 149° (8), and subsequent hydrolysis with NaOH) — \bar{C} in alc. with excess $NH_2OH.HCl$ yields (27) 2,5-dichlorobenzoquinone-1,4 dioxime, grayish yel. cryst. from C_6H_6 , m.p. not stated (27).]

[See also 2-chloroanthraquinone (3:4922).]

Yellow ndls. from C_6H_6 , toluene, or alc.; eas. sol. C_6H_6 , toluene, AcOH, nitrobenzene, or AmOH on htg.; spar. sol. alc. or lgr.

[For f.p /compn. data and diagram of system $\tilde{C}+2$ -chloroanthraquinone (3:4922) (eutectic, m.p. 143.9–144.2°, contg about 25% \tilde{C}) see (14).]

[For use in coloring oils, fats, and waxes see (19); \tilde{C} is very widely used as intermed. in prepn. of many dyestuffs, but no general summary can be given here although selected examples occur in the following text.]

[For prepn. of \bar{C} from potassium salt of anthraquinonesulfonic acid-1 [Beil. XI-335, XI₁-(81)] by htg. with strong HCl + NaClO₃ (yields: 97–98% (3), 95% (4)) at 100° (3) (4) (10) (6) (8) (for use of this method in detn. of mixt. of anthraquinone- α - and β -sulfonic acids or their salts by f.p./compn. curve of resultant mixt. of \bar{C} + 2-chloroanthraquinone (3:4922) see (4)) or by actn. of Cl₂ at 100° (20) see indic. refs.; from anthraquinonesulfonic acid-1 (9) or its Na salt (15) in dil. HCl on exposure to light see indic. refs.; from anthraquinonecarboxylic acid-1 with HCl + KClO₃ in s.t. at 200° for 12 hrs. see (22); from Na salt of anthracenesulfonic acid-1 [Beil. XI-194, XI₁-(44)] with HCl + NaClO₃ at 100° see (21); from 1-chloroanthraquinonesulfonic acid-5 by electrolysis of alk. soln. see (23); from K salt of anthraquinonesulfonic acid-1 (see above) (24) or from anthraquinonesulfonyl chloride-1 (5) by htg. in s.t. with SOCl₂, or from 1-anthraquinonylarsinic acid by 10 hrs. reflux with SOCl₂ (67), see indic. refs.]

[For prepn. of \bar{C} from 2-benzoyl-3- (or 6)-chlorobenzoic acid by ring closure with conc. H_2SO_4 see (7) (25).]

[For prepn. of C from 1-aminoanthraquinone (see below) via diazotization and use of Cu₂Cl₂ reactn. see (26); from 1-nitroanthraquinone [Beil. VII-791, VII₁-(415)] with Cl₂ in trichlorobenzene soln. at 160-165° see (27); from 1-hydroxyanthraquinone [Beil. VIII-338, VIII₂-(650)] with PCl₅ in boilg. nitrobenzene see (28).]

[\bar{C} on htg. with conc. H₂SO₄ at 200-205° for 9 hrs. rearr. (29) to 2-chloroanthraquinone (3:4922).]

[C on reductn. with Zn dust + conc. aq. NH₄OH under reflux yields (30) 1-chloroanthracene [Beil. V₁-(324)], colorless lfts. from AcOH, m.p. 81-82° (2), 79° (30). — C on reductn. with hydrazine hydrate in MeOH/KOH at 10 atm. and 135° for 1½ hrs. in pres. of Pd/CaCO₃ followed by access of air to the prod. gives (87% yield (31)) anthraquinone (1:9095). — C on reductn. with Al powder + conc. H₂SO₄ (32) (33) (6) (34) yields 1-chloroanthrone-9, yel. ndls. from CHCl₃ + lt. pet., m.p. 118° (32), 114° (6); C on reductn. with Sn + HCl in AcOH contg. PtCl₄, however, gives the isomeric 4-chloroanthrone-9, yel. ndls. from CHCl₃ + lt. pet., m.p. 118° (32) (note that although these two isomeric chloroanthrones have the same m.p. yet each depresses the m.p. of the other (32) and the earlier prod. of m.p. 106° (33) may have been a mixture). — For studies of oxidn.-reductn. potential of C see (12) (17).]

[C with MeOH/KOH at 80° yields (35) 1-methoxyanthraquinone [Beil. VIII-339, VIII₁-(651)], m.p. 169.5° — C with 2-hydroxyanthraquinone + NaOAc + Cu powder in boilg. nitrobenzene gives (36) 1,2'-dianthraquinonyl ether [Beil. VIII-343], but m.p. is not reported. — C with K xanthate + Cu powder boiled for 24 hrs. in AmOH or C with alk. trithiocarbonate in boilg. nitrobenzene (40) gives (64% yield (37)) di-(1-anthraquinonyl) sulfide, red pr. from pyridine, m.p. 321.5° (37) (for disulfide see below). — C with thiosalicylic acid (2-mercaptobenzone acid) + solid KOH htd. in AmOH at 150° for 7 hrs. gives (96% yield (38)) S-(1-anthraquinonyl)thiosalicylic acid [Beil. X₁-(55)], or.-yel. tbls. from alc., m.p. 261° cor. (38); this prod. on htg. with PCl₅ in nitrobenzene gives (98% yield (38)) 3,4-phthalylthioxanthone [Beil. XVII₁-(290)], or.-red lfts., m.p. 346° cor. (38).]

[\bar{C} with NaOH + glycerol htd. at 190° is claimed (39) to yield anthraquinone (1:9095). — \bar{C} on boilg. with aq. alc. Na₂S (41) or Na₂S_x (42) yields 1-mercaptoanthraquinone [Beil. VIII₁-(652)], yel. ndls. from AeOH, m.p. 187° (41); this prod. on oxidn. by air (43) or with K₃Fe(CN)₆ (44) or FeCl₃ (45) readily yields di-(1,1'-dianthraquinonyl) disulfide, m.p. 359° (45), also obtd. from \bar{C} with Na₂S + S in boilg. alc. (46) (43) (42) or from \bar{C} + K thiobenzoate in boilg. AmOH (80% yield (48)). — \bar{C} with K₂Se in dil. alc. at 80° gives (47) 1-selenomercaptoanthraquinone, or.-red lfts. from AeOH, m.p. 212°, and also di-(1-anthraquinonyl) diselenide.]

[C with conc. aq. NH₄OH in pres of Cu salts under press. at elevated temp. gives (49) (50) (57) in alm. quant. yield 1-aminoanthraquinone [Beil. XIV-177, XIV₁-(436)], red ndls., m.p. 242°. — Countless other analogous combinations of C with prim. and sec. amines cannot be included here; however, note that C with 1-aminoanthraquinone (above) + NaOAc + CuCl₂ htd. in nitrobenzene yields (52) cf. (61) di-(1-anthraquinonyl)amine [Beil. XIV-180, XIV₁-(439)], the prototype of a large group of dyes and dye intermediates (for amplification of this topic see (53)). — C with hydrazine hydrate + pyridine refluxed for ½ hr. gives (76% yield (54)) 1-hydrazinoanthraquinone [Beil. XV₁-(199)], dark br. lfts. from xylene, m p. 208.5° cor. (54). — For reactn. of C with NH₂OH.HCl in s.t. at 180° see (1).]

[For condens. of \bar{C} with p-aminoazobenzene (54) or with morpholine (60) and use of prods. as dyes for cellulose acetate see indic refs.; for condens. of \bar{C} with phthalonitrile in pres. of AlCl₃ for prepn. of dyestuffs see (55).]

[C with Cu powder at 290-300° or in boilg. nitrobenzene for 3 hrs. gives (75% yield (56)) bis-1,1'-anthraquinonyl [Beil. VII-903, VII₁-(494)], yel. or yel.-br. cryst. from nitrobenzene, m.p. 435° u.c. on Maquenne block (56); note, however, that in the pres. of NaOAc anthraquinone (1:9095) results (56). — C with 4 moles C₆H₆MgBr in boilg. ether for 4 hrs. gives (51% yield (58)) (57) 1-chloro-9,10-diphenylanthracene, yel. powder from AcOH, m.p.

185° (57), 180-182° (58); a mixt. of this prod. with corresp. prod. (m.p. 193°) from 2-chloroanthraquinone (3:4922) has m.p. 152-160° (58).]

[For formn. of addn. cpds. of \bar{C} with SbCl₅ in CHCl₃ see (16) (18); for formn. of 1-anthra-quinonylpyridinium chloride from \bar{C} + AlCl₃ in pyridine see (59).]

[C on mononitration by soln. in 10 wt. pts. cone. H₂SO₄ and addn. of HNO₃/H₂SO₄ as directed (61) (62) gives (30% yield (61)) 1-chloro-4-nitroanthraquinone [Beil. VII-792, VII₁-(415)], cryst. from AcOH, m.p. 260-261° (63), 259° (61); note that 1-chloro-2-nitroanthraquinone (prepared by indirect means) has m.p. 257-258° (63). — For study of kinetics of nitration of C see (64).]

 $|\bar{C}|$ on monosulfonation, e.g., with fumg. H_2SO_4 (20% SO_3) at 160° for 4 hrs. (65) (66), yields a mixt. of about equal parts of two monosulfonic acids eas. separable via their sodium salts; viz, 1-chloroanthraquinonesulfonic acid-6 (Na salt less sol. boilg. aq, corresp. sulfonyl chloride, pale yel. pr. from lgr., m.p. 207–208° dec.) and 1-chloroanthraquinonesulfonic acid-7 (Na salt more sol. boilg. aq, corresp. sulfonyl chloride, lemon-yel. pl. from C_6H_6 , m.p. 200–201° dec.); the m.p. of mixts. of the two sulfonyl chlorides is depressed below 180° (65). — \bar{C} on sulfonation in the pres. of Hg salts but otherwise as above yields, however, a different result as the principal prod. is 1-chloroanthraquinonesulfonic acid-5 (corresp. sulfonyl chloride, yel. pl. from toluene, m.p. 243–244° dec. (65) (66)), accompanied by 1-chloroanthraquinonedisulfonic acid-4,5.

3:4485 2,3,5-TRICHLOROBENZOIC Cl
$$C_7H_3O_2Cl_3$$
 Beil. IX - 345 ACID COOH IX₁—

M.P. 163° (1) 162° (2) (3)

Ndls. from hot aq. (2). — Not volatile with steam. — Very spar. sol. cold aq. but sol.

[For prepn. of C from 2,3,5-trichlorotoluene (3.0610) by oxidin with 20% HNO₃ in s.t. at 140° see (2); from 2,3,5-trichlorobenzaldehyde (3:1060) by oxidn, with KMnO₄ sec (3); for prepn. from correspondtrile by hydrolysis sec (1)]

C on soln in warm fumg. HNO₃ readily yields a mononitro cpd., 2,3,5-trichloro-xnitrobenzoic acid, cryst from alc, mp. 158° (1)

C with excess PCl₅ yields (1) 2,3,5-trichlorobenzoyl chloride, cryst. from EtOAc, m.p. 36° (1).

- Methyl 2,3,5-trichlorobenzoate: unrecorded.
- --- Ethyl 2,3,5-trichlorobenzoate: oil. [From \bar{C} + alc. + HCl (1).]
- (D) 2,3,5-Trichlorobenzamide: from 2,3,5-trichlorobenzoyl chloride + (NH₄)₂CO₃; ndls. from dil. AcOH, m p. 204-205° (1)
- ---- 2.3.5-Trichlorobenzanilide: unrecorded.

3:4485 (1) Matthews, J. Chem. Soc. 79, 43-49 (1901) (2) Cohen, Dakin, J. Chem. Soc. 81. 1331 (1902). (3) Hodgson, Beard, J. Chem. Soc. 1927, 2382.

C₁₀H₅O₂Cl Beil. S.N. 674 3:4492 5-CHLORONAPHTHOQUINONE-1,4

M.P. 163° (1)

Yellow ndls. from alc. or lgr. — Sublimes undecomposed. — Fairly eas. sol. AcOH or lgr.; moderately sol. alc.; spar. sol. aq.

[For prepn. of C from 5-chloro-1,4-diaminonaphthalene (5-chloronaphthylenediamine-1,2) by oxidn. of its hydrochloride with FeCl₃ see (1).]

[C with aniline (no details) gives (1) 2(3?)-anilino-5-chloronapthoquinone-1,4, red

bronzy ndls. from AcOH, m.p. 219° (1); note also that Č with aniline boiled for 1 hr. gives (1) a halogen-free cpd., dark violet cryst. from alc., m.p. 140°, but its structure has not been determined.]

3:4492 (1) Fries, Köhler, Ber. 57, 504-505 (1924).

 $(\alpha,\alpha,\alpha',\alpha'$ -Tetrachlorobibenzyl; tolane tetrachloride)

Colorless cryst from AcOH, pet. ether, C_6H_6 , or toluene. — Eas. sol. boilg. C_6H_6 ; moderately sol. hot but spar. sol. cold pet. ether; spar. sol. alc. or ether.

Č with trans-tolane dichloride (3:4210) forms an isomorphous mixt. (8) formerly erroneously regarded as an individual cpd. designated as "ditolane hexachloride."

PREPARATION OF C

From Dinuclear Initial Materials

[For prepn. of \bar{C} from benzil (1:9015) with excess PCl₅ (32% yield (10)) in s.t. at 200° for 6-7 hrs. (5), or from ms-dichlorodesoxybenzoin ("chlorobenzil") [Beil. VII-436, VII₁-(234)] with PCl₅ in s.t. at 200° (11) in POCl₃ soln. (100% yield (12)) cf. (5), see indic. refs.; from diphenylacetylene (tolane) [Beil. V-656, V₁-(319), V₂-(568)] in CHCl₃ at 0° (13) or from either cis-(3:1380) or trans-(3:4210) tolane dichloride (9) with Cl₂ see indic. refs.]

From Mononuclear Initial Materials

From benzotrichloride. [For prepn. of \bar{C} from benzotrichloride (3:6540) by reduction in alc. with H_2 + colloidal Pd (75% yield (4)) or H_2 + Pd/BaCO₃ (14) in alc.-alkali, or by htg. with Cu powder at 100° (6) or in C₆H₆ under reflux for 4 hrs. (30-36% yield (5)) (1) cf. (10), see indic. refs.; for formn. of \bar{C} from benzotrichloride (3:6540) with excess dilute (0.2 N) MeMgCl in ether (7), with EtMgBr (3) or C₆H₆MgBr (3), or by pyrolysis over hot Pt (15), or by htg. with Ni in atm. of CO₂ (16) see indic. refs.]

CHEMICAL BEHAVIOR OF C

[\bar{C} on reduction with conc. HI + P (1) or with H₂ in alc.-alk. + Pd/CaCO₃ (14) gives bibenzyl (1:7149), m.p. 52°.]

[\tilde{C} on removal of two adjacent chlorine atoms with Fe powder in boilg. AcOH (12) cf. (5), with Cu powder at 160° (6), with excess conc. (2 N) MeMgCl in ether refluxed 4 hrs. (7), with H₂ + hydrazine hydrate in MeOH/KOH 1½ hrs. at b.p. (17), or with Zn dust in boilg. alc. (18) (5) (2) (10) gives either or both trans- (3:4210) and cis- (3:1380) tolane dichlorides; note that use of insufficient Zn gives (8) cf. (5) (10) the cis-tolane dichloride (3:1380) + an isomorphous mixt. of \tilde{C} + trans-tolane dichloride (3:4210).]

- [$\bar{\mathbf{C}}$ with Na/Hg in alc. gives (11) diphenylacetylene (tolane) (see ref. above), some stilbene (1:7250) and bibenzyl (1:7149) also being formed (2). $\bar{\mathbf{C}}$ on htg. with Zn dust gives (2) stilbene (1:7250).]
- [\bar{C} is very resistant to hydrolysis and is unattacked by H_2O , alc., or AcOH in s.t. at 200° (2); note, however, that \bar{C} with AcOH in s.t. at 230–250° or with H_2SO_4 at 165° is claimed (2) to give benzil (1:9015).]
- [\bar{C} is very resistant to action of boilg. HNO₃ (2); note, however, that p,p'-dinitrotolane dichloride, m.p. 264–265° dec., has been prepd. indirectly (19) (from p-nitrobenzal(di)-chloride with acetone + KOH).]
- [C with anhydrous HF at 100° yields (20) 1,2-difluoro-1,2-diphenylethylene, m.p. 122-123° (20); however, C with HF in pres. of HgO gives (20) 1,2-dichloro-1,2-difluoro-1,2-diphenylethane, m.p. 128-130° (20).]

CHAPTER XI

DIVISION A. SOLIDS

(3:4500-3:4999)

3:4500 2,3,6-TRICHLOROBENZOIC
$$Cl$$
 $COOH$ $C_7H_3O_2Cl_3$ Beil. IX - 345 IX₁—

M.P. 163-164° (1) 163-165° (2)

Cryst. from aq. (1).

[For prepn. of C from 2,3,6-trichlorotoluene (3:0625) by oxidn, with HNO₃ see (1) (2).] No further data on this compd. are recorded

3:4500 (1) Cohen, Dakin, J. Chem. Soc. 81, 1332 (1902). (2) Feldman, Kopeliowitsch, Arch. Pharm. 273, 494 (1935).

M.P. 164° (1) 160° (2) 159-160° (3)159°

162°

(2)

Colorless cryst. (from alc. (1)) with camphoraceous odor. — Readily sublimes in open tubes on htg; eas sol. alc. ether

[For prepn. of C from tetramethylethylene glycol (pinacol) (1 5805) with fumg. HCl (4) or with PCl₃ (5) see (4) (5); for formn. from 2,3-dimethylbutane (di-isopropyl) (1:8515) with Cl_2 in pres. of I_2 see (4) (6)]

C with alc. KOH in s.t. at 130-140° gives (4) mainly 2,3-dimethylbutadiene-1,3 (1:8050), b.p. 68.7° (accompanied by unsatd. ethers, b.p. 136-146°) (4). [For study of behavior of C with aq. alc. NaOH see (3).

3:4520 (1) Kahovec, Wagner, Z. physik. Chem. **B-47**, 53 (1940). (2) Schorlemmer, Ann. **144**, 186–187 (1867). (3) Tishchenko, J. Gen. Chem. (U.S.S.R.) **9**, 1380–1388 (1939); C.A. **34**, 1611 (1940). (4) Kondakow, J. prakt. Chem. (2) 62, 169-174 (1900). (5) Couturier, Ann. chim. (6) 26, 443-444 (1892). (6) Silva, Ber. 6, 36 (1873).

Long ndls. from hot aq. (4); cryst. from C₆H₆ + pet. eth. — Eas. sol. alc., ether, or CHCl₃ (5).

[For prepn. of \bar{C} from 2,4,6-trichloroaniline [Beil. XII-627] via conversion by diazo reactn. to 2,4,6-trichlorobenzonitrile, m.p. 77.5° (1), 75° (6), thence to 2,4,6-trichlorobenzamide (see below) and hydrolysis of latter see (1) (4) (5) (2) (12), for prepn. of \bar{C} from 2,4,6-trichlorotoluene (3:0380) by oxidn. with HNO₃ see (3).]

C on soln. in 5 pts. conc. HNO₃ yields (1) 2,4,6-trichloro-3-nitrobenzoic acid [Beil. IX-405], cryst. from CHCl₃, m p. 169 2° (1).

 \bar{C} with PCl₅ (5) (73% yield (2)) or with SOCl₂ + pyridine (7) gives 2,4,6-trichlorobenzoyl chloride, b.p. 272° (5), 107-107.5° at 6 mm. (2), 120.1-120.4° at 3 mm. (7). — This acid chloride is very stable to aq (5) and is alleged to give no ester with MeOH (5). [Note, however, that with EtOH reactn is 99% complete in 1 min (7).] [For study of reactn. of 2,4,6-trichlorobenzoyl chloride with MeMgCl (8) or MeMgBr (12) giving (50% yield (2)) di-(2,4,6-trichlorobenzoyl)methane, m.p. 160-161°, see (8), with MeMgBr giving 2,4,6-trichloroacetophenone, m.p. 51° (8) (14), see (8); with C_0H_6 + AlCl₃ yielding 2,4,6-trichlorobenzophenone, m.p. 103 5°, see (9)]

- Methyl 2,4,6-trichlorobenzoate: unrecorded. $[\bar{C} + MeOH + HC]$ yields no ester (4) (10)]
- Ethyl 2,4,6-trichlorobenzoate: unrecorded. [\bar{C} + EtOH + HCl yields no ester (5)]
- ② 2,4,6-Trichlorobenzamide: m p. 181° (1), 177° (6). [This amide has not been recorded as prepd. from the acid chloride + NH₃; it has been obtd. only by partial hydrolysis (11) (6) (1) of 2,4,6-trichlorobenzonitrile (see above)] [The amide itself is only slowly hydrolyzed to C by 75% H₂SO₄ at 160° (6), but for conversion to C via HNO₂ see (11) (1) (2).]
- 2,4,6-Trichlorobenzanilide: from 2,4,6-trichlorobenzoyl chloride + aniline (12), ndls., m.p. 197° (12).
- 3:4545 (1) Montagne, Rec. trav. chim. 21, 383-388 (1902). (2) Fuson, Bertetti, Ross, J. Am. Chem. Soc. 54, 4381-4382 (1932). (3) Cohen, Dakin, J. Chem. Soc. 81, 1336 (1902). - (11) Sudborough, J. Chem. Soc. 67, 602 (1895)
 (12) Chapman, J. Chem. Soc. 1927, 1749.
 (13) Fuson, Van Campen, Wolf, J. Am. Chem. Soc. 60, 2269-2270 (1938).
 (14) Lock, Böck, Bor. 70, 925 (1937).

Cryst. from aq., alc. (3), C_6H_6 or $C_6H_6 + \lg r$.—Sublimes undecomposed in ndls. (9) or lfts. (10) — Eas. sol. in boilg. aq. or org. solv. (10).

[For prepn. of \bar{C} from 2,4-dichlorotoluene (3:6290) by oxidn. with dil. HNO₃ at 140° (9) (7) (8) or with KMnO₄ (70% yield (1)) or by electrolytic oxidn. (65% yield (3)) see indic. refs.; from 2,4-dichlorobenzaldehyde (3:1800) via Cannizzaro reactn. see (5); from 2,4-dichloroaniline [Beil. VII-621] via conversion to and hydrolysis of 2,4-dichlorobenzoni-

trile see (4) (5); from 2,4-dichlorobenzotrichloride with 95% H_2SO_4 see (5) (11) (12); for still other misc. methods see Beil. IX-342 + IX₁-(141).]

 \bar{C} warmed at 100° with a mixt. of fumg. HNO₃ (D=1.52) + conc. H₂SO₄ as directed (13) yields 2,4-dichloro-3,5-dinitrobenzoic acid, pr. from dilute alc., m.p. 210-211° (13), together with a trace of 2,4-dichloro-1,3-dinitrobenzene, m.p. 103°, insol. in Na₂CO₃. [A mononitrated \bar{C} , viz., 2,4-dichloro-5-nitrobenzoic acid, cryst. from 30% AcOH, m.p. 161-163° (11), 162° (18), and 2,4-dichloro-6-nitrobenzoic acid, cryst. from C₆H₆, m.p. 189-190° (19), have been prepd. indirectly.]

C with PCl₅ (14) or SOCl₂ (15) (3) yields 2,4-dichlorobenzoyl chloride, b.p. 150° at 3-4 mm. (14), 152-155° at 30 mm. (16), 91.9-92.5° at 1 mm. (15). [For conv. of this acid chloride to 2,4,2',4'-tetrachlorodibenzoyl peroxide see (3).]

- Methyl 2,4-dichlorobenzoate: oil, b.p. 132° at 15 mm., $D_{20}^{20} = 1.572$ (21). [From \tilde{C} by conv. to Na \tilde{A} and htg. with MeI in MeOH for 20 hrs. (73% yield (21))].
- Ethyl 2,4-dichlorobenzoate: constants unrecorded. [For study of rate of hydrolysis see (17).]
- 2,4-Dichlorobenzamide: unrecorded.
- . 2,4-Dichlorobenzanilide: unrecorded.

3:4580 3,5-DICHLOROPHTHALIC ACID

СООН

Beil. IX - 817 IX₁—

M.P. 164° (1) 164° dec. (2)

[See also 3,5-dichlorophthalic anhydride (3:2375).]

Colorless ndls. or tbls. from aq. HCl; readily sol. in cold alc., ether, or acetone, but spar. sol. in C_6H_6 or CHCl₃ even on boilg.

[For prepn. of \bar{C} from 3,5-dichlorophthalic anhydride (3:2375) on boilg. with aq. see (1) (2); from aq. soln. of NH₄H \bar{A} by passing in HCl gas see (1) (2); from 3,5-dichloro-1,2-dimethylbenzene [Beil. V-364] (itself obtd. in good yield from dimethyldihydroresorcinol ("methone") (1:0768) with PCl₅ in CHCl₃ (2) (3)) by oxidn. with dil. HNO₃ in s.t. at 190-200° see (2).]

Salts. $NH_4H\bar{A}$, spar. sol. aq., eas. prepd. by mixing aq. solns. of $(NH_4)_2\bar{A} + \bar{C}$; $Ag_2\bar{A}$, white curdy ppt. from warm aq. soln. of $(NH_4)_2\bar{A}$ by addn. of aq. Ag_3NO_3 .

Esters. Dimethyl 3-chlorophthalate and methyl hydrogen 3-chlorophthalate are unreported: diethyl 3-chlorophthalate (from Ag₂A with EtI in dry ether) is oil, b.p. 312-313° at 760 mm. (2); ethyl hydrogen phthalate is unreported.

Č on htg. alone (1) or with AcCl (2) yields 3,5-dichlorophthalic anhydride (3:2375), m.p. 89°.

3:4580 (1) Waldmann, Schwenk, Ann. 487, 293 (1931). (2) Crossley, LeSueur, J. Chem. Soc. 81, 1536-1537 (1902). (3) Crossley, LeSueur, J. Chem. Soc. 82, 826-827 (1902).

[See also 2,6-dichlorobenzoquinone-1,4 (3:3750).]

Colorless lfts. from dil. alc.; ndls. from aq. or C6H6. — Sublimes.

[For prepn. of \bar{C} from 2,6-dichlorobenzoquinone-1,4 (3:3750) by reductn. with SO₂ in aq. see (80% yield (5)) (6) (7) (note, however, that the quinone in dil. aq. NaOH under N₂ with SO₂ is in part reduced to \bar{C} and in part sulfonated to mono- and disulfonic acids (8)); from 2,4,6-trichlorophenol (3:1673) in 2 N H-SO₄ on electrolytic oxidn. see (4); from 3,5-dichloro-4-hydroxybenzaldehyde (3:4400) in N KOH with H₂O₂ see (3); from sodium benzoquinone-1,4-sulfonate with conc. HCl above 20° in CO₂ (below 20° chlorohydroquinonesulfonic acid results) see (1) (9).]

[For use of \bar{C} as antioxidant and gum inhibitor in cracked gasoline see (10); for use in aq. petroleum emulsion as insecticidal oil spray see (11); for use as vulcanization accelerator see (18).]

Č on oxidn. with CrO₃ (12) or with excess aq. FeCl₃ on warming (3) yields 2,6-dichlorobenzoquinone-1,4 (3:3750) (the intermediate quinhydrone cpd., brown powder or pr. or dark ndls. (5), m.p. 135° (13), may separate with insufficient oxidant). [For studies on oxidn.-reductn. potential of system: Č + 2,6-dichlorobenzoquinone-1,4 (3:3750) see under latter.]

 $[\bar{C}$ in conc. H_2SO_4 with chloral hydrate (3:1270) (2 moles) gives (64% yield (14)) 5,7-dichloro-6-hydroxy-2,4-bis-(trichloromethyl)benzdioxin-1,3, colorless pl. from boilg. alc., CHCl₃, C_6H_6 , or pet. eth., m.p. $114-115^\circ$ (14).

- —— 2,6-Dichlorohydroquinone diacetate: ndls. and pr. from aq. alc., m.p. 98° (2). 85-86° on rap. htg., 111-113° on slow htg. (15), 75.5° (7), 66.5° (16). (The reasons for these divergences appear never to have been explained.) [From C with Ac₂O (16) (15).]
- **D 2,6-Dichlorohydroquinone dibenzoate:** colorless ndls. from alc., m.p. 105° (16). [From $\tilde{\mathbf{C}}$ on htg. with BzCl (16).]
- D 2,6-Dichlorohydroquinone dimethyl ether: m.p. not reported. [From C in dil. aq. alk. with Me₂SO₄ (17); this prod. with 3-4 pts. cold fumg. HNO₃ nitrates yielding (17) 2,6-dichloro-3,5-dinitrohydroquinone dimethyl ether, colorless cryst. from alc., m.p. 121-123° (17).]

3:4610 6-CHLORO-2-HYDROXYBENZOIC ACID

(6-Chlorosalicylic acid)

414

Beil. S.N. 952

M.P. 166° (1)

Colorless adds. from aq., grad. turning red in air. — Sol. in aq. and most org. solvents; not volatile with steam.

[For prepn. of \bar{C} from 6-chloro-2-aminobenzon acid (6-chloroanthranilic acid) [Beil. XIV-366, XIV₁-(548)] by diazotization and boilg. with aq. (*m*-chlorophenol (3:0255) is also formed) see {1}.]

C with FeCl₃ soln. gives violet color.

For NH₄ \bar{A} , K \bar{A} , Ba \bar{A}_2 , Ag \bar{A} , all sol. in aq., see (1).

[The methyl ether of \bar{C} , viz., 6-chloro-2-methoxybenzoic acid, m.p. 141° (2), has been obtd. indirectly from 2-chloro-6-methoxytoluene [Beil. VI-359] by KMnO₄ oxidn. (2)]

[For esterification of C with glycol monoethers and use of prods. as plasticizers see (3).]

3:4610 (1) Cohn, Mitt. Technol. Gewerb -Mus. Wien. 11, 178-182, Cent. 1901, II 925. (2) Ullmann, Panchaud, Ann. 350, 113 (1906) (3) Grether, DuVall (to Dow Chem. Co.), U.S. 2,234,374 March 11, 1941; C.A. 35, 3738 (1941).

3:4612 DI-(p-CHLOROPHENYL)ACETIC ACID

 $\begin{array}{c} \text{Cl} \\ \text{Cl} \\ \text{Cl} \end{array}$

Colorless cryst. from dil. alc. Neut. Eq. = 281.

[For prepn. of Č from 1,1,1-trichloro-2,2-bis-(p-chlorophenyl)ethane ("DDT") (3:3298) by action of excess Ba(OH)₂.8H₂O in ethylene glycol under reflux for 10-12 hrs. (33% yield) see (1); from 1,1-dichloro-2,2-bis-(p-chlorophenyl)ethylene (3:2438) by similar treatment (1) or with alc. KOH in s.t. at 150-160° for 24 hrs. (57% yield (2)) see indic. refs.; for prepn. of Č from chlorobenzene (3:7903) by condensation with glyoxylic acid monohydrate (HO)₂CH.COOH in pres. of conc. + fumg. H₂SO₄ at 20° (18.6% yield) see (1).]

C with KOH in ethylene glycol refluxed 10-12 hrs. loses CO₂ giving alm. 100% yields (1) of 4,4'-dichlorodiphenylmethane (3:1057), m.p. 55°.

Note that \tilde{C} is one of the metabolitic prods. obtd. from the urine after administration of "DDT" (3:3298) to rabbits,

3:4612 (1) White, Sweeney, U.S. Pub. Health Repts. 60, 66-71 (1945). (2) Grummitt, Buck, Jenkins, J. Am. Chem. Soc. 67, 156 (1945).

Colorless ndls. from aq. or alc.

[For prepn. of \tilde{C} from 6-chloro-3-methylacetophenone [Beil. VII-307] by oxidn. with KMnO₄ or dil. HNO₃ see (1); from β -chloroethyl 6-chloro-3-methylphenyl ketone (2) by oxidn. at 100° with mixt. of equal pts. conc. HNO₃ (D=1.42) and water see (2); from β -chlorotoluene (3.8287) in CS₂ with oxalyl (dr)chloride (3:5060) + AlCl₃ for 20 hrs. at room temp. see (3).]

[C with 6 pts SOCI₂ gives (alm. quant. yield (3)) 6-chloro-3-methylbenzoyl chloride, b.p. 165-167° at 85 mm. (3).]

 \bar{C} on oxidn. with KMnO₄ yields (1) (3) 4-chlorobenzenedicarboxylic acid-1,3 (4-chlorosophthalic acid) (3:4980), m.p. 286° u.c. (1).

3:4615 (1) Claus, J. prakt Chem. (2) **46**, 27 (1892). (2) Mayer, Muller, Ber. **60**, 2281 (1927). (3) Scholl, Meyer, Keller, Ann. **513**, 298 (1934).

Ndls. from aq. or dil. alc. — Alm. insol. cold aq., eas. sol. cold abs. alc. (4). — Sublimes in ndls. (4).

[For prepn. of \bar{C} from 1,2,4-trichlorobenzene (3:6420) via nitration, reduction, conversion via diazo reactn. to 2,4,5-trichlorobenzonitrile, m.p. 104° (1), and subsequent indirect hydrolysis see (1); from 2,4,5-trichlorotoluene (3:2100) by oxidn. with HNO₃ (4) (6) or CrO₃ (5) see (4) (5) (6), from 2,4,5-benzotrichloride via htg. with aq. in s.t. at 260° see (3); from 3,4-dichlorobenzoic acid (3.4925) + Ca(OCl)₂ see (3); from HNO₃ oxidn. of certain fractions of chlorinated isopropylbenzene (cumene) see (2).]

For salts, viz., $NH_4\bar{A}$, $Ca\bar{A}_2.2H_2O$; $Sr\bar{A}_2.4H_2O$; $Ba\bar{A}_2.7H_2O$, see (3).

 \bar{C} on nitration with hot mixt. of equal vols. conc. HNO₃ + conc. H₂SO₄ yields (3) 2,4,5-trichloro-x-nitrobenzoic acid, ndls. from aq., m.p. 220° (3).

Č with PCl₅ (3) or SOCl₂ (1) yields 2,4,5-trichlorobenzoyl chloride, b.p. 272° sl. dec. (3), 125° at 2 mm. (1); m.p. abt. 28° (1), 41° (3).

- ---- Methyl 2,4,5-trichlorobenzoate: unrecorded.
- Ethyl 2.4.5-trichlorobenzoate: from \overline{C} + EtOH + HCl (3): m.p. 65° (1) (3).
- D 2,4,5-Trichlorobenzamide: from 2,4,5-trichlorobenzoyl chloride + cold conc. NH₄OH (3), ndls. from C₆H₆, m.p. 167.5° (3), 168° (1). [For conversion of this amide to C via HNO₂ see (1).]

3:4650 2,3-DICHLOROBENZOIC ACID

M.P. 168.3° cor. (1) 166° (2) 164° (3) 163° (4)

Cryst. from C₆H₆ or from 30% AcOH (1).

[For prepn. of \bar{C} from 2,3-dichlorotoluene (3:6345) with alk. KMnO₄ (1) (2) or with dil. HNO₃ in s.t. at 140° (2) (4) see (1) (2) (4); from benzoic acid (1:0715) by chlorination with KClO₃ + HCl (3) (6) or with Ca(OCl)₂ (7) see (5) (6) (7).]

For f.p./compn. data on mixts. of C with 2,5-dichlorobenzoic acid (3:4340), m.p. 154.4°, see (1).

C on htg. with lime yields (6) o-dichlorobenzene (3:6055).

 \bar{C} is unaffected by conc. H₂SO₄ at 300° (6) and scarcely affected by htg. with fumg. HNO₃ (10). — However, \bar{C} dislvd. in bolg. non-fumg. HNO₃ and treated as directed (10) with conc. H₂SO₄ yields 2,3-dichloro-x-nitrobenzoic acid, m.p. 214-215° u.c. (10).

Č with PCl₅ yields (8) 2,3-dichlorobenzoyl chloride, b.p. 140° at 14 mm. (8). [This acid chloride is formed during chlorination of benzoyl chloride in presence of FeCl₃ where it constitutes 23% of the dichlorinated fraction (8).]

- --- Methyl 2.3-dichlorobenzoate: unrecorded.
- Ethyl 2,3-dichlorobenzoate: m.p. unrecorded. [For study of velocity of hydrolysis see (9).]
- 2.3-Dichlorobenzamide: unrecorded.
- 2,3-Dichlorobenzanilide: unrecorded.

3:4670 5-CHLORO-2-METHYLBENZOIC ACID

M.P. 168.5–169.5° (1) 168° (2)

Colorless ndls. from alc.

Note that the materials of m.p. 130° (3) and 137° (4) formerly supposed to have been \tilde{C} are now believed (1) to have been mixtures of \tilde{C} with the isomeric 4-chloro-2-methylbenzoic acid, m.p. 170° (3:4700).

[For prepn. of C from 5-chloro-2-methylaniline [Beil. XII-835, XII₁-(384)] via conv. to 5-chloro-2-methylbenzonitrile (1) (2), ndls. from pet. ether, m.p. 48° (2), 45-46° (1), and saponification of the latter with 70% H₂SO₄ (2) see indic. refs.]

[\bar{C} yields (no details) an acid chloride which with $C_6H_6+AlCl_3$ in CS_2 gives (2) 5-chloro-2-methylbenzophenone, m.p. 41° (2), b.p. 191° at 12 mm. (2).]

C on oxidn. with KMnO₄ yields (1) 4-chlorophthalic acid (3:4390), m.p. 151° (1).

- ---- Methyl 5-chloro-2-methylbenzoate: unreported.
- Ethyl 5-chloro-2-methylbenzoate: b.p. unreported, $D_4^{20} = 1.1628$ (1), $n_{\rm He}^{20.0} = 1.52483$ (1).
- ---- 5-Chloro-2-methyl benzamide: unreported.

3:4672 2,3,5-TRICHLOROBENZO-QUINONE-1,4

Yellow lfts. from alcohol; reddish yel. lfts. from CHCl₃/lgr. — Insol. cold aq.; spar. sol. cold alc.; eas. sol. hot alc. or ether. — \tilde{C} is sublimable [for study of sublimation press see (8).]

[For studies of heat of formation see (9); for studies of heat of combustion see (10) (11).] [For studies of bactericidal actn. of \bar{C} see (12); for patent on use of \bar{C} as vulcanization accelerator see (13)]

PREPARATION OF C

From 2,3,5-trichlorohydroquinone. [For prepn. of C from 2,3,4-trichlorohydroquinone (3:4052) by oxidn., e.g., with CrO₃ at 0° (10), conc. HNO₃ (14) (5) see indic. refs.]

From phenol or chlorinated phenols. [For prepn of \bar{C} from phenol (1:1420) via sulfonation followed by oxidn. with KClO₃ + HCl see (3) (15) cf. (22); note that by this method both \bar{C} and 2,3,5,6-tetrachlorobenzoquinone-1,4 ("chloranil") (3:4978) are produced; for sepn. of \bar{C} from latter see (5) (16)]

[For prepn. of \bar{C} from 2,3,5-trichlorophenol (3:1340) or from 2,3,6-trichlorophenol (3:1160) with fumg. HNO₃ on protracted htg. (17), or from 2,4,6-trichlorophenol (3:1673) with mixt. of conc. HNO₃ + conc. HCl boiled for a few minutes (2), or from 2,3,4,6-tetrachlorophenol (3:1687) by oxidn. with 5 wt. pts. fumg. HNO₃ (70% yield (1)), see indic. refs.]

From amines, aminophenols, etc. [For form. of \bar{C} from aniline during electrolytic oxidn. in HCl soln. see (18); from p-aminophenol hydrochloride with Ca(OCl)₂ soln. see (19); from 2,3,5-trichloro-4-aminophenol hydrochloride by action of Br₂ (20) or NaQBr

(30); from benzal p-anisidine or benzal p-phenetidine by treatment with ter-AmOCl (3:9287) followed by subsequent oxidn. with $K_2Cr_2O_7/H_2SO_4$ see (4).]

From various derivs. of $\bar{\mathbf{C}}$ by hydrolysis. [For form. of $\bar{\mathbf{C}}$ from various imide derivs. of $\bar{\mathbf{C}}$ by acid hydrolysis, e.g., from the corresp. $N-(\rho$ -chlorophenyl)mide [Beil. XII-611] (21), N-(2,4,6-trichlorophenyl)imide [Beil. XII-628] (22) (7), or N-(2,4-dinitrophenyl)-imide [Beil. XII-754] (23), see indic. refs.]

From miscellaneous sources. [For formn. of \bar{C} from C_6H_6 (1:7400) by oxidn. with $CrO_2Cl_2/AcOH$ (24), from copper salt of quinic acid [Bell. X-535, X_1 -(270)] by oxidn. with $MnO_2/NaCl/H_2SO_4$ (14), or from benzoquinone-1,4 (1:9025) with Cl_2 (25) see indic. refs.]

CHEMICAL BEHAVIOR OF C

Reduction. \bar{C} with aq. SO₂ (5) (14) (15) (16), or \bar{C} in other soln, with aq. SO₂ (1) reduces to 2,3,5-trichlorohydroquinone (3:4052). [Note that this reaction is used (16) to separate \bar{C} from 2,3,5,6-tetrachlorobenzoquinone-1,4 ("chloranil") (3:4978) since the latter is but slowly reduced by aq. SO₂] [For studies of oxidin-reduction potential of system \bar{C} + 2,3,5-trichlorohydroquinone (3:4052) see (6) (26) (27).]

Oxidation. \bar{C} with strong HNO₃ on digestion is degraded with forms, of trichloronitromethane ("chloropierin") + CO₂ (15).

Chlorination. [\bar{C} with Cl_2 reacts only very slowly; however, \bar{C} with $Cl_2 + I_2 + aq.$ (15), or \bar{C} with $Cl_2 + HCl$ (28), gives 2,3,5,6-tetrachloro-benzoquinone-1,4 ("chloranil") (3:4978).]

Reaction with HCl. \tilde{C} with conc. HCl on protracted boilg. (29) (3), or \tilde{C} with fumg. HCl in s.t. at 130° (30), gives 2,3,5,6-tetrachlorohydroquinone (3:4941).

Behavior of C with other inorganic reactants. With aq. alkali. [C with dil. aq. KOH turns green and then dis. to a red-brown soln. from which upon acidification is pptd. (5) 2,5-dichloro-3,6-dihyroxybenzoquinone-1,4 ("chloroanilic acid") (3:4970).]

With aq. K_2SO_3 . [\bar{C} dis. in warm aq. K_2SO_3 or KHSO₃ and on cooling ppts. (31) the potassium salt of 2,3,5-trichlorohydroquinonesulfonic acid-6 [Beil. XI-300]; the mother liquor conts. a cpd. which on boilg. with KOH gives (31) the salt of 2,5-dihydroxybenzo-quinone-1,4-disulfonic acid-3,6 [Beil. XI-353].]

With NH₃. [C with alc. NII₃ leacts vigorously yielding (3) a dark soln. from which can be obtd. in small amt. 3,6-dichloro-2,5-diaminobenzoquinone-1,4 ("chloranilamide") [Beil. XIV-144].]

With PCl_5 . [\bar{C} with PCl_5 + $POCl_3$ in s.t. at 180-200° gives (5) hexachlorobenzene (3:4949).]

Behavior of C with organic reactants. With phenol. C with K phenolate (2 moles) at 100° for 20 min. gives (32) 3-chloro-2,5-diphenoxybenzoquinone-1,4, or. tbls. from alc., m.p. 169-170° (32).

With 2,3,5-trichlorohydroquinone. $\ddot{\mathbf{C}}$ (1 mole) with 2,3,5-trichlorohydroquinone (1 mole) (3:4052) in CHCl₃ soln. gives on evaph. (6) (33) the corresp. quinhydrone, green-black cryst., m.p. 114-115° (6), 103° (33).

With acetyl chloride. C with AcCl in s.t. at 160-180° gives (5) 2,3,5,6-tetrachlorohydro-quinone diacetate (cf. 3:4941).

With aniline. [\tilde{C} (1 mole) with aniline hydrochloride (1 mole) in AcOH on boilg. and subsequent partial evapn. (34) cf. (35) gives (66.5% yield (34)) 2,3,5-trichloro-6-anilino-benzoquinone-1,4 [Beil. XIV-137], blue lfts. from hot alc., but without def. m.p. (35).— \tilde{C} with aniline (excess) in alc. (30) (35) or AcOH (35) gives, however, 2,5-dichloro-3,6-dianilinobenzoquinone-1,4 [Beil. XIV-144, XIV₁-(421)], yel.-brown metallic lfts. from C_6H_6 , m.p. 290° (35), 285-290° (30).]

With triphenylphosphine. \bar{C} with 20% soln. of $(C_6H_5)_3P$ in CHCl₃ gives (36) wine-red color; note, however, that a very similar behavior is shown by 2,3,5,6-tetrachlorobenzo-quinone-1,4 ("chloranil").

3:4680 8-CHLORONAPHTHOIC ACID-1

 $\begin{array}{c|c} \text{Cl} & \text{COOH} \\ \hline & & \text{C}_{11}\text{H}_7\text{O}_2\text{Cl} & \text{Beil. IX - 651} \\ \hline & & \text{IX}_{1^-}(276) \end{array}$

M.P. 171-171.5° (1) 170-170.5° (1) 169-170° (2) 168-169° (3) 167-168° (3) 167° (4) (5)

Cryst. from C₆H₆ (2), scales from alc. (4). — Subl. in ndls. (4).

[For prepn. of \bar{C} from naphthalic acid (1:0890) via conv. with Hg(OAc)₂ to anhydro-8-hydroxymercuri-1-naphthoic acid and subsequent reactn. with Cl₂ in AcOH see (1) (3) (6) (7) cf. (8); from 8-aminonaphthoic acid-1 [Beil. XIV-534, XIV₁-(623)] via diazotization and reactn. with CuCN see (4); from α -naphthoic acid (1:0785) with Cl₂ in AcOH contg. I₂ see (4); from 8-nitronaphthoic acid-1 [Beil. IX-653] (3) with SOCl₂ in C₆H₆ (some dichloronaphthostyril also being formed) see (3); from 8-chloro-1-naphthonitrile (see below) by hydrolysis see (9); from 8-chloro-1-naphthoamide (see below) by hydrolysis with AcOH/H₂SO₄ + NaNO₂ see (5) (2).]

 \tilde{C} with Cl₂ in AcOH contg. I₂ yields (4) (1) 5,8-dichloronaphthoic acid-1 [Beil. IX-651], scales from alc., m.p. 186-187° (4) (1).

C with PCl₅ yields (5) 8-chloro-1-naphthoyl chloride (props. not reported).

Č with cold red fumg. HNO₃ yields (10) (11) 8-chloro-5-nitronaphthoic acid-1, lfts. or ndls. from alc., m.p. 227° (10), 225-226° (11). [This prod. with Cu bronze in boilg. toluene for 3 hrs. yields (11) 5-nitronaphthoic acid-1 [Beil. IX-652], m.p. 241-242°.

Salts. CaA₂.2H₂O; ndls. sol. in 42 pts. cold aq. (4).

- Methyl 8-chloro-1-naphthoate: oil, b.p. 188-189° at 16.2 mm. (2). [From C with ethereal diazomethane (2).]
- —— 8-Chloro-1-naphthonitrile: ndls. from MeOH, m.p. 150-151° (9), 145-146° (2), b.p. 200° at 18 mm. (9), 242-244° at 15.5 mm. (?) (2). [From 8-chloronaphthylamine-1 [Beil. XII-1256] via diazotization and reactn. with CuCN (yields: 57% (5), 22% (2)) (9).]
- ---- 8-Chloro-1-naphthoamide: ndls. from alc., m.p. 203.5° (5). [From the nitrile (above) by hydrolysis with AcOH/H₂SO₄ (5).]

Colorless ndls. from aq. alc., dil. AcOH or C_6H_6 ; eas. sol. hot aq.; eas. volatile with steam. [For prepn. of \bar{C} from 4-chloro-1,2-dimethylbenzene (3:8675) by oxidn. with boilg. dil. HNO₃ (D=1.20) (7) or with 20 pts. dil. HNO₃ (D=1.10) in s.t. at 160° for 5-6 hrs. (8) (by this method \bar{C} is always accompanied by the isomeric 5-chloro-2-methylbenzoic acid (3:4670) separable by its less sol. calcium salt (1) (8) (7)) see indic. refs.; from 4-chloro-2-methylbenzaldehyde [Beil. VII-296] by air oxidn. see (4); from chloromethyl 4-chloro-2-methylphenyl ketone (4-chloro-2-methylphenacyl chloride) [Beil. VII-306] by oxidn. with KMnO₄ see (2); from β -chloro-2-methyl 4-chloro-2-methylphenyl ketone (5) by oxidn. at 100° with mixt. of equal pts. conc. HNO₃ and aq. see (5); from 4-chloro-2-methylbiphenyl (3) by oxidn. with $CrO_3/AcOH$ (8% yield) see (3); from 1-methyl-1-(trichloromethyl)cyclohexadiene-2,5-one-4 [Beil. VII-149] by treatment with PCl₅ giving 4-chloro-2-methylbenzotrichloride, followed by alk. hydrolysis of the latter, see (9); from 4-chloro-2-methylbenzonitrile, m.p. 67° (1) (10), by boilg. for 16 hrs. with 8% aq. KOH sec (1) (10).]

 \bar{C} on oxidn. with alk. KMnO₄ (7) or with 10-20 pts. dil. HNO₃ (D=1.13) in s.t. at 180-200° for 5 hrs. (1) yields 4-chlorophthalic acid (3:4390).

Č fused with KOH yields (7) 4-hydroxy-2-methylbenzoic acid [Beil. X-215], m.p. 172-173° (7).

Salts. NH₄ \bar{A} , cas. sol. aq.; K \bar{A} .H₂O, very eas. sol. aq.; Ca \bar{A}_2 .3H₂O more sol. in aq. than corresp. salt of 5-chloro-2-methylbenzoic acid (3:4670); Ba \bar{A}_2 .4H₂O, more eas. sol. aq. than calcium salt (for details see (1)).

- --- Methyl 4-chloro-2-methylbenzoate: unrecorded.
- Ethyl 4-chloro-2-methylbenzoate: oil, b.p. 258° (1), $D_4^{20} = 1.1626$ (10), $n_{\rm He}^{20} = 1.52705$ (10). [From $\bar{\rm C}$ in EtOH with HCl gas (1) or from the amide (see below) with ethyl nitrite in s.t. at 140° for 4-5 hrs. (1).]
- —— 4-Chloro-2-methylbenzamide: colorless ndls. from hot aq., from alc. or ether, m.p. 183° (1). [Obtd. indirectly by partial sapon. of corresp. nitrile (above) (1).]

M.P. 172° (1) B.P. 180° at 26 mm. (1) 174° (2)

[See also naphthalene tetrachloride (3:4750)]

Cryst, from AcOH.

[For prepn. of $\bar{\mathbb{C}}$ from 1,2,3,4-tetrahydronaphthalene (tetralin) (1:7550) with $\mathbb{C}l_2$ in pres. of \mathbb{I}_2 (15% yield (2)) at 15° in diffuse daylight see (1) (2); for forms, in small amt. from tetralin during prepn. of 7-chloro-1,2,3,4-tetrahydronaphthalene (β -chlorotetralin) with $\mathbb{C}l_2$ in pres. of \mathbb{I}_2 at 10° see (1).]

 \bar{C} with $2Br_2$ in boilg. CS_2 yields (1) 1,2-dibromo-5,6,7,8-tetrachloronaphthalene [Beil. V_2 -(388)], m.p. 142° (1), which with alc. (?) NaOEt gives (alm. quant. yield (1)) 1,2,3,4-tetrachloronaphthalene [Beil. V_2 -(446)], m.p. 198°.

3:4703 (1) von Braun, Ber. 56, 2337 (1923). (2) Wynne, J. Chem. Soc. 1946, 61.

3:4704 3-CHLORONAPHTHOQUINONE-1,2 (3-Chloro-β-naphthoquinone) Cl C₁₀H₅O₂Cl Beil. VII-72C

M.P. 172° (1) (2) (3)

Red ndls. from CHCl3. — Sol. hot alc., AcOH, C6H6, CHCl3.

[For prepn. of \bar{C} from β-naphthol (1:1540) by conversion with Cl₂ in AcOH (2) to 1,1,3,4-tetrachloro-2-keto-1,2,3,4-tetrahydronaphthalene [Beil. VII-371] (lfts. of monohydrate from aq., m.p. 90-91°; anhydrous lfts. or ndls. from hot lgr., m.p. 101-103°)

followed by treatment with aq. Na₂CO₃ (2) (3) (overall yield of \bar{C} is 56% (4)). — For prepn. of \bar{C} from naphthoquinone-1,2 (1:9062) with Cl₂ in AcOH (1) (5), or from 1,3-dichloronaphthol-2 (3:1990) by oxidn. with conc. HNO₃ in AcOH (3), see indic. refs.]

C on reduction with SO₂ in AcOH gives (1) 3-chloro-1,2-dihydroxynaphthalene [Beil.

VI-975], colorless ndls., m.p. 116-117° (1).

[Č on oxidn. with aq. Ca(OCl)₂ undergoes rupture of the quinoid ring and a subsequent series of changes (5) resulting in formation of (phthalidyl-3)-dichloroacetic acid [Beil. XVIII-419], this. of monohydrate from aq., anhydrous ndls. from C₆H₆, m.p. 157°, accompanied by some 2,2-dichloroindandione-1,3 [Beil. VII-696, VII₁-(375)], m.p. 124-125°.]

[C although insol. in aq. Na₂CO₃ gradually dissolves in dil. aq. alkali with conversion (1) to 3-chloro-2-hydroxy-naphthoquinone-1,4 (3-chloro-4-hydroxynaphthoquinone-1,2) [Beil. VIII-304], yel. ndls. from alc., m.p. 215°.]

[C with alc. NH₃ on htg. gives (1) 3-chloro-2-hydroxynaphthoquinone-1,4-imine-4 (3-chloro-4-aminonaphthoquinone-1,2) [Beil. VIII-305], m.p. abt. 260°.]

[Č with alc. aniline on htg. similarly gives (1) 3-chloro-2-hydroxynaphthoquinone-1,4-anil-4 (3-chloro-4-anilino-naphthoquinone-1,2) [Beil. XII-225], yel. ndls. from AcOH, m.p. 253°.]

Č with 2,3,-dimethylbutadiene-1,3 (1:8050) in spec. purified CHCl₃ in s.t. at 100° in dark for 1 hr. readily forms (70% yield (4)) a Diels-Alder type adduct C₁₆H₁₅O₂Cl, lemonyel. ndls. from ether/pet. ether, m.p. 87-88°; this adduct is unstable even at 10° and in alc. or ether soln. on shaking with air loses HCl and is oxidized (by loss of 2 hydrogen atoms) giving (87% yield (4)) 2,3,-dimethylphenanthraquinone, m.p. 237-238° u.c., 242-243° cor. (4). — For study of reaction of Č with excess 2,3-dimethylbutadiene-1,3 (1:8050) giving 36% yield of a halogen-free prod. of m.p. 135° see (6).

172°	(5) (6) (7) (8) (9) (22) (27)		167-168°	(17) (18) (19)

Colorless ndls. from aq. or alc.; sol. in 1100 pts. aq. at 20° and in 80 pts. aq. at 100° (17); eas. sol. alc., ether, C_6H_6 , CHCl₃, AcOH; spar. sol. lgr. — Yolatile with steam (12). — Shows sternutatory props.

[For prepn. of \tilde{C} from p-chlorophenol (3:0475) in CCl₄ with aq. NaOH (very small yield (15)) in pres. of Cu (19) or in CCl₄ with alc. KOH in s.t. at 140° for 5-6 hrs. (17) see indic. refs.; from dry sodium p-chlorophenolate with CO₂ at 140-150° under press. see (12) (20); from salicylic acid (1:0780) with Cl₂ in CS₂ (65% yield (38)) (3), in MeOH (21) or EtOH (22) (much 3,5-dichlorosalicylic acid (3:4935) also being formed), in AcOH (85%)

yield (4)) or in nitrobenzene at 50-60° (23), or with $C_6H_5ICl_2$ in suitable solvents (89% yield (2)), or by htg. with $SbCl_5$ (14), or with HCl + 30% H_2O_2 (56-66% yield (6)), see indic. refs.; from mono K salicylate in aq. with Cl_2 (24) or from di-potassium salicylate with KOCl (1) (much 3,5-dichlorosalicylic acid (3:4935) being also formed) see indic. refs.]

[For prepn. of \bar{C} from 5-chloro-2-aminobenzoic acid (5-chloroanthranilic acid) [Beil. XIV-365] with nitrous acid at 50° see (11); from 5-amino-2-hydroxybenzoic acid (5-amino-salicylic acid) [Beil. XIV-579, XIV₁-(650)] via diazotization and use of Cu₂Cl₂ reactn. (62-71% yield (16)) (25) see indic. refs.; from 5-chloro-2-hydroxybenzonitrile [Beil. X-104] by hydrolysis with H₂SO₄ see (13); from ethyl 5-chloro-2-hydroxybenzoate (see below) by hydrolysis with KOH see (7) (25); from 5-chloro-2-methoxybenzoic acid (see below) by cleavage with conc. HI see (10); from chloral-5-chlorosalicylamide (see below) by hydrolysis with 10% NaOH see (26); from 5-chlorosalicylin by oxidn. with K₂Cr₂O₇ + H₂SO₄ (18) or with KMnO₄ followed by acid hydrolysis (9) see indic. refs.; from 6-chloro-2,3-dimethyl-chromone (27), 6-chloro-2,3-diphenylchromone (28), or 7-chloro-1,2,3,4-tetrahydroxanthone (5) by alk. hydrol. see indic. refs.]

[For use of various esters of \bar{C} as mothproofing agents (29), as insecticides (30), or as plasticizers (31) (32) see indic. refs.; for studies of bactericidal power of \bar{C} see (33) (34); for study of fate of \bar{C} in animal body see (35).]

[\bar{C} on electrolytic reduction in aq. alc. H_2SO_4 yields (36) 5-chloro-2-hydroxybenzyl alcohol [Beil. VI-893], m.p. 93° (36); \bar{C} on reductn. with Na/Hg as directed (16) yields 5-chloro-2-hydroxybenzaldchyde (3:2800).]

[Č with PCl₅ (37) in lgr. (38) yields 4-chloro-2-chloroformylphenylphosphoryl dichloride, Cl.CO.C₆H₃Cl.O-P(O)Cl₂ [Beil. X-103], oil, b.p. 183-184° at 13 mm. (38); Č with PCl₃ yields (38) 4-chloro-2-chloroformylphenyl metaphosphite, Cl.CO.C₆H₃Cl.O-P:O [Beil. X-103], m.p. abt. 55-57°, b.p. 155-156° at 14 mm. (38).]

 $[\bar{C} \text{ with ClSO}_3H \text{ at } 50-70^\circ \text{ yields } (39) \text{ 3-chlorosulfonyl-5-chloro-2-hydroxybenzoic acid} [Beil. XI_1-(106)], pr. from <math>\Lambda cOH$, m.p. $206-207^\circ$ (39).]

[C with HNO₃ + conc. H₂SO₄ at 0° (23), or C on warming with fumg. HNO₃ (22), or C in AcOH treated with 5 pts. fumg. HNO₃ in AcOH (40), yields 5-chloro-3-nitrosalicylic acid [Beil. X-120], pale yel. ndls., m.p. 162–163° (22); note that by loss of CO₂ and further nitration 4-chloro-2,6-dinitrophenol [Beil. VI-260, VI₁-(128)], yel. ndls. from aq., m.p. 80° (22), is also formed.]

[\bar{C} in alc. with I_2 + HgO gives (41) 5-chloro-x-iodo-salicylic acid, colorless ndls. from hot dil. alc., m.p. 224° sl. dec. (41); \bar{C} in alk. with I_2/KI yields (25) by loss of CO₂ and further iodination 4-chloro-2,6-diiodophenol [Beil. VI₁-(112)], yellowish ndls. from alc., m.p. 108° (25) (ethyl ether, m.p. 69°, acetate, m.p. 127.5° (25)).]

Č in aq. soln. gives with FeCl₃ a violet coloration.

Salts. LiĀ, 2H₂O (8); NaĀ (8) (12), KĀ (8) all eas. sol. aq.; CaĀ₂.3H₂O (14), BaĀ₂.3H₂O (11) (12) (14) (17) (18) see indic. refs.; PbĀ₂ (11), AgĀ (12) (18), insol. aq.

- Methyl 5-chloro-2-hydroxybenzoate (methyl 5-chlorosalicylate): ndls. from alc., m.p. 50° (1), 48° (7) (12), b.p. 249° sl. dec. (12). [From C in MeOH with HCl gas (12), or from AgA with MeI (1): also from methyl salicylate (1:1750) by chlorination with methyl N.N-dichlorocarbamate in AcOH (44).]
- Ethyl 5-chloro-2-hydroxybenzoate (ethyl 5-chlorosalicylate): ndls. from alc., m.p. 25° (7). [From ethyl salicylate (1:1755) with SO₂Cl₂ (7).]
- 5-Chloro-2-methoxybenzoic acid: ndls. from aq., m.p. 82° (42), 81-82° (10), 80-81°
 (4). [Obtd. indirectly from 2-methoxybenzoic acid (1:0685) in AcOH with Cl₂ (4), or from 5-chloro-2-methoxybenzonitrile by alk. hydrolysis (43).]

- **D** 5-Chloro-2-ethoxybenzoic acid: lfts. from dil. alc., m.p. 118° (7).
- **5-Chloro-2-acetoxybenzoic acid:** cryst. from C₆H₆, m.p. 149° (8), 148° (42), 142° (25). [From $\tilde{\mathbf{C}}$ with AcCl (42),]
- 5-Chloro-2-hydroxybenzamide: Ifts. from alc. or C₆H₆, m.p. 226-227° (26) (13), 223.5-224° (7), 222-223° (8). [From methyl or ethyl 5-chlorosalicylates (above) with alc. NH₃ (7).] [This amide with chloral (3:5210) gives on warming (26) chloral-5-chloro-2-hydroxybenzamide, ndls. from C₆H₆, m.p. 148-149° dec. (26).]

3:4711 $d,l-\alpha,\alpha'$ -DICHLOROSUCCINIC COOH $C_4H_4O_4Cl_2$ Beil. II - 619 II_1 -(267) II_2 -(557) isodichlorosuccinic acid) Cl-C-H

[See also meso-\alpha,\alpha'-dichlorosuccinic acid (3:4930).]

Cryst. from ether + pet. ether. - \bar{C} is much more sol. aq. than its meso stereoisomer; e.g., 100 cc. satd aq. soln of \bar{C} at 0° conts. 64.0 g. \bar{C} (8); \bar{C} is eas. sol ether, less so in alc. [For prepn. of \bar{C} from disodium salt of fumaric acid (1:0895) with Cl₂ in satd. NaCl soln. in dark or diffuse daylight at 5° (yields: 75% (7), 68% (11), 30% (1)) (11) (9) see indic. refs. (note that as a side reactn. some addn. of HOCl also occurs leading to as much as 13% (9) chloromalic acid, and that under some (capricious) circumstances the reactn. yields as much as 80% (9) of the meso stereoisomer (3:4930)); from maleic anhydride (1:0625) in CCl₄ by addn. of Cl₂ in sunlight followed by hydrolysis see (12) (9); from d_1l - d_2 - d_1l -

dichloride [Beil. VII-573] (13) or toluquinone dichloride [Beil. VII-576] (13) by oxidn. with aq. KMnO₄ (or BaMnO₄) at 0° see (3); from $d_1 l_{-\alpha,\alpha'}$ -dichlorosuccinyl (di)chloride (3:0395) by aq. hydrolysis see (14).]

C behaves as a normal dibasic acid: titration with standard dil. aq. alk. gives Neut. Eq. 93.5. — For study of acid strength $(K_1 = 372.0 \times 10^{-4} \text{ at } 16^\circ; K_2 = 18.0 \times 10^{-4} \text{ at}$ 16.7° (8) cf. (15); for study of conductivity see (4).

[Salts (of metals): $(NH_4)_2\bar{A}.2H_2O$ (10), $K_2\bar{A}.H_2O$ (6), $KH\bar{A}.2H_2O$ (6), $CaA.2\frac{1}{2}H_2O$ (10), Ba7.7H₂O (10), CuA.2½H₂O (10), all eas. sol. aq.; SrA.7H₂O (10), sol. in 15 pts. aq.; $Pb\overline{A}.3H_2O$ (10) spar. sol. aq.]

C on boilg, with aq. (12) or with aq. KOH (7) (6) or aq. acid (6) loses 1 HCl yielding chlorofumaric acid (3:4853); for study of rate at 25° see (7) (16).

 $[K_2\bar{A}]$ in aq. soln. maintained at neutrality at 100° yields mainly (6) d_il-tartaric acid (1:0550).1

 \bar{C} with PCl₅ (2 moles) gives (100% yield (14)) $d_i l_i - \alpha_i \alpha'$ -dichlorosuccinvl (di)chloride (3:0395), m.p. 39°.

- Dimethyl $d_{sl}-\alpha_{s}\alpha'$ -dichlorosuccinate: m.p. 43° (see 3:0485).
- Diethyl $d_{l}-\alpha_{l}\alpha'$ -dichlorosuccinate: oil (see 3:9578).
- Acid salt of \bar{C} with $d_i l$ - α -phenylethylamine: pr. from aq., m.p. 149–150°, rap. htg. (6); satd. aq. soln. at 25° conts. 18.67 g./liter (6). [For details of resolution of \bar{C} with opt. act. α -phenylethylamine see (6) (1); note incidentally that, although m.p. of C is 175°, the m.p. of each of the opt. act. stereoisomeric forms is lower, viz., 166-167° dec. (6), 168° (1).]

3:4740 1,1,1,2,3-PENTACHLOROPROPANE H
$$C_3H_3Cl_5$$
 Beil. I-107 (unsym.-Pentachloropropane) $ClCH_2$ — C — CCl_3 I_1 — I_2 —

Colorless ndls. (from hot alc.) with camphoraceous odor. — Sublimes readily. — Insol. aq.; sol. org. solvents. [New comml. prod. (1942) in U.S.A.]

[For prepn. from 1,1,1-trichloropropene-2 (3:5345) by actn. of Cl_2 in diffuse light see (1).]

[For use as plasticizer with cellulose acetate films see (3).]

3:4740 (1) Victoria, Rec. trav. chim. 24, 282 (1905). (2) Henry, Rec. trav. chim. 24, 342 (1905). (3) Spicers, Ltd., Hand, Brit. 279,139, Nov. 17, 1927; French 125,165, Aug. 4, 1927; Cent. 1928, I 770.

M.P. 180-181° (1)

Ndls. from dil. alc. or lt. pet.

[For prepn. of \bar{C} from 5-chloro-2,3-dimethylphenol (5-chloro-o-3-xylenol) (3:2115) with Cl_2 in lt. pet. ether see (1).]

4,5,6-Trichloro-2,3-dimethylphenyl acetate: unreported.
 4,5,6-Trichloro-2,3-dimethylphenyl benzoate: mp. 128-129° (1).

3:4742 (1) Hinkel, Collins, Ayling, J. Chem. Soc. 123, 2971 (1923).

Colorless ndls. from aq. or dil. alc.; 100 pts. aq. at 3.5° dis. 0.8 g. \bar{C} ; eas. sol. alc., AcOH, or CHCl₃. — Volatile with steam; sublimes with slight decompn.

[For prepn. of \bar{C} from o-chlorophenol (3:5980) by treatment of dry sodium salt with CO_2 at 140–150° under press. see (3); from 5-sulfo-2-hydroxybenzoic acid (5-sulfosalicylic acid) [Beil. XI-411, XI₁-(106)] in AcOH with Cl₂ followed by hydrolysis of the resultant 3-chloro-2-hydroxy-5-sulfobenzoic acid with superheated steam (72% yield) see (1); from 6-chlorosalicylamide (see below) by hydrolysis with 10 pts boilg. 10% NaOH for 6 hrs (86% yield) see (1); for formin of \bar{C} from 7-chlorosaccharia (4) by NaOH fusion see (4); for formin from salicylic acid (1.0780) in Na₂CO₃ soln, with Cl₂ (5-chloro-2-hydroxy-benzoic acid (3:4705) is also formed) see (13).]

[For reactn of \bar{C} with methylenedisaheylamide in prepn. of dye intermediates by oxidn. with NaNO₂ see (5)]

[\bar{C} on reductn. with Na/IIg in pres. of H₃BO₃ yields(6) cf. (7) 3-chloro-2-hydroxybenzalde-hyde (3:1010); \bar{C} with ClSO₃II at 50–70° vields (8) 5-chlorosulfonyl-3-chloro-2-hydroxybenzoic acid, cryst. from CHCl₃, m p. 163–164° (8), which with Zn dust in alc. yields (9) 3,3'-dichloro-4,4'-dihydroxy-5,5'-dicarboxydiphenyl disulfide, m.p. 258–259° (9), which in turn with alk. Na₂S₂O₄ undergoes reductive cleavage to 3-chloro-2-hydroxy-5-thiol-benzoic acid (3-chloro-5-thiolsalicyhc acid), m p. 210° (9)]

[C with PCl₅ in low-boilg, pet. ether yields (2) 3-chlorosalicyloyl chloride, ndls. from pet. ether, m.p. 62-63° (2); this prod. on htg. yields (2) a mixt. of 3-chlorosalicylids: C with PCl₃ yields (2) 6-chloro-2-chloroformylphenyl metaphosphite Cl.CO.C₆H₃Cl.O.PO, m.p. abt. 65° (2).]

C in aq. soln. gives with FeCl₃ an intense violet color.

Salts. NaĀ (3), KĀ (1), CaĀ₂.3H₂O (1); BaĀ₂.3H₂O (3), AgĀ (1); for details see indic. refs.

- Methyl 3-chloro-2-hydroxybenzoate (methyl 3-chlorosalicylate): ndls. from MeOH, m.p. 38° (2), b.p. 259-260° sl. dec. (3). [From C in MeOH with HCl gas (3), or from 3-chlorosalicyloyl chloride (above) in MeOH (2).] [For formn. from methyl salicylate (1:1750) with chloropicrin under influence of light see (10) (11).]
- Ethyl 3-chloro-2-hydroxybenzoate (ethyl 3-chlorosalicylate): ndls. from cold alc., m.p. 21° (2), b.p 269-270° (2), 147° at 12 mm. (2). [From 3-chlorosalicyloyl chloride (above) with EtOH (2).]
- © 3-Chloro-2-methoxybenzoic acid: white ndls. from alc., m.p. 120-121° (1). [From \tilde{C} in dil. aq. KOH by shaking with Me₂SO₄ in cold, followed by hydrol. of the intermed. ether-ester with hot aq. KOH and subsequent acidif. (1).] [For nitration with mixt. of HNO₃ (D=1.5) + conc. H₂SO₄ at 20-30° giving (100% yield) 3-chloro-2-methoxy-5-nitrobenzoic acid, m.p. 155.5°, see (14).]
- ③ 3-Chloro-2-hydroxybenzamide (3-chlorosalicylamide): white ndls. from dil. alc., m.p. 174-175° (1). [From methyl 3-chlorosalicylate (above) or from 3-chlorosalicyloyl chloride (above) with conc. aq. NH₄OH in cold (1).]—[This prod. with chloral (3:5210) gives on warming (12) chloral-3-chlorosalicylamide, colorless ndls. from alc., m.p. 159-160° (12) (1), also obtd. from chloral-salicylamide in AcOH with Cl₂ (1).]
- ① 3-Chloro-2-hydroxybenzanilide (3-chlorosalicylanilide): colorless ndls. from alc., m.p. 158.5-159° (2). [From 3-chlorosalicyloyl chloride (above) with 2 moles aniline in ether soln. (2).]

3:4747 2,5,6-TRICHLORO-3,4-DIMETHYLPHENOL (Trichloro-o-4-xylenol)

$$\begin{array}{c|cccc} OH & & & & \\ Cl & Cl & C_8H_7OCl_3 & & Beil. \ VI - & & & \\ Cl & CH_3 & & & VI_{2^-}(456) \end{array}$$

M.P. 182.5° (1)

Ndls, from pet. ether.

[For prepn. of \bar{C} from 5-chloro-3,4-dimethylphenol (6-chloro-o-4-xylenol) (3:2705) with Cl_2 in CHCl₃ see {1}.]

2,5,6-Trichloro-3,4-dimethylphenyl acetate: unreported.

D 2,5,6-Trichloro-3,4-dimethylphenyl benzoate: m.p. 120° (1)

3:4747 (1) Hinkel, J. Chem. Soc. 125, 1853 (1924).

3:4750 NAPHTHALENE TETRACHLORIDE

(1,2,3,4-Tetrachloro-1,2,3,4-tetrahydronaphthalene; 1,2,3,4-tetrachlorotetralin)

C₁₀H₈Cl₄

Beil. V - 492 V₁---V₂-(386)

[See also 5,6,7,8-tetrachloro-1,2,3,4-tetrahydronaphthalene (3:4703).]

Cryst. from CHCl₃ or ether. — Very spar. sol. boilg alc., somewhat more sol. ether. — For data on crystallographic consts. see (4) (5); for X-ray study of cryst. structure see (6) (7). — For 2.39% soln. of \bar{C} in CHCl₃, D_4^{23} = 1.48466 and n_D^{23} = 1.44883 (8).

[For prepn. of \bar{C} from naphthalene (1:7200) in equal wt. C_6H_6 with 4.3 wt. pts. SO_2Cl_2 refluxed 3 hrs. (15% yield) see (1); with Cl_2 as directed (45% yield (9)) (10) (11) (12); with $KClO_3$ + HCl see (13) (9); with dil. HOCl see (3); note that in all these methods numerous by-products are formed and it cannot be said that the prepn. is very satisfactory.]

Č on vigorous boilg. in small quantities evolves HCl and yields (14) 1,4-dichloronaphthalene (3:1655), m.p. 68°; with larger units numerous other prods. are also formed (14).

 \bar{C} (3 pts.) with aq. (100 pts.) boiled for 48 hrs. (15) gradually dissolves and the soln. after concn. deposits (65% yield (15)) a dichloroglycol ("dichloronaphthydreneglycol") [Beil. VI-971], cryst. from alc., m.p. 155-156° (diacetate, m.p. 130-131°; dibenzoate, m.p. 148-150°) (15).

Č with alc. KOH on boilg. yields (2) (16) (17) (18) (19) (20) mainly 1,3-dichloronaphthalene (3:1310), m.p. 61-62°, accompanied by some 1,4-dichloronaphthalene (3:1655), m.p. 68°, and a little 2,3-dichloronaphthalene (3:3665), m.p. 120°: note that the prod., m.p. 38°, supposed by the earlier workers to have been 1,3-dichloronaphthalene has been shown (19) to consist of a mixt. (possible mol. cpd.) of 1,3-dichloronaphthalene and 1,4-dichloronaphthalene.

 \bar{C} on oxidn. with 8.7 wt. pts. conc. HNO₃ (D=1.45) at 100° under reflux for $\frac{3}{4}$ hr gives (20) 2,3-dichloronaphthoquinone-1,4 (3:4857), m.p. 196° (20); but \bar{C} on oxidn. with boilg. HNO₃ also yields (21) (13) (presumably by further oxidn of the above precursor) phthalic acid (1:0820) and oxalic acid (1:0445).

C on oxidn. with CrO₃/AcOH yields (20) 2,4-dichloronaphthol-1 (3:3250), m.p. 106-107° (20).

[C with moist silver oxide in s t. at 200° yields (19) (9) a chloronaphthol, m.p. 130° (9), 2,3-dichloronaphthalene (3:3665), and other prods. (9).]

[\bar{C} on nitration with HNO₃ (D=1.5) at not above 30-35°, followed by htg. of prod. with MeOH/Na₂CO₃ or MeOH/NaHCO₃ in C₆H₆ at 130-150° (22) or with MeOH/NH₃ at ord. temp. (23), yields 5,8-dichloro-1-nitronaphthalene [Beil. V-556, V₂-(453)], m.p. 94° (22).]

[For conversion of \bar{C} to artificial resins by htg. with metal halides such as AlCl₃ or FeCl₃ (24), or by htg. with naphthalene + a surface cat. such as fuller's earth (25), see indic. refs.]

3:4755 2,3,3-TRICHLORO-2-METHYLBUTANE

M.P. 182-183° (1) abt. 170° (2)

[For prepn. of \tilde{C} from 2-chloro-2-methylbutane (3:7220) or from 2,3-dichloro-2-methylbutane (3:7975) with Cl_2 see (2); for formn. from 3-chloro-2-methylbutene-2 (3:7335) + Cl_2 (10% yield together with other prods.) see (1) (an earlier product (3) obtd. by this latter method and to which this structure was assigned was reported as a liquid, b.p. 176°, $D_1^{45} = 1.215$, $n_D^{21} = 1.472$).]

C is not (2) saponified by 20% aq. K₂CO₃.

 $\bar{\mathbf{C}}$ on htg. with 2 moles quinoline at 195–225° gives (60% yield (2)) β -chloroisoprene (3:7290).

3:4755 (1) Tishchenko, J. Gen. Chem. (U S S.R.) **8,** 1232-1246 (1938); Cent. **1939,** II 4223, C.A. **33,** 4190 (1939). (2) Tishchenko, J. Gen. Chem. (U.S S.R.) **6,** 1116-1132 (1936); Cent. **1937,** I 573; C.A. **31,** 1003 (1937). (3) Brochet, Ann. chem. (7) **10,** 385 (1897).

3:4775 3,4-DICHLORONAPHTHO-QUINONE-1,2

Red tbls. or ndls. from AcOH, C_6H_6 or CHCl₃. — Spar. sol. alc., fairly eas. sol. CHCl₃. — Sublimes undecomposed.

[For prepn. of \bar{C} from 1-aminonaphthol-2 hydrochloride [Beil. XIII-676, XIII₁-(274)], in AcOH with Cl₂ (68.5% yield (3)) (2) (4), or from naphthoquinone-1,2 (1:9062) in AcOH with Cl₂ (2), see indic. refs.; for formn. of \bar{C} from 3,4-dichloro-naphthoquinone-1,2-oxime-1 (3,4-dichloro-1-nitroso-naphthol-2) [Beil. VII-721] on oxidn. with conc. HNO₃ in AcOH soln. see (5); from 3,4-dichloro-3-nitro-1,2-dioxonaphthalene tetrahydride-1,2,3,4 [Beil. VII-701] with AcCl in s.t. at 100° see (6).]

Č dis. in cold dil. aq. alk. yielding colorless soln. which upon acidification gives (90% yield (4)) 1,2-dichloro-3-hydroxyındenecarboxylic acid-3 [Beil. X-325], ndls with 1 H₂O (from dil. HCl), m.p. 99–100° (4). [This prod. on oxidn. in dil. aq. or AcOH soln. with CrO₃ gives (34% yield (3)) (2) (4) 1,2-dichloroindene-1-one-3 ("dichloroindene") [Beil. VII-384], gold-yel. ndls. from alc. or AcOH, m p. 89–90°.] [For behavior of C̄ with Ca (OCl₂) soln. see (7).]

Č with alc. NaOEt yields (8) 3-chloro-4-ethoxynaphthoquinone-1,2, [Beil. VIII-299], or.-red ndls. from alc., m.p. 149° (8).

 \bar{C} in hot alc soln. on treatment with alc. NH₃ yields (2) 3-chloro-2-hydroxynaphtho-quinone-1,4-imide-4 (4-amino-3-chloronaphthoquinone-1,2) [Beil VIII-305], m.p. abt. 260° (2).

Č in dil. AcOH with excess SO₂ (2) reduces to 3,4-dichloro-1,2-dihydroxynaphthalene [Beil. VI-975], m.p. 125° (2).

[For cpd. formn. of \bar{C} with SnCl₄ see (9); for reactn. of \bar{C} with 2,3-dimethylbutadiene-1,3 in CHCl₃ see (10)]

3:4775 (1) Zincke, Ann. 257, 146–147 (1890). (2) Zincke, Ber. 19, 2499–2500 (1886). (3) Brass, Mosl, Ber. 59, 1271 (1926). (4) Zincke, Engelhardt, Ann. 283, 347–349 (1894). (5) Zincke, Schmuuk, Ann. 257, 146–147 (1890). (6) Zincke, Scharfenberg, Ann. 268, 303–304 (1892). (7) Zincke, Schmidt, Ber. 27, 744 (1894). (8) Hirsch, Ber. 33, 2414 (1900). (9) Brass, Fengler, Ber. 64, 1663–1664 (1931). (10) Fieser, Dunn, J. Am. Chem. Soc. 59, 1020 (1937).

Ndls. with 3 H₂O, m.p. 75° (1) from alc. or C_6H_6 (2); this trihydrate in vac. over H₂SO₄ loses 2 H₂O, the final H₂O at 110° (2). — \bar{C} is spar. sol in cold aq., C_6H_6 , CHCl₃, CCl₄, or CS₂; eas. sol alc., ether, or hot aq.

[For prepn. of \bar{C} from pyrogallol (1,2,3-trihydroxybenzene) (1:1555) in 60% AcOH with Cl₂ (2), or with SO₂Cl₂ in dry ether (3), see indic. refs.]

[For prepn. of \bar{C} from "leucogallol" [Beil VI-1078] or "mairogallol" [Beil VI-1078] by reduction with Zn dust + dil. H_2SO_4 see (1); from gallie acid (1:0875) in CHCl₃ with Cl₂ see (4).

[C in CCl4 or CHCl3 prev. satd. with Cl2 gives (2) "leucogallol."]

Č in other soln, with aq. Ba(OH)₂ gives deep blue coloration; with aq. Na₂SO₃ a fugitive red coloration (2).

C with aq. FeCl₃ gives (4) a blue coloration.

 \bar{C} with conc. HNO₃ is oxidized and decomposed (2); \bar{C} dis. in cold conc. H₂SO₄ without evoln. of gas but on warming decomposes (2).

C reduces NH₄OH/AgNO₃ (1).

- --- 4,5,6-Trichloropyrogallol triethyl ether: unreported.
- —— 4,5,6-Trichloropyrogallol triacetate: ndls. from dil. AcOH, m.p. 125° (4), 122° (1). [From C on short boilg. with Ac₂O (1) (4).]

436

3:4782 (1) Hantssch, Schniter, Ber. **20,** 2034-2037 (1887). (2) Webster, J. Chem. Soc. **45,** 205-208 (1884). (3) Peratoner, Condorelli, Gazz. chim. ital. **28,** I 225-226 (1898). 3:4790 2,3,4,5-TETRACHLORO-BENZOIC ACID

M.P. 186° (1)

Ndls. from alc. — Eas. sol. alc., ether; spar sol. aq.

[For prepn. of \tilde{C} from tetrachlorophthalic acid (3:4946) by htg. with 2-3 pts. AcOH in s.t. at 300° for 3-4 hrs. see (1); by htg. with steam + H₂ at 200-400° over decarboxylating cat. see (2).]

 \bar{C} on $\frac{1}{2}$ hr. boilg. with mixt. of 2 pts. HNO₃ (D=1.48) + 1 pt. conc. H₂SO₄ gives (100% yield (1)) 2,3,4,5-tetrachloro-2-nitrobenzoic acid [Beil. IX-405], lfts. from aq., but no m.p. has been reported.

Neither the action (if any) of PCl₅ or SOCl₂ on $\bar{\mathbb{C}}$ nor the expected 2,3,4,5-tetrachlorobenzoyl chloride has been recorded.

- Methyl 2,3,4,5-tetrachlorobenzoate: unrecorded.
- —— Ethyl 2,3,4,5-tetrachlorobenzoate: from \bar{C} + EtOH + HCl gas; ndls. alc., m.p. 34.5° (1).
- ---- 2,3,4,5-Tetrachlorobenzamide: unrecorded.
- --- 2,3,4,5-Tetrachlorobenzanilide: unrecorded.

3:4790 (1) Tust, Ber. **20**, 2439-2431 (1887). (2) Jaeger (to Selden Co.), U.S. 1,953,232, April 3, 1934; Cent. **1934**, II 669; C.A. **28**, 3743 (1934).

3:4810 2,3,4-TRICHLOROBENZOIC ACID

M.P. 186-187° (1)

Ndls. from hot aq. (1). — \bar{C} does not melt under boiling water (1).

[For prepn. from 2,3,4-trichlorotcluene (3:0425) by oxidn. with HNO₃ in s.t. at 150° see (1); from 2,3,4-trichlorobenzaldehyde (3:2445) by oxidn. with KMnO₄ see (2).] [The latter product was probably impure (1).]

No further data on C are recorded.

3:4810 (1) Cohen, Dakin, J. Chem. Soc. 81, 1328 (1902). (2) Seelig, Ann. 237, 150 (1887).

3:4820 3-CHLOROPHTHALIC ACID

M.P. 186-187° (1)

185-187° (2)

186° (3

184° (4) (5)

[See also 3-chlorophthalic anhydride (3:3900).]

Ndls. from aq.; eas. sol. alc.; eas. sol. ether (use in sepn. from phthalic acid (1:0820) (6). — 100 pts. aq. at 14° dis. 2.16 pts. \bar{C} (5). — [For sepn. of \bar{C} from o-chlorobenzoic acid (3:4150) by use of CHCl₃ see (7).]

[For prepn. of \bar{C} from 3-chlorophthalic anhydride (3:3900) by hydrolysis with boilg. dil. HCl see (3) (6); from 1,5-dichloronaphthalene (3:3200) by oxidn. with CrO₃/AcOH see (5); from 5-chloro-1,2,3,4-tetrahydronaphthalene [Beil. V₁-(237)] (1) by oxidn. with KMnO₄ see (1); from 3-chloro-2-methylbenzoic acid (3:4435) by oxidn. with KMnO₄ see (8).]

C on htg. above its m.p. yields (5) (8) 3-chlorophthalic anhydride (3:3900).

[\bar{C} on KOH fusion yields (8) (note rearrangement) 4-hydroxyphthalic acid [Beil. X-499, X_1 -(255)], m.p. 204-205°, with conv. to corresp. anhydride, m.p. 171°.]

 $[\bar{C}$ with steam passed over cat. at 350° loses CO₂ presumably yielding (9) o-chlorobenzoic acid (3:4150) and/or m-chlorobenzoic acid (3:4392).]

[C htd. with Hg(OAc)₂ in AcOH as directed (2) gives anhydro-2-hydroxymercuri-3-chlorobenzoic acid which on htg. with aq. HCl yields m-chlorobenzoic acid (3:4392).]

Salts. Ag₂Ā, ndls. from hot aq. (5); BaĀ, eas. sol. cold aq., but spar. sol. hot aq., on protracted boilg. with aq. gives monohydrate which is insol. cold aq. (8).

Esters. The neutral dimethyl and diethyl esters of \bar{C} are unreported: of the various possible acid esters only ethyl hydrogen 3-chlorophthalate, m.p. 118-119° (1), has been reported.

[See also 4.5-dichlorophthalic acid (3:4890).]

Tbls. or pr. from hot toluene or from CCl₄; spar. sol. cold but eas. sol. hot C₆H₆ or toluene; very little sol. in CCl₄.

[For prepn. of \bar{C} from 4,5-dichlorophthalic acid (3:4890) by htg. at 200° (4) or by htg. with AcCl (2) see indic. refs.; for formn. of \bar{C} (together with other isomers) from phthalic anhydride (1:0725) with Cl₂ in pres. of Fe or Fe salts at 160-260° (5), or from phthalic anhydride (1:0725) or 3-chlorophthalic anhydride (3:3900) with Cl₂ in fumg. H₂SO₄ in pres. of I₂ (4) (1), see indic. refs.; for formn. of \bar{C} from aq. solns. of alk. salts of phthalic acid (1:0820) with Cl₂ see (2) (6) (7).]

[For sepn. of C from isomeric dichlorophthalic anhydrides by means of salts of corresp.

acids, etc., see (4) (8) (1); by means of differential hydrolysis with H_2SO_4 (prods. with no α chlorine such as \bar{C} require H_2SO_4 of 98-100% concn., those with 1 α chlorine such as 3,4-dichlorophthalic anhydride hydrolyze with 56-95% H_2SO_4 , those with 2 α chlorine atoms such as 3,6-dichloro- or 3,4,5,6-tetrachlorophthalic anhydrides hydrolyze at H_2SO_4 concns. of less than 50%) see (9).]

C dislyd. in abs. alc. yields (4) ethyl hydrogen 4,5-dichlorophthalate, ndls from CHCl₃, m.p. 133-134° (4).

[Č with 1 mole NH₂OH.HCl + Na₂CO₃ in aq. soln as directed (4) yields 4,5-dichlorophthaloylhydroxylamine (N-hydroxy-4,5-dichlorophthalimide) [Beil XXI-504], pr from MeOH, m.p. 195–197° dec (4); this prod. on warming with aq Na₂CO₃ gives 100% yield 4,5-dichloro-2-aminobenzoic acid (4,5-dichloroanthranilic acid) [Beil XIV-368, XIV₁-(549)], m.p. 213–214° (4).]

[$\tilde{\mathbf{C}}$ with steam passed over cat. at 380–420° loses CO₂ presumably yielding (10) 3,4-di-chlorobenzoic acid (3:4925)]

 $\bar{\mathbb{C}}$ with benzene + AlCl₃ (12) or in acetylene tetrachloride (11) gives (98% yield (12)) 4,5-dichloro-2-(o-benzoyl)benzoic acid [Beil. X_1 -(357)], cryst. from C_6H_6 (12) or toluene (11), m.p. 209° (12), 208° (11), which on htg. with 20 pts cone H_2SO_4 at 160° for 1 hr. gives (92% yield (12)) (11) 2,3-dichloroanthraquinone [Beil. VII-788, VII₁-(413)], yellowish ndls. from AcOH, m.p. 267° cor. (12), 265° (11). — $[\bar{\mathbb{C}}$ with o-xylene + AlCl₃ in acetylene tetrachloride gives (80% yield (11)) 4,5-dichloro-2-(3',4'-dimethylbenzoyl)benzoic acid, cryst. from cyclohexane, m.p. 184° (11), which with 10 pts. conc. H_2SO_4 at 100° gives (45% yield (11)) 6,7-dichloro-2,3-dimethylanthraquinone, cryst from xylene, m.p. 305° (11) — $\bar{\mathbb{C}}$ with o-dichlorobenzene (3:6055) + AlCl₃ 4 hrs. at 100° gives (80% yield (11)) 3,4-dichloro-2-(3',4'-dichlorobenzoyl)benzoic acid, cryst. from C_6H_6 , m.p. 183°, which with 12 pts. conc. H_2SO_4 6 hrs. at 100° gives mainly 2,3,6,7-tetrachloroanthraquinone, cryst. from o-dichlorobenzene, m.p. 348° (11) — For analogous reactns of $\bar{\mathbb{C}}$ with naphthalene (13), pyrene (14), or o-chlorotoluene (15) see indic. refs.]

[\bar{C} with hydroquinone (1:1590) + H_3BO_3 htd at 190° and afterward treated with hot conc. H_2SO_4 at 150–165° (16), or \bar{C} with $AlCl_3$ + NaCl htd at 200–220° (17), or \bar{C} with p-chlorophenol (3:0475) htd. with fumg. H_2SO_4 + H_3BO_3 (18) gives (yield: 80% (17), 15% (16)) 6,7-dichloro-1,4-dihydroxyanthraquinone (6,7-dichloroquinizarin) [Beil. VIII-452, VIII₁-(716)], red-br. cryst from xylene, m.p. 295.5° (17), 288° (16), (diacetate, m.p. 125° (16), dimethyl ether, m.p. 168 5° (17))]

[For use of \bar{C} in preparation of pigments of the copper phthalocyanine type see (19)]

 \bar{C} with $(NH_4)_2CO_3$ htd. at 250° for $\frac{1}{2}$ hr (20) yields 4,5-dichlorophthalimide, pl from alc., m.p. 221° (20) (note that behavior of \bar{C} with cone aq. NH_4OH is different yielding (4) 4,5-dichlorophthalamic acid (not specifically characterized) which with alk. NaOCl gives 4,5-dichloro-2-aminobenzoic acid (above)). — [For behavior of \bar{C} with hydrazine hydrate in AcOH yielding corresp. cyclohydrazide see (21)]

Č (1 pt) in boilg. AcOH (6 pts.) treated with and (1 pt.) gives (82% yield (1)) 4,5-dichlorophthalanil (N-phenyl-4,5-dichlorophthalimide) [Beil. XXI₁-(391)], cryst. from AcOH, m.p. 212.5-213° cor. (1).

Č on saponification with standard alkali (Sap. Eq. = 108.5), followed by acidification, yields 4,5-dichlorophthalic acid (3:4890) q.v

White cryst with camphoraceous odor which readily sublime without melting. — Cryst. from alc, ether, CHCl₃ or CS₂. — \bar{C} is trumorphous: below about 46° cryst \bar{C} is orthorhombic, in range 46–71° cryst \bar{C} is truclinic; about 71° cryst \bar{C} is cubic, at these transition temps volume alterations occur which have sometimes (5) been mistaken for mp.'s. — [For details on trimorphism and these transitions see (19) (8) (20) (21) (25) (26); for influence of high press, see (22) — For crystallographic data see (20) (23) (24); for X-ray crystallog. data see (27) (28)]

 \bar{C} is almost abs. insol aq. and vice versa at ord temp (29); for patents on drying of \bar{C} see (30) (31) — [For studies of vap press. of \bar{C} at various temps, see (13) (4) (7) (32). — For prevention of "caking" of cryst. \bar{C} by addn. of 1-10% paraformaldehyde see (33).]

Cryoscopic const. of \bar{C} , i.e, f.p. lowering per mole solute in 100 g. \bar{C} , is 5.6° (34). [For thermal anal. of binary systems of \bar{C} with naphthalene (1:7200) (8) (34), with phenanthrene (1:7240) (34), or with anthracene (1:7285) (34) see indic. refs.]

USES OF C

 \bar{C} finds many uses in industry, some based on its physical characteristics and some on its chem. behavior. — [E.g., for use of \bar{C} as solvent for prepn. of solid solns. of I_2 for use in place of usual tincture see (35); for use of \bar{C} as means for temporary marking of cloth removable at will by heat (sublimation) see (36).]

[For use of \bar{C} as addition agent to CCl₄ fire extinguishers see (37); as component of certain types of explosives (e.g., 75% nitrostarch + 20% \bar{C} + 5% NaNO₃) see (38); for use of \bar{C} as mothproofing agent see (39) (40) (41) (42); for use of \bar{C} as insecticide and/or fungicide see (43) (44); for use of \bar{C} together with CS₂ (45) or rotenone (46) as insecticides see indic. refs.]

 \tilde{C} is an important component of "HC" smoke candles or grenades used for the production of screening clouds or smokes; a mixture of \tilde{C} with powdered metal (usually Zn) once started undergoes vigorous decomposition yielding ZnCl₂ + C; other materials are usually added to ignite the mixture and to modify the character of the resultant smoke; for further details see (47) (48) (49). — [For use of this type of reactn. in prepn. of activated carbon see (153).]

PHYSIOLOGICAL ASPECTS OF C

[For studies of toxicity of \bar{C} and its ability to penetrate skin see (50) (51) (52) cf. (160); for studies of \bar{C} as anthelmintic see (53) (54); for study of antiseptic power of \bar{C} see (55).]

DETERMINATION OF C

For detn. of \tilde{C} by reactn. with Na + ethanolamine in dioxane followed by detn. of resultant chloride ion see (161).

PREPARATION (OR FORMATION) OF C

 $\bar{\mathbf{C}}$ is a by-product of the tech. prepn. of CCl₄ (5:5100) from CS₂ + Cl₂ (56), of prepn. of CHCl₃ (3:5050) and of CH₂Cl₂ (3:5020) (57), and is found (12) (together with other by-products) in the high-boilg. fractn. ("Tri-Nachlauf") from the prepn. of trichloroethylene (3:5170) from acetylene tetrachloride (3:5750). — For quick prepn of $\bar{\mathbf{C}}$ from CCl₄ (3:5100) refluxed with Al powder (80% yield (14)) or with Al/Hg (65% yield (58)) cf. (96) see indic. refs.; for prepn. of $\bar{\mathbf{C}}$ from ethylene with Cl₂ over activated carbon at 300–350° (90% yield) see (59). — For many other methods of preparation, manufacture, or formation see below.

From various polychloroethanes. From 1,2-dichloroethane (ethylene dichloride) (3:5130). [For prepn. of \bar{C} from ethylene dichloride in vapor phase with $Cl_2 + cat$. (60) (61) or with Cl_2 under press. (62) see indic. refs.; note that ethylene dichloride in liq. phase with Cl_2 gives mainly (61) 1,1,2-trichloroethane (3:5085). — Note also that 1,2-dibromoethane (ethylene dibromide) refluxed with $AlCl_3$ while treated with Cl_2 (63) gives \bar{C} .]

From 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750). [For formn. of C together with other prods. from acetylene tetrachloride over pumice at 700° (64), or with anhydr. FeCl₃ on htg. in s.t. (65), or with Cl₂ (66) in u.v. light at 50-60° (67) or X-radiation (68), or with Cl₂ over activated carbon at 300-400° (69) (70) or at 60-70° (71), or with Cl₂ in pres. of AlCl₃ at 20-100° (71) or at 120° under reflux (80% yield (72)), or with Cl₂ in pres. of Fe at 20-80° (71), or with Cl₂ in CCl₄ soln. (73), or even with aq. bleaching powder (71), see indic. refs. — (Note also that acetylene tetrabromide with AlCl₃ + Cl₂ under reflux yields (63) C̄).]

From pentachloroethane (3.5880). [For formn. of \bar{C} together with other prods. from pentachloroethane with dry $Cl_2 + AlCl_3$ at 70° (74), or with Cl_2 over activated carbon at 300-400° (70), or with Cl_2 in u.v. light (67), or with excess F_2 at 90° for 10 hrs. (16), see indic. refs. — (Note also that pentabromoethane with $SbCl_5$ in s.t. at 160° for 2 hrs. gives (75) \bar{C} .)]

From various polychloroethylenes (or acetylenes). From trichloroethylene (3:5170). [For formn. of \tilde{C} together with other products from trichloroethylene by pyrolysis over

pumice at 700° (64), or with anhydrous FeCl₃ on htg. in s.t. (65), or with Cl₂ over act. carbon at 60-70° (98% yield (70)), see indic. refs.]

From tetrachloroethylene (3:5460). [For prepn. and/or formn. of \bar{C} from tetrachloroethylene with Cl₂ (162) (76) (77) in direct sunlight (78) cf. (79) (80) (106) or in pres. of suitable cat. in dark at 80-100° (81), or in CCl₄ soln. at 22° (82) cf. (73) or in vapor phase at 40° and low press. in light and absence of oxygen (33) see indic. refs. (note that tetrachloroethylene (3:5460) with Cl₂ + light in presence of O₂ undergoes photo-oxidation to trichloroacetyl chloride (3:5420)). — For formn. of \bar{C} from tetrachloroethylene with SO₂Cl₂ in pres. of dibenzoyl peroxide (84), or in small amt. with dibenzoyl peroxide alone (85), or with chlorine monoxide in CCl₄ at -20° (86), see indic. refs.] See also below under formn. of \bar{C} from acetylene.

From dichloroacetylene (3:5010). [For form. of \bar{C} from dichloroacetylene with Cl_2 in CCl_4 soln. see (2).]

From various polychloromethanes. From trichloromethane (chloroform) (3:5050). [For formn. of C together with other prods. from CHCl₃ by pyrolysis at 425° (87), in electric arc (6), by actn. of radium radiation (88), or by actn. of NCl₃ in sunlight (89) see indic. refs.]

From carbon tetrachloride (3.5100). [For formn. of \bar{C} together with other prods. from CCl₄ by pyrolysis at 600–1500° (90) cf. (91) (76), by actn. of electric arc (6), dark electric discharge (92), or radium radiation (88), with hydrogen at 600–650° (93), or with hydrogen over reduced Ni at 270° (94), or from CCl₄ in nitrogen over GeO₂ at 500–865° (95), see indic. refs.]

[For prepn. of \overline{C} from CCl₄ (3:5100) by refluxing with Al powder (80% yield (14)), Al/Hg (65% yield (58)), or Al + AlCl₃ (96), or by htg. with Cu powder in s.t. at 120° (97), amorphous As in s.t. at 160° (98), or molecular Ag in s.t. at 200° (99), see indic. refs.]

From various hydrocarbons. From methane. [For formn. of \tilde{C} together with other prods. from $CH_4 + Cl_2$ in silent elec. discharge see (100).]

From ethane. [For form. of C together with other prods. from ethane with Cl₂ in pres. of activated carbon or other cat. at elev. temp. see (101) (102) (103).]

From ethylene. [For form. of C together with other prods. from ethylene with Cl₂ over act. carbon at 120-125° (104) or at 300-350° (90% yield (59)) cf. (101) (105).]

From acetylene. [For formn. of \bar{C} together with other prods. from acetylene with Cl₂ at 650-1000° as directed (106) or at 700-950° as directed (107), with Cl₂ in an inert gas such as N₂ or HCl over act. carbon at elev. temp. (108), or with S₂Cl₂ in pres. of 1-2% reduced iron (109) (110) see indic. refs. — (Note that by this mode of procedure acetylene tetrachloride (see this heading above) is a probable intermediate.)]

From miscellaneous sources. C has been observed as one of the products of decomposition of many different types of compounds contg. the —CCl₃ group. [For example, for formn. of C (together with other prods.) from iodotrichloromethane on distn. (111), from bromotrichloromethane in ultraviolet light (112), from trichloroacetyl chloride (3:5420) at 600° (113), from trichloroacetyl bromide in s.t. at 400° (113), from trichloroacetyl iodide on distn. at ord. press. (113), from nitrosotrichloromethane with O₂ at 120° (114), or from nitrotrichloromethane (chloropicrin) with HCl gas over pumice at 400° (1) see indic. refs. — For formn. of C together with other prods. from trichloroacetaldehyde (chloral) (3:5210) with Cl₂, Br₂, or I₂ in pres. of AlCl₃ (115), from trichloroacetic acid (3:1150) by pyrolysis over ThO₂, kaolin, or carbon (116), from K trichloroacetate by electrolysis of its soln. in aq. KOAc (15), from ferric trichloroacetate in aq. soln. in light (117) (118) (119), from pentachlorodimethyl ether on htg. with aq. (120), or from trichloromethyl benzoate on htg. (121) see indic. refs.]

The forms. of C has also been observed in connection with certain acid chlorides [e.g.,

for formn. of C from acetyl chloride (3:7065) with excess PCl₅ in s.t. at 180° (122), from pentachloropropionyl chloride (3:0470) with AlCl3 on warming (123), from dichloromalcyl (di)chloride (3:6197) with PCl₅ at 230° for 6 hrs. (124), or from pentachloroethyl chloroformate with AlCl₃ at 100° (125) see indic. refs.]

[For formn. of C from various alkanes with SbCl₅ + I₂ (126), from a mixt. of dichloropropanes or from hexachlorobutadiene (3:6425) with Cl2 at 400° and 30 atm. (127), from an electric arc between carbon electrodes in Cl₂ (128), from n-propyl chloride (3:7040) or isobutyl chloride (3:7135) with excess ICl₃ in s t. at 200° (129), from CaC₂ with gaseous or liq. Cl2 at 20° under press. (10), from various iodochlorides of ethylene on warming (9), from lignin on boilg. with SbCl₅ + I₂ (130), from humic acid with KClO₃ + HCl (131), from β, β' -dichlorodicthyl sulfide ("mustard gas") with dry Cl₂ at 100° (132), or from $\alpha,\alpha,\beta,\beta,\beta,\beta'$ -hexachlorodiethyl sulfide or $\alpha,\alpha,\beta,\beta,\beta,\alpha',\beta'$ -heptachlorodiethyl sulfide with Cl₂ in cold (133) see indic. refs.]

CHEMICAL BEHAVIOR OF C

Pyrolysis. [C passed over porcelain in hot tube gives (78) tetrachloroethylene (3:5460); $\bar{\mathbf{C}}$ (in stream of air) pyrolyzed at 550–600° gives (57) tetrachloroethylene (3.5460) +CCl₄ (3:5100) in conversions of substantially 100% — Note also that C with SbCl₅ above 450° yields almost exclusively (126) CCl₄ (3:5100).]

Reduction. C with granulated Zn in boilg, alc. (134), with Zn + dil. H₂SO₄ at room temp. for several days (100% yield (135)) (136) (76), with $Z_n + aq$. above 80° (137), with H₂ over Ni at 270° (138), or with alc. KSH (139) loses 2 chlorine atoms giving tetrachloroethylene (3:5460) [for other, less direct conversions of C to tetrachloroethylene see latter under preparation; also below.)]

Oxidation. C is oxidized only with considerable difficulty [e.g., for behavior of C over hot CuO see (140); for detn. of chlorine in C by cat. oxidn over Fc₂O₃ (low results) see (141); C with CrO₃/H₂SO₄ is incompletely oxidized (142); C with SO₃ in s.t. at 150° (143) cf. (144) yields trichloroacetyl chloride + S₂O₅Cl₂]

Partial replacement of chlorine by fluorine. [C with F_2 gas over Cu gauze cat. at 125° (145), or with SbF₃Cl₂ htd. under press. (146) (147) (148), or with SbF₃ + Cl₂ + SbCl₃ as directed (149) yields 1,1,2,2-tetrachloro-1,2-difluoromethane, mp. 24-25°, b.p. 92°, accompanied by numerous other partially fluorinated prods |

Behavior with alkalies. [C with solid KOH in s.t. at 210-220° for several days yields (150) KCl + potassium oxalate; C with alc. KOH in s.t. at 100° for a week yields (151) the same prods. accompanied by ethylene and hydrogen; C with N/10 abs EtOH/NaOH at 25° (17), with alc.-free NaOEt in other under press. htd. to 140° (152), yields tetrachloroethylene (3:5460) (for study of kinetics see (17)).]

Behavior with metals. [C with alk. or alk.-earth metals is (like many other polychloro compounds) subject to explosion by mechanical shock; for study of sensitivity of C with Li, Na, K, Mg, Ca, Sr, Ba, Al, or Tl see (154). — C with "molecular" Ag at 280° loses 2 atoms of chlorine yielding (99) tetrachloroethylene (3:5460).]

Behavior with organometallic compounds. [For behavior of C with RMgX compds. see (155) (166); \overline{C} does not (11) react with Hg di-(p-tolyl)

Behavior with NH₃ or organic bases. [C with NH₃ at 700-800° gives up its halogen quant. (157) yielding NH₄Cl. — C with excess phenylhydrazine in xylene soln. on stdg. or on warming is reduced to tetrachloroethylene (3:5460), HCl, C₆H₆, and N₂ also being formed (158) (note that analogous reactns. are also shown by 1,1,2,2-tetrachloroethane (3:5750) and by pentachloroethane (3:5880)). — For kinetics of reactn. of \tilde{C} with pyridine or piperidine see (159).]

3:4840 3,5-DICHLOROBENZOIC ACID
$$C_7H_4O_2Cl_2$$
 Beil. IX - 344 IX₁-(141)

Ndls. from alc. — Sublimes (10). — Very eas. sol. alc., spar. sol. aq. or lgr.

[For prepn. from 3,5-dichlorotoluene (3:6310) by oxidn. with dil. HNO₃ at 150–170° see (8) (7); from 3,5-dichlorobenzaldehyde (3:1475) by oxidn. with KMnO₄ (74% yield) see (3); from 3,5-dichlorobiphenyl (3:0360) by oxidn. with CrO₃ + AcOH see (9): for prepn. from 3,5-diamnobenzoic ac. via diazo reactn see (1); from 4-amino-3,5-dichlorobenzoic ac. via diazo reactn. see (2); from 3,5-dichloroaniline via conv. to acid hydrolysis of the nitrile see (10); for prepn. from 5-nitro-3-sulfobenzoic acid via PCl₅ and subsequent boilg. with alk. see (11)

 \bar{C} added to 8 pts. fumg. HNO₃ (D=1.48), stood 2-3 hrs. at 70°, cooled, ppts. 75% yield 2-nitro-3,5-dichlorobenzoic ac., ndls. from dil. alc, m.p. 194° cor. (5). [This prod. depresses m.p. of \bar{C} (5).]

C with PCl₅ yields (12) 3,5-dichlorobenzoyl chloride, b.p. 135-137° at 25 mm. (12).

- --- Methyl 3,5-dichlorobenzoate: m.p. 58° (13).
- Ethyl 3,5-dichlorobenzoate: m.p. unrecorded. [For study of velocity of hydrolysis see (14).]
- --- 3.5-Dichlorobenzamide: unrecorded.
- --- 3.5-Dichlorobenzanilide: ndls. from dil. alc., m.p. 148° (15).

3:4845 6-CHLORONAPHTHOIC ACID-1

COOH C₁₁H₇O₂Cl Beil. S.N. 951

M.P. 189° cor. (4) 188-189° (1) (2) Cryst. from C6H6 or 95% alc.

[For formn. of \bar{C} from furoic acid (1:0475) + chlorobenzene (3:7903) + AlCl₃ (18% yield (2)) (3) or from methyl furoate (1:3452) + chlorobenzene (3:7903) + AlCl₃ (yield 39% (1)) see indic. refs.]

C on decarboxylation by htg. in quinoline at 225° in pres. of copper chromite cat. for 4 hrs. yields (2) 2-chloronaphthalene (3:1285), m.p. 58-59° (2).

- Methyl 6-chloro-1-naphthoate: b p. 165-170° at 2 mm. (1). [From methyl furoate (1:3452) + chlorobenzene (3:7903) + AlCl₃ (15% yield (1)).]
- Ethyl 6-chloro-1-naphthoate: unreported.
- D p-Bromophenacyl 6-chloro-1-naphthoate: mp. 142-143° cor. (4).

3:4845 (1) Price, Huber, J. Am. Chem. Soc. 64, 2139 (1942). (2) Price, Chapin, Goldman, Krebs, Shafer, J. Am. Chem. Soc. 63, 1857, 1861 (1941). (3) McCorkle, Turck, Proc. Iowa Acad. Sci. 43, 205-206 (1936), Cent. 1938, II 1950, C.A. 32, 4161 (1938). (4) Horn, Warren, J. Chem. Soc. 1946, 144.

3:4850 PENTACHLOROPHENOL

Cryst. from alc. as monohydrate, $\bar{C}.H_2O$, m.p. 174°; anhydrous ndls from C_6H_6 ; sublimes in long ndls. — Very insol. aq. (17), very eas. sol. alc., ether; mod. sol. C_6H_6 ; spar. sol. cold lgr.; for quant data on solubility in 15 solvents at 7 temps. from 0° to 60° see (1) (17). — Odor pronounced only on htg; dust of \bar{C} causes sneezing — Slightly volatile with steam.

[For general review see (1), for use as wood preservative see (17) (19); for studies on toxicity see (20) (21); for fate of \bar{C} in organism see (22)]

[For prepn. see Beil. VI-194, VI₁-(104); for comml prepn. from hexachlorobenzene (3:4939) + NaOH + MeOH see (12) cf. (23); from chlorination of phenol or polychlorophenols in pres. of AlCl₃ see (13), from "hexachlorophenol" (3:3180) by reduction with SO₂ in alc see (18).]

 \bar{C} is acidic and in alc. soln. titrates quant. using thymol-blue (Neut. Eq. = 266.5) (1). [For dissoc. const. see (2).] — \bar{C} is insol. in NH₄OH (1) but slowly dis. in cold Na₂CO₃ soln. (8). — \bar{C} in alk. soln. does not couple with diazonium salts. [For spectrophotometric detn. see (11).]

Salts. See Beil. VI-194. Na\(\bar{A}\), ndls. (from acctone + lgr), spar sol. aq. (3), Na\(\bar{A}\). H₂O, loses aq. at 110°, sol. aq., alc., ether. [For comml. application as preservative see (1) (14).] — Ag\(\bar{A}\), yel. ppt. turning orange on drying. — Heavy metal salts insol. aq. and often colored (1).

 \tilde{C} in alk. shaken with $(CH_3)_2SO_4$ (6), or \tilde{C} treated with diazomethane (6), or \tilde{C} htd. in MeOH with $CH_3I + KOH$ (15), yields its methyl ether, pentachloroanisole, ndls. from alc., m.p. 108° (6), 106.5° (6).

Dentachlorophenyl acetate: from \tilde{C} on htg. with Ac₂O + NaOAc (15) or from \tilde{C} in CS₂ + AcCl + AlCl₃ (16); ndls. from alc., m.p. 149.5-150 5° (16), 147-148° (15). [This prod. is very resistant to saponification (16).]

- D Pentachlorophenyl benzoate: from C + BzCl by warming in pyridine (3); ndls. from alc., m.p. 164-165° (3), 159-160° (15), 159° (10). [Very resistant to saponification (16).]

3:4853 CHLOROFUMARIC ACID Cl—C—COOH C₄H₃O₄Cl Beil. II - 744 Π_{1-} (302) Π_{2-} (640)

M.P.	193°	(1)	
	192°	(2)	(3) (4)
	191.5-192.5° cor. (5)		
	191.5°	(6)	
	191-192°	(22)	
	191°	(8)	(10) (19)
	190–191°		(12)
	189°	(11)	
	188-189°	(14)	

[See also chloromaleic acid (3:3432).]

Tbls from AcOH. — \tilde{C} is very cas sol aq., alc. or ether; spar. sol. C_6H_6 or lgr. — \tilde{C} sublimes without forming anhydride

[For prepn of $\bar{\rm C}$ from chloromaleic acid (3.3432) by repeated evapn, with cone. HCl see (5) (2); from $d_i l_i - \alpha_i \alpha'_i$ -dichlorosuccime acid (3:4711) on boilg, with aq (7), or with aq. KOH (8) (9) or aq acid (9) see indic 1efs; from $meso_i - \alpha_i \alpha'_i$ -dichlorosuccinic acid (3:4930) with aq. KOH at 0° see (7) (8) (9) (note that from this source action of acid yields (9) both $\bar{\rm C}$ and chloromaleic acid (3:3432)); from diethyl $d_i l_i - \alpha_i \alpha'_i$ -dichlorosuccinate (3:9578) on hydrolysis with boilg. 30% H₂SO₄ see (1); from diethyl chlorofumarate (3:6864) by evapn, with 1°1 HCl see (6); from chlorofumaro(di)nitrile (b.p. 172° at 74 mm., 64.0–64.2° at 10 mm., $D_i^{20} = 1.2499$, $n_i^{20} = 1.49571$ (22)), by hydrol. see (22).]

[For formn. of $\bar{\rm C}$ from diethyl oxaloacetate [Beil. III-782, III₁-(273), III₂-(479)] by actn. of PCl₅ followed by alc. KOH see (11); from acetylenedicarboxyhc acid [Beil. II-801, II₁-(317), II₂-(670)] with conc. HCl on stdg. 10 days at room temp. see (12) cf. (13); from 3-chlorofuroic acid [Beil. XVIII-282] on oxidn. with dil. HNO₃ or from 3,5-dichlorofuroic acid [Beil. XVIII-283] or 4,5-dichlorofuroic acid [Beil. XVIII-283] on oxidn. with Br₂/aq. see (14).]

 $\ddot{\mathbf{C}}$ on gentle boilg. largely decomposes into $\mathbf{CO}+\mathbf{CO_2}+\mathbf{HCl}$ (5); but $\ddot{\mathbf{C}}$ on vigorous boilg. splits off aq. and isomerizes (or vice versa) yielding (5) chloromaleic anhydride (3:0280). — $\ddot{\mathbf{C}}$ with $\mathbf{P_2O_5}$ (6) (15), or with $\mathbf{POCl_3}$ (16) or with \mathbf{AcCl} (5), gives on distn. chloromaleic anhydride (3:0280). — $\ddot{\mathbf{C}}$ (1 mole) with chlorofumaryl (di)chloride (3:6105) (1 mole) at 125° for 1 hr. also yields (17) chloromaleic anhydride (3:0280).

 $[\bar{C} \text{ (as } K_2\bar{A}) \text{ in aq. soln. with Na/Hg is dehalogenated and reduced yielding (18) succinic acid (1:0530).]}$

Č readily reduces aq. KMnO₄.

[\bar{C} in aq. soln on protracted treatment with Cl₂ gives (19) β,β,β -trichloro- α,α -dihydroxy-propionic acid ("trichloropyruvic acid hydrate") [Beil. III-623, III₂-(408)], ndls. from CHCl₃, m.p. 102° (19). — \bar{C} does not (5) add Br₂ even at 100° (dif. from chloromaleic acid (3:3432)).]

Č behaves normally as a dibasic acid: e.g., titration with standard dil. aq. alk. gives Neut. Eq. 75.3; for study of electrometric titration see (2).

[Salts. (NH₄)₂Ā, eas. sol. aq. (5), but spar. sol. MeOH, EtOH, and insol. in ether, acetone, AcOEt, CHCl₃, or C₆H₆ (20) see indic. refs. — KHĀ, much less sol. than corresp. prod. from chloromaleic acid, e.g., 100 g. of its satd. soln. at 15° conts. 3.843 g. KHĀ (5). — Ag₂Ā (10) (12). — BaĀ.3H₂O, fairly sol. aq. (10). — PbĀ.2H₂O (13).]

[Č on stdg. at ord. temp. with slight excess 0.76 N aq. KOH gives chlorine ion about 40 times as fast (12) as the isomeric chloromaleic acid (3:3432).]

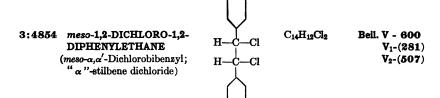

The acid (di)chloride corresp. to C, viz., chlorofumaryl (di)chloride (3:6105), has been reported only by indirect means.

- Dimethyl chlorofumarate: oil (see 3:6582).
- —— Diethyl chlorofumarate: oil (see 3:6864).
- **bis-(p-Nitrobenzyl)** chlorofumarate: m.p. 138.5° (21). [From Na₂\bar{A} with p-nitrobenzyl bromide in 63% ale. refluxed 2 hrs. (21).]
- Chloromaleanii [N-phenyl-chloromaleinimide]: ndls. from boilg. alc., m.p. 170° (17). [From aniline salt of \bar{C} on htg. for a few minutes at 170°-180°; note that during the process isomerization occurs and therefore that the prod. is the same as similarly obtd. from chloromaleic acid (3:3432) q.v.]
- © Chlorofumaro-bis-(p-bromoanilide): faintly yel. ndls. from boilg. alc., m.p. 236° (17). [From chlorofumaryl (di)chloride (3:6105) with p-bromoaniline (4 moles) in dry ether; note that crude prod. is also accompanied by a little N-(p-bromophenyl)-chloromaleinimide, m.p. 190° (17).]

(20)

Colorless ndls. from alc., AcOH, C6H6, toluene, or lgr. — Spar. sol. hot alc., eas. sol. hot toluene. — Sublimes.

PREPARATION OF C

FROM BINUCLEAR INITIAL MATERIALS

From stilbene (trans-1,2-diphenylethylene). [For prepn. of \bar{C} from 1,2-diphenylethylene (stilbene) (1:7250) with Cl₂ in CHCl₃ (8) (16), with Cl₂ in ether in sunlight (17) (some " β "-stilbene dichloride (3:2570) is also formed), with Cl₂ in ethane soln. (note low temp.) in sunlight (gives 34.4% yield \bar{C} + 48.7% yield diastereomer (3:2570) (15)) see indic. refs.; with PCl₅ (2 moles) in CHCl₃ soln. (6) or with PCl₅ in POCl₃ in s.t. at 170° (2) see indic. refs.; with SO₂Cl₂ in presence of peroxides at room temp. (yield of crude mixt. is 100%; sepn. of isomers gives 45% \bar{C} + 33% diastereomer (3:2570) (7)), with nitryl chloride (CINO₂) in ether (57% yield (18)), see indic. refs.]

From isostilbene (cis-1,2-diphenylethylene). [For prepn. of \bar{C} from isostilbene with PCl₅ in C_6H_6 stood 2 days at room temp. see (6).]

From bibenzyl. [For formn. of C from bibenzyl (1:7149) with chromyl chloride (CrO₂Cl₂) in CS₂ (other prods. are also formed) see {19}.]

From α, α' -dibromobibenzyl (stilbene dibromide). [For formn. of \bar{C} from the higher-melting diastereomer (m.p. 236°) of stilbene dibromide [Beil. V-602, V₁-(282), V₂-(508)] with SnCl₄ in C₆H₆ on refluxing $\frac{1}{2}$ hr. (5) (note that at ord. temp. replacement is only

partial and yields (5) only stilbene chlorobromide, m.p. 225°) or with HgCl₂ in acetone/CHCl₃ refluxed 11 hrs. (poor yield (11)) see indic. refs.]

From
$$\alpha,\alpha'$$
-dihydroxybibenzyl (C_6H_5 — C — C — C_6H_5).

From meso-hydrobenzoin. [For prepn. of \bar{C} from meso-hydrobenzoin [Beil. VI-1003, VI₁-(490)] with PCl₅ (2 moles) (20) cf. (15) (yield 43% \bar{C} + 22% diastereomer (3:2570) (8) (16)), with PCl₃ (8) (16), or with SOCl₂ in C_6II_6 + pyridine (100% yield (10)) (13) see indic. refs.]

From d,l-hydrobenzoin (isohydrobenzoin). [For prepn. of \bar{C} from isohydrobenzoin [Beil. VI-1004, VI₁-(490)] with PCl₅ (27-32% \bar{C} + much resin (8)) (16) (20) or with PCl₅ (8) (16) see indic. refs.; note, also, that l-isohydrobenzoin with PCl₅ in CHCl₃ refluxed 2 hrs. gives (45% yield (1)) \bar{C} .]

From α -chloro- α' -hydroxybibenzyl. [For formn. of \bar{C} from α -chloro- α' -hydroxybibenzyl (m.p. 77°, corresp. p-nitrobenzoate, m.p. $103-104^{\circ}$ (3)) with SOCl₂ in CHCl₃ see (3); note that by this method \bar{C} is formed exclusively.]

From α -amino- α' -hydroxybibenzyl. [For prepn. of $\bar{\bf C}$ from d_il - α -amino- α' -hydroxybibenzyl with PCl₅ (42% yield (21)) or with NOCl (1) see indic. refs; note also that d- α -amino- α' -hydroxybibenzyl in HCl with NOCl gives (1) 13% $\bar{\bf C}$ + 24% of l-"stilbene dichloride (3:2570) while l- α -amino- α' -hydroxybibenzyl in HCl with NOCl gives (1) 14% $\bar{\bf C}$ + 17% d-" β "-stilbene dichloride (3:2570).]

From Mononuclear Initial Materials

From benzal (di)chloride. [For formn. of \bar{C} from benzal (di)chloride (3:6327) by bimolecular reduction with $II_2 + Pd$ in alc. soln. (22), or with $II_2 + Pd$ in alc. soln. (22), or with $II_2 + Pd$ in alc. soln. (22), or with $II_2 + Pd$ in alc. soln. (22), or with $II_2 + Pd$ in alc. soln. (22), or with $II_2 + Pd$ in alc. soln. (22), or with $II_2 + Pd$ in alc. soln. (22), or with $II_2 + Pd$ in alc. soln. (22), or with $II_2 + Pd$ in alc. soln. (23), or with excess $II_2 + Pd$ in alc. (24), or by action of $II_2 + Pd$ in alc. (25), soln. (25), soln. (26), all $II_2 + Pd$ in alc. soln. (26), or with $II_2 + Pd$ in alc. soln. (26), or with $II_2 + Pd$ in alc. soln. (27), or with $II_2 + Pd$ in alc. soln. (27), or with $II_2 + Pd$ in alc. soln. (28), or with $II_2 + Pd$ in alc. soln. (29), or with $II_2 + Pd$ in alc. soln. (29), or with $II_2 + Pd$ in alc. soln. (21), or with $II_2 + Pd$ in alc. soln. (21), or with $II_2 + Pd$ in alc. soln. (21), or with $II_2 + Pd$ in alc. soln. (21), or with $II_2 + Pd$ in alc. soln. (21), or with $II_2 + Pd$ in alc. soln. (21), or with $II_2 + Pd$ in alc. soln. (21), or with $II_2 + Pd$ in alc. soln. (22), or with $II_2 + Pd$ in alc. soln. (22), or with $II_2 + Pd$ in alc. soln. (22), or with $II_2 + Pd$ in alc. soln. (23), or with $II_2 + Pd$ in alc. soln. (24), or with $II_2 + Pd$ in alc. soln. (25), or with $II_2 + Pd$ in alc. soln. (25), or with $II_2 + Pd$ in alc. soln. (26), or with $II_2 + Pd$ in alc. soln. (26), or with $II_2 + Pd$ in alc. soln. (27), or with $II_2 + Pd$ in alc. soln. (28), or with $II_2 + Pd$ in alc. soln. (28), or with $II_2 + Pd$ in alc. soln. (28), or with $II_2 + Pd$ in alc. soln. (28), or with $II_2 + Pd$ in alc. soln. (28), or with $II_2 + Pd$ in alc. soln. (29), or with $II_2 + Pd$ in alc. soln. (29), or with $II_2 + Pd$ in alc. soln. (29), or with $II_2 + Pd$ in alc. soln. (29), or with $II_2 + Pd$ in alc. soln. (29), or with $II_2 + Pd$ in alc. soln. (29), or with $II_2 + Pd$ in alc. soln. (29), or with $II_2 + Pd$ in alc. soln. (29)

From benzotrichloride. [For formn. of \bar{C} from benzotrichloride (3:6540) by actn. of Ni on htg. in atm. of CO_2 see (23).]

From Miscellaneous Initial Materials

[For form. of \tilde{C} from diphenylace aldehyde [Beil. VII-438, VII₁-(234)] with PCl₅ in C_6H_6 under reflux 2 hrs. (41% yield) see (3)]

CHEMICAL BEHAVIOR OF C

Action of heat. C on repeated htg. above its m.p. is partially isomerized to its diastereo-isomer (3:2570) as a result of which the m.p. of the sample gradually falls to about 160° but not lower (8) (16).

Reduction. C with Zn dust + AcOH gives good yields (24) of trans-1;2-diphenylethylene (stilbene) (1:7250), m.p. 124°.

Hydrolysis. [No study of the direct hydrolysis of C appears to be recorded. — However, C with AgOAc in boilg. AcOH gives an ester which upon hydrolysis gives (60% yield (8) (16)) almost exclusively d_il-hydrobenzoin (isohydrobenzoin), accompanied by a little

hydrobenzoin; with AgOBz, however, much more of the latter results; however, see also below.]

Other reactions. \bar{C} with alc. KOH on warming under reflux (20) or in an autoclave at 180° (2) splits out 2 HCl yielding diphenylacetylene (tolane) [Beil. V-656, V₁-(319), V₂-(568)], m.p. 60°. — \bar{C} with pyridine in s.t. at 200° for 8 hrs. does not (17) split out HCl (dif. from the " β " stereoisomer (3:2570) q.v.)

[\bar{C} with LiI in alc. refluxed 2 hrs. is little affected but in s t at 200° for 3 hrs. gives (11) (presumably via halogen interchange and subsequent loss of l_2) a little trans-1,2-diphenylethylene (stilbene) (1:7250). — \bar{C} with NaI in alc. is unchanged even at 150° in s.t.; using AcOH as solvent, however, in s.t. at 210° stilbene (1:7250) is formed (11). — \bar{C} does not (11) react with alc. NaBr.]

[C with AgOAc (2 moles + 25% excess) in AcOH at 100° for 9 hrs. gives (25) mixts. of hydrobenzoin diacetate, m.p. 133-134°, and isohydrobenzoin diacetate, m.p. 114-116° (for m.p./compn. diagram of this pair see (25) (26)).]

3:4855 5-CHLOROBENZENETRICARBOXYLIC C₉H₅O₆Cl Beil. S.N. 1008 ACID-1,2,4 COOH

(5-Chlorotrimellitic acid)

COOH

M.P. 192-194° (1)

(For prepn. of \tilde{C} from 5-chloro-1,2,4-trimethylbenzene (5-chloropseudocumene) [Beil. V-402] by oxidn. in aq. pyridine with KMnO₄ see (1).]

 $[\bar{\mathbf{C}}$ on suitable treatment with alk. yields (1) 5-hydroxytrimellitic acid [Beil. X-580] for use as dye intermediate.]

3:4855 (1) I.G., Brit. 495,432, Dec. 8, 1938; Cent. 1939, I 1452; C.A. 33, 2913 (1939); French 839,454, April 4, 1939, C.A. 36, 5188 (1942).

3:4857 2,3-DICHLORONAPHTHOQUINONE-1,4 C₁₀H₄O₂Cl₂ Beil. VII - 729 VII₁-(386)

Golden yellow ndls. from AcOH (contg. a little CrO₃ (2)) or from alc. — Sublimes (use in purification (12)). — Insol. aq. (1 in 10,000,000 (13)), spar. sol. cold alc. AcOH, CCl₄, ethyleneglycol ethyl ether, gasoline, cottonseed oil, castor oil, "Nujol" (13); quite sol. (4% (13)) in xylene or o-dichlorobenzene (3:6055); fairly sol. in ether, C₆H₆, acetone, or dioxane (13).

[For use of C as agricultural and textile fungicide see impt. review article (13) cf. (37).] [For prepn. of C from naphthoquinone-1,4 (1:9040) in AcOH with Cl₂ in pres. of I₂ (yields: 90% (14), 80% (8)), from 2-chloronaphthoquinone-1,4 [Beil. VII-729] in AcOH with Cl₂ (15) (16), from naphthoquinone-1,4-N-chloromonimide [Beil. VII-726] in AcOH with 8-10 pts. conc. HCl on warming (70% yield (11)) see indic. refs.; from naphthol-1 (1:1500) with HCl + KClO₃ (6) or after preliminary sulfonation to naphthol-1-sulfoni acid-4 (Neville-Winther acid) followed by HCl + KClO₃ (yields: 83% crude (4), 47% (2), 40-47% (12)) (17) (18), from 4-nitrosonaphthol-1 (naphthoquinone-1,4-monoxime) [Beil. VII-727, VII₁-(386)] in ether with HCl gas (3), from 4-aminonaphthol-1 in AcOH with Cl₂ (17), from 2,3-dichloronaphthol-1 (3:2935) in AcOH with CrO₃ (19), or from 2,4-dinitrophenol (Martius Yellow) [Beil. VI-617, VI₁-(308)] with HCl + KClO₃ (24% yield (2)) (10) see indic. refs.]

[For formn. of \bar{C} from 1,4-dihydroxynaphthalene-3-pyridinium chloride (itself from naphthoquinone-1,4 (1:9040) + pyridine in MeOH + HCl) with SOCl₂ under reflux see (7); from naphthalene (1:7200) in AcOH with CrO₂Cl₂ see (20); from 1,2,3,4-tetrachloronaphthalene [Beil. V-546, V₂-(446)] in AcOH with CrO₃ or with conc. HNO₃ in s.t. at 110° see (9); from naphthalene tetrachloride-1,2,3,4 (3:4750) with conc. HNO₃ see (1): from 2,2,3,4,4-pentachloro-1-oxo-naphthalene tetrahydride [Beil. VII-370] with dil. alc. or dil. AcOH in s.t. at 120-130° see (15).]

[\tilde{C} on reduction by shaking ether soln. with aq. SnCl₂ (21), or with Sn + HCl (part of halogen is lost (10)), or by refluxing with HI + white P (10) gives 2,3-dichloro-1,4-di-hydroxynaphthalene [Beil. VI-979], colorless scales from alc., m.p. 135° (21), 135–140° (10); note that \tilde{C} is reduced by SO₂ + aq. only in s.t. at 130–140° (10). — Note that \tilde{C} with aq. K₂SO₃ or aq. KHSO₃ soln. replaces both chlorine atoms giving (10) K salt of 4-hydroxy-2,3-disulfonaphthyl-1 sulfuric acid [Beil. XI-304].]

 $\ddot{\mathbf{C}}$ on oxidn. with boilg. HNO₃ (D=1.35) slowly yields (10) phthalic acid (1:0820).— $\ddot{\mathbf{C}}$ with aqua regia htd. in s.t. yields (22) phthalic (or nitrophthalic) acid accompanied by some trichloronaphthoquinone-1,4 [Beil. VII-730], yel. ndls., m.p. 250°.

 \bar{C} with equal wt. MnO₂ + 4.8 wts. conc. HCl in s.t. at 230° for 10 hrs. (11) cf. (17) yields 2,2,3,3-tetrachloro-1,4-dioxonaphthalene tetrahydride-1,2,3,4 [Beil. VII-702], colorless pr. from ether, m.p 117° (11).

Č with PCi₅ (2 moles) dislvd. in POCl₃ htd. in s.t. at 180-200° (10), or at 200-250° for 4-5 hrs. (22) (with slow rise of temp. to avoid explosion), yields 1,2,3,4,5-pentachloronaphthalene [Beil. V-546], colorless ndls. from alc., m.p. 168.5° (10) (22).

[Č with large excess MeMgI in ether gives (45% yield (23)) (by replacement of 1 atom of chlorine and usual reactn. of the two carbonyl groups) 1,2,4-trimethyl-1,4-dihydroxy-3-chloro-1,4-dihydronaphthalene, cryst. from ether by pptn. with pet. ether, m.p. 115–117° (23); with certain other RMgX cpds., however, both chlorine atoms are replaced, e.g., Č with large excess C₆H₅MgBr in ether gives (34% yield (23)) 1,2,3,4-tetraphenyl-1,4-dihydroxy-1,4-dihydronaphthalene, cryst. from C₆H₆ + alc., m.p. 241.5° (23); with still other RMgX cpds. neither halogen is affected and only the carbonyl groups react; e.g., Č with large excess α-C₁₀H₇MgBr in ether gives (75% yield (23)) 1,4-di-α-naphthyl-1,4-dihydroxy-2,3-dichloro-1,4-dihydronaphthalene, m.p. 261° dec. (23).]

[C with 2 pts. Cu powder htd. in nitrobenzene or at 240° as directed (24) gives 3% yield triphthaloylbenzene (1,2,3,4-diphthaloylanthraquinone). — C with HBr in nitrobenzene htd. in pres. of CuCl₂ yields (25) 2-bromo-3-chloronaphthoquinone-1,4, m.p. 206-207° (25).]

[C with 2,3-dimethylbutadiene-1,3 (1:8050) in pres. of excess 5% alc. KOH and a little sodium hydrosulfite boiled 2 hrs. and then oxidized with air gives (26) 2,3-dimethylanthraquinone [Beil. VII-815, VII₁-(425)], yel. ndls. from alc., m.p. 205-206°.]

 \bar{C} with bolls alc. KOH hydrolyzes 1 chlorine yielding on acidification (10) 3-chloro-2-hydroxynaphthoquinone-1,4 [Beil. VIII-304], yel. ndls. from alc., m.p. 215°; note that \bar{C} with NaOAe htd. in alc. yields (27) the corresp. acetate, viz., 3-chloro-2-acetoxynaphthoquinone-1,4, yel. ndls. from hot alc, m.p. 98° (27). — [For reactn. of \bar{C} with Na₂S or with H₂S leading to bimolecular condensation with formn. of dibenzothianthrene diquinone or its derivs. see (28) (8).]

 \bar{C} with phenol (2 moles) + dry K_2CO_3 (i.e., K phenolate) htd for 1 hr. at 100° gives (96% yield (2)) 2,3-diphenoxynaphthoquinone-1,4, or.-yel. ndls. from xylene, m.p. 205° (2). — [For reactn. of \bar{C} with pyrocatechol (1:1520) in pres. of diethylaniline (2), with pyrogallol (1:1555) in pres. of pyridine (29), or with various anthrols and pyridine in prepn. of vat dyes (30) see indic. refs.]

 \tilde{C} in nitrobenzene treated with NH₃ gas or \tilde{C} in boilg. alc. treated dropwise with conc. NH₄OH (27) gives (probably by 1,4-addition and subsequent loss of 1 HCl (31)) (80% yield (2)) 3-chloro-2-aminonaphthoquinone-1,4, yel.-br. ndls. from AcOH, m.p. 193° (2) (corresp. acetyl deriv., m.p. 219° (27)). — Similarly, \tilde{C} with aniline (2 moles) in hot alc. gives (87% yield (12)) (32) 3-chloro-2-anilinonaphthoquinone-1,4 [Beil. XIV-168, XIV₁-(434)], copper-red ndls., m.p. 202° (32). — [For corresp. reactn. of \tilde{C} with many other aliphatic or arom. amines see (33), with β -naphthylamine see (34), with p-phenylenediamine (or its monoacetyl deriv.) see (12); with p-chloroaniline see (27); note that some amines, e.g., ρ -nitroaniline, 2-aminoanthraquinone, and 3-chloro-2-aminonaphthoquinone do not undergo this reactn. (27). — For reactn. of \tilde{C} with pyridine see (2).]

 \bar{C} on nitration, e.g., with 4 vol/pts. red fumg. HNO₃ (D=1.52) + $2\frac{1}{2}$ vol./pts. pure conc. H₂SO₄ at 100° for 6 hrs. (35) cf. (36), gives (40-45% yield (35)) 5-nitro-2,3-dichloronaphthoquinone-1,4, pale yel. cryst. from CHCl₃ (35), AcOH (36), or alc. (36), m.p. 175° (35) (36); this prod. with aniline (2 moles) in hot alc. yields (35) 3-chloro-2-anilino-5 (8)-nitronaphthoquinone-1,4, lfts. from nitrobenzene, m.p. 273° (35).

3:4860 3,6-DICHLOROPHTHALIC ANHYDRIDE

B.P. 339° (3)

M.P.	193.5-194.5° cor. (1)		
	191° cor.	(2)	
	190-191°	(3)	
	187°	(4)	
	184-186°	(5)	
	185°	(6) (7)	

[See also 3.6-dichlorophthalic acid (3:4870).]

Long colorless ndls. — Sublimes.

[For prepn. of \bar{C} from 3,6-dichlorophthalic acid (3:4870) by htg. at 130-140° (2) (3) (4), at 160° (8), at 180-190° (5), by distn. under diminished press. (9), or by htg. in a current of dry air at 40° (?) (10) see indic. refs.: from ethyl hydrogen 3,6-dichlorophthalate by htg. at 200-220° see (2) (5): for formn. of \bar{C} (together with other isomers) from phthalic anhydride (1:0725) with Cl_2 in pres. of Fe or Fe salts at 160-260° (11) or with Cl_2 in fumg. H₂SO₄ (12) in pres. of I₂ (3), or from 3-chlorophthalic anhydride (3:3900) with Cl_2 in fumg. H₂SO₄ in pres. of I₂ (3), see indic. refs.]

[For sepn. of \bar{C} from isomeric dichlorophthalic anhydrides by means of salts of corresp. acids, etc., see (3) (13) (1); by means of differential hydrolysis with H_2SO_4 (prods. with no α -chlorine such as 4,5-dichlorophthalic anhydride require H_2SO_4 of 98–100% concn., those with 1 α -chlorine such as 3,4-dichlorophthalic anhydride hydrolyze with 56–95% H_2SO_4 , those with 2 α -chlorine atoms such as \bar{C} or 3,4,5,6-tetrachlorophthalic anhydride hydrolyze at H_2SO_4 concns. of less than 50%) see (14).]

C dislyd. in abs. EtOH yields the acid ester, viz., ethyl hydrogen 3,6-dichlorophthalate.

cryst. from CCl₄, m.p. 130–131° (3), 128–130° (2), 128–129° (5); note that this ester when dislvd. in EtOH and satd. with HCl gas, then warmed, does *not* convert to the neutral ester readily, and that even with 15 pts. EtOH and 7 hr. htg. only 16% diethyl 3,6-dichlorophthalate is formed (2).

[C with 1 mole PCl₅ htd in s.t. at 160° for 6–7 hrs. (8) or at 200° for 6 hrs. (15) yields pseudo-3,6-dichlorophthaloyl dichloride (3,3,4,7-tetrachlorophthalide), cryst. from C₆H₆, m.p. 122° (15); this prod. upon htg. above its m.p., or upon solution in inert solvents, or very rapidly upon treatment of such solns, with decolorizing carbon, or slowly even in solid condition, isomerizes to sym-3,6-dichlorophthaloyl dichloride, colorless pr., m.p. 31° (15), from low-boilg pet. ether (in which the pseudo-chloride is spar sol.). — With MeOH the pseudo chloride yields the pseudo dimethyl ester (4,7-dichloro-3,3-dimethoxyphthalide, m.p. 134° (15); the neutral dimethyl 3,6-dichlorophthalate (corresp. to the sym.-chloride) has m.p. 82° (15).] — [C with 2 moles PCl₅ htd. in s.t. several hrs. at 200° is claimed (8) to yield a prod. C₈H₂OCl₆, ndls. from ale, m.p. 117° (8).]

[C with 1 mole NH₂OH.HCl + Na₂CO₃ in aq. as directed (3) for 3,4-dichlorophthalic anhydride (3:4880) yields 3,6-dichlorophthalylhydroxylamine (N-hydroxy-3,6-dichlorophthalmide) [Beil. XXI-504], ndls from MeOH, m.p. 253-258° (3); the conv. of this prod. with boilg aq. Na₂CO₃ to 3,6-dichloroanthranilic acid (analogous to the corresp. process with its isomers) has not been reported (see, however, under the imide below).]

 $[\bar{C} \text{ with steam passed over cat. at } 380-420^{\circ} \text{ loses CO}_2 \text{ presumably yielding (16) 2,5-dichlorobenzoic acid (3 4340).}]$

 \bar{C} with AlCl₃ + C₆H₆ yields (8) (17) 3,6-dichloro-2-benzoylbenzoic acid [Beil. X-750, X₁-(357)], ndls. from C₆H₆ (17) or dil. alc. (8), m.p. 168.5° (18), cor. (17), 159° (8); this prod. on ring closure by htg. with cone H₂SO₄ (2) (17) (18) (19) yields 1,4-dichloroanthraquinone [Beil. VII₁-(411)], yel. ndls. from AcOH, m.p. 187.5-188° (20), 187.5° cor. (17), 187.5° (18), 186° (19). — [For corresp. reactns. of \bar{C} + AlCl₃ with chlorobenzene (22), with toluene (21), with o-chlorotoluene (3:8245) (23), with p-chlorotoluene (3:8287) (24), with fluorene (25), with acenaphthene (26), with pyrene (27), or with β -methylbenzanthrone (28) see indic. refs.]

[$\bar{\rm C}$ with hydroquinone (1:1590) + H₃BO₃ htd. at 190° and afterward treated with hot conc. H₂SO₄ (29), or htd. with AlCl₃ + NaCl at 200–220° for 20 min. (30), gives (yield: 30% (29), 84% (30)) 5,8-dichloro-1,4-dihydroxyanthraquinone (5,8-dichloroquinizarin) [Beil. VIII₁-(715)], cryst. from xylene (30) or AcOH (29), m.p. 275.5° (30), 266° (29) (diacetate, m.p. 180° (30), 170° (29))] — [For reactn. of $\bar{\rm C}$ with AlCl₃ + o-cresol (31), with o-cresol methyl ether (31) (19), or with p-cresol (7) see indic. refs.; for reactn. of $\bar{\rm C}$ with α -naphthol + H₃BO₃ see (9).]

|\tilde{\mathbb{C}} \text{ in fumg } \text{H}_2\text{SO}_4 \text{ treated with } \text{Br}_2 \text{ yields (33) (34) 3,6-dichloro-4,5-dibromophthalic anhydride, colorless ndls. from AcOH, m.p. 269-270° (34), 261° (33). -- \tilde{\mathbb{C}} \text{ in fumg. } \text{H}_2\text{SO}_4 (50\% SO_3) \text{ htd. with } \text{I}_2 \text{ as directed (32) gives (97\% yield) 3,6-dichloro-4,5-di-iodophthalic anhydride, yel. pr. from AcOH, m.p. 258°-258.5° \text{ cor (32).}

[For condens. of \bar{C} with substituted *m*-aminophenols in prepn. of phthalein dyestuffs see (35); for use of \bar{C} in piepn. of pigments of phthalocyanine type see (36) (37); for use of \bar{C} as plasticizer for cellulose esters see (38).]

Fused Č treated with dry NH₃ gas (39) or with urea (37) yields 3,6-dichlorophthalimide [Beil. XXI-504], ndls. from alc., m.p. 242° (39). [This prod. on ring opening and Hofmann degradation with aq. alk. NaOCl (3) or NaOBr (39) gives 3,6-dichloroanthranilic acid [Beil. XIV-367], ndls. from aq. or AcOH, m.p. 153° cf. (3). — [For behavior of Č with hydrazine hydrate yielding acc to conditions N-amino-3,6-dichlorophthalimide, N-(3,6-dichlorophthalimido)-3,6-dichlorophthalimide, or 3,6-dichlorocyclophthalhydrazide see (40).]

Č (1 pt.) dislvd. in 5 pts. boilg. AcOH and treated with 1 pt. aniline gives on cooling (82% yield (1)) 3,6-dichlorophthalanil [Beil. XXI₁-(391)], pale yel. lfts. or ndls. from AcOH, m.p. 201° (10), 197-198° cor. (1), 194° (41), 191° (39). [Note, however, that on protracted htg. with excess aniline first one and then the other nuclear halogen also reacts yielding, respectively, 3-anilino-6-chlorophthalanil, unstable form, m.p. 141° cor. (1), stable form, m.p. 160-160.5° cor. (1), and 3,6-dianilinophthalanil, m.p. 197° (41).]

C on saponification with standard alk. (Sap. Eq. = 108.5), followed by acidification, yields 3.6-dichlorophthalic acid (3:4870) q.v.

3:4870 3,6-DICHLOROPHTHALIC ACID

M.P. See text.

[See also 3,6-dichlorophthalic anhydride (3:4860).]

Tbls. from aq.; eas. sol. hot aq. in which it readily gives supersatd. solns.; eas. sol. alc., ether.

 $\bar{\mathbf{C}}$ on htg. begins to lose aq. even at 100° with formn. of 3,6-dichlorophthalic anhydride (3:4860) cf. (1); this change proceeds with increasing speed as the temperature increases; for this reason no definite m.p. of $\bar{\mathbf{C}}$ is recorded and the m.p. observed is actually that of the anhydride.

[For prepn. of C from 3,6-dichlorophthalic anhydride by hydrolysis see the anhydride

(3:4860); from ethyl hydrogen 3,6-dichlorophthalate by htg. at 200° to convert to the anhydride and hydrolysis of the latter see (1); from 1,4-dichloronaphthalene (3:1655) by boilg, with HNO₃ (D=1.3) see (2); from 1,4,5-trichloronaphthalene (3:4005) by htg. with HNO₃ in s.t. see (3); from " α -tetrachloronaphthalene" [Beil. V-546] by oxidn, with HNO₃ see (4); from 1,4-dichloronaphthalene tetrachloride (1,2,3,4,5,8-hexachlorotetralin) [Beil. V-493] by boilg, with conc. HNO₃ (D=1.42) see (5) (6); from 5,8-dichloronaphthylamine-2 [Beil. XII-1310] on oxidn, with dil. HNO₃ in s.t. at 180-200° see (7).]

[For sepn. of \bar{C} from mixts. with the isomeric 3,4- (3:4880) and 4,5- (3:4890) dichlorophthalic acids see (8) (9).] [For use of \bar{C} as softener and/or plasticizer for cellulose derive. see (10).]

Salts. NH₄HĀ, NaHĀ, KHĀ, as well as $(NH_4)_2\bar{A}$, Na₂Ā, and K₂Ā, are all eas. sol. aq. (8); Ag₂Ā, insol. aq. (8) (12); CaĀ, 4H₂O (5) (12), spar. sol. aq. and pptd. by CaCl₂ from hot dil. aq. solns. of $(NH_4)_2\bar{A}$ (8) (12); BaĀ, H₂O, spar. sol. aq. (5) (12); ZnĀ, eas. sol. aq. (characteristic dif. from 3,4- and 4,5-dichlorophthalic acids and used in sepn. of \bar{C} (8)).

Esters. Dimethyl 3,6-dichlorophthalate, m.p. 82° (11) (from Ag₂Ā with MeI (11)); methyl hydrogen 3,6-dichlorophthalate, unreported; diethyl 3,6-dichlorophthalate, cryst. from 50% alc., m.p. 60° (12) (13) (from Ag₂Ā on htg. with EtI in s.t. at 100° (12) (13), or in very small yield from ethyl hydrogen 3,6-dichlorophthalate with EtOH (1) (14); ethyl hydrogen 3,6-dichlorophthalate, cryst. from CCl₄, m.p. 130-131° (8), 128-130° (1), 128-129° (15) (from 3,6-dichlorophthalic anhydride (3:4860) with EtOH).

[For studies of ionization consts. of first (16) and second (16) (17) acid groups see indic. refs.]

M.P. 194-195° (1) 194° (2) 193-194° (3)

[See also tetrachlorobenzoquinone-1,2 (3:3965).]

Colorless anhydrous cryst. from hot dil. alc. (1), lgr. (1) or C_6H_6 (2); \bar{C} from dil. AcOH seps. as monohydrate which over CaCl₂ loses half of its water and above 70–80° all of its aq. (3) (4); \bar{C} from AcOH seps. as a cpd., \bar{C} .AcOH, m.p. 123–124° (4), which can be recrystd. unchanged from lgr. but in air or more rapidly over alk. loses its cryst. AcOH; the above cpd. on soln. in alc. and pptn. with much aq. yields a trihydrate, \bar{C} .3H₂O, m.p. 94°, which can be recrystd. unchanged from aq., alc., or acetone but which from C_6H_6 or lgr. seps. \bar{C} in anhydrous form (4).

[For prepn. of C from pyrocatechol (1:1520) with Cl₂ in AcOH (5) (2) (13) or with ICl

(3) see indic. refs.; from hexachlorocyclohexene-3-dione-1,2 [Beil. VII-575] by reductn. with SnCl₂ in AcOH see (1).]

 $\bar{\mathbf{C}}$ with std. alk. (using phenolphthalein) titrates sharply as a monohydric phenol (4) (6), i.e., Neut. Eq. 248; similarly titration of the cpd. $\bar{\mathbf{C}}$.AcOH (above) gives Neut. Eq. 154 (4).

 $\bar{\mathbf{C}}$ on oxidn. with fumg. HNO₃ in AcOH gives (81% yield (13)) (1) (5) (7) (8) tetrachloro-o-benzoquinone-1,2 (3:3965). — For study of oxidn.-reductn. potential of system: $\bar{\mathbf{C}}$ + tetrachlorobenzoquinone-1,2 see (7) (8). — $\bar{\mathbf{C}}$ with equiv. tetrachlorobenzoquinone-1,2 (3:3965) in least possible hot CHCl₃ gives on cooling the corresp. quinhydrone (14). — [For other complex prods. obtd. from $\bar{\mathbf{C}}$ by action of conc. HNO₃ or N₂O₄ (9), HNO₃ + H₂SO₄ (10), or NaNO₂ in AcOH (2) see indic. refs.]

- **D** Tetrachloropyrocatechol diacetate: ndls. from AcOH, m.p. 190° (1). [From \bar{C} with Ac₂O (1).]
- Tetrachloropyrocatechol monomethyl ether (tetrachloroguaiacol) [Beil. VI-784]: ndls. from hot aq., m.p. 185-186° (11). [Reported only by indirect means (11).]
- Tetrachloropyrocatechol dimethyl ether (tetrachloroveratrole) [Beil. VI-784]: ndls. from alc., m.p. 88° (11) (12). [Reported only by indirect means (11) (12).]

3:4880 3,4-DICHLOROPHTHALIC ACID CLCOOH C8H4O4Cl2 Beil. IX-817 IX₁—

M.P. abt. 195° rap. htg. (1)

[See also 3,4-dichlorophthalic anhydride (3:3695).]

Rectangular tbls. from aq.; eas. sol. aq., ether. — \bar{C} can only with difficulty be separated from 4,5-dichlorophthalic acid (3:4890) by crystn. (1).

[For prepn. from 3,4-dichlorophthalic anhydride (3:3695) on boilg, with aq. see (1); from N-(hydroxy)-3,4-dichlorophthalimide (see under 3,4-dichlorophthalic anhydride) by hydrolysis with hot 10% HCl see (1)]

[For sepn. of \bar{C} from mixts, with the isomeric 3,6- (3:4870) and 4,5- (3:4890) dichlorophthalic acids see (1) (2).]

Salts. NaHĀ, Ag₂Ā, CuĀ, CaĀ, BaĀ, ZnĀ all spar. sol. aq. (1).

Esters. Methyl hydrogen 3,4-dichlorophthalate and dimethyl 3,4-dichlorophthalate are both unreported: both possible ethyl hydrogen 3,4-dichlorophthalates are known, viz., ethyl 2-carboxy-3,4-dichlorophthalate (from \bar{C} + abs. EtOH + few drops conc. H₂SO₄ refluxed 6 hrs. (3)), ndls. from dil. alc., m.p. 184° (3); and 3,4-dichloro-2-carbethoxybenzoic acid (from diethyl 3,4-dichlorophthalate by partial KOH saponification or from the anhydride with abs. EtOH (3)), pr. from dil. alc., m.p. 164° (3): diethyl 3,4-dichlorophthalate (from Ag₂Ā), m.p. 80° (3). [For the pseudo diethyl ester of \bar{C} see under 3,4-dichlorophthalic anhydride (3:3695).]

 $\bar{\rm C}$ on protracted htg. at 220° loses aq. yielding 3,4-dichlorophthalic anhydride (3:3695) q.v.

3:4880 (1) Villiger, Ber. 42, 3538-3539, 3541-3542 (1909). (2) Hodgson, J. Soc. Dyers Colourists 49, 215 (1933). (3) Kirpal, Galuschka, Lassak, Ber. 68, 1333-1334 (1935).

3:4885 1-CHLORONAPHTHOIC ACID-2

M.P. 196° (1) (2) 195° (3)

Ndls. from C₆H₆ (1) (2) or from 50% AcOH (3). — Volatile without decompn. (1).

[For prepn of C from 2-(1-chloronaphthyl)carbinol (2) by oxidn see (2); from 1-chloro-2-(trichloromethyl)naphthalene [Beil. V-568] by hydrolysis in boilg. AcOH contg. a little aq. see (1); from 1-chloro-2-naphthonitrile (see below) by hydrolysis with AcOH/H₂SO₄/aq. mixt. see (4); from methyl 1-chloro-2-naphthoate (see below) by hydrolysis with boilg. 15% alc. KOH (46% yield) see (3).]

 \bar{C} with 2% Na/Hg in eq. reduces (1) to β -naphthoic acid (1:0800), m.p. 184° (1).

[The direct conv. of \bar{C} to 1-chloro-2-naphthoyl chloride is not actually reported; however, this acid chloride, m p. 59-60 5° (6), b.p. 226° at 150 mm. (6), b.p. 199-200° at 11.2 mm. (5), has been obtained (5) (3) (6) from 1-hydroxy-2-naphthoic acid [Beil. X-331, X_1 -(145)] with PCl₅ (yield 60 7% (5)) (2).]

Salts. AgA, white flocks spar. sol. aq.; CaA2.2H2O, cryst from aq. (1).

- Methyl 1-chloro-2-naphthoate: ndls. from alc., m.p. 50° (2), cryst. from pet. eth. + acetone, m.p. 44-48° (5); b p. 189-193° at 17.5 mm. (3), 186.5-189° (but press. not given) (5). [From C in MeOH with HCl gas (2) or from the acid chloride (above) in boilg. MeOH (5) (3)] [This ester with Cu bronze + a trace of I₂ at 290° yields (5) dimethyl 1,1'-binaphthyl-2,2-dicarboxylate.]
- --- Ethyl 1-chloro-2-naphthoate: unreported.

3:4892 PENTACHLOROBENZALDEHYDE
$$C_7HOCl_5$$
 Beil. VII — VII₁-(134)

M.P. 202.5° (1) (2) 197-199° (3)

Colorless ndls. from C₆H₆/alc.; eas. sol. hot C₆H₆ or CS₂; spar. sol. alc., ether, lgr.

[For prepn. of \bar{C} from pentachlorobenzal (di)chloride (3:3590) by hydrolysis with conc. H_2SO_4 at 60–100° or fumg. H_2SO_4 at 40–50° (90% yield (2)) (3) see indic. refs.; from pentachlorobenzaldehyde diethylacetal (see below) by acid hydrolysis see (1).]

Č with aq. alk. KMnO₄ refluxed 7 hrs. oxidizes to (90% yield (1)) pentachlorobenzoic acid (3:4910).

Č in C₆H₆ shaken with satd. aq. NaHSO₃ soln. gives (1) the corresp. NaHSO₃ cpd.

Č with aq. 50% KOH at 100° for 5 hrs. suffers hydrolytic cleavage giving (88% yield (2)) pentachlorobenzene (3:2290) and potassium formate.

Č with EtOH + dry HCl gas gives (60% yield (1)) pentachlorobenzaldehyde diethylacetal, colorless cryst. from pet. ether, m.p. 45°.

[For use of C on prepn. of dyes of the triphenylmethane series see (4).]

Č reacts normally with RMgX reagents [e.g., Č with McMgBr gives (49% yield (1)) methyl-pentachlorophenyl-carbinol, colorless cryst. from alc., m.p. 126° (1); Č with C₆H₅-MgBr gives (1) phenyl-pentachlorophenyl-carbinol (pentachlorobenzohydrol), cryst. from C₆H₆, m.p. 117°.]

Č with anhydrous NaOAc + Ac₂O (Perkin synthesis) at 170-180° for 60 hrs. gives (30% yield (1)) 2,3,4,5,6-pentachlorocinnamic acid, cryst. from C₆H₆, m.p. 233° cor. (1).

Č with aniline at 100° condenses giving (1) pentachlorobenzaldehyde anil, greenish ndls. from C₆H₆/alc., m.p. 187.5° cor. (1).

- D Pentachlorobenzaldoxime: colorless ndls. from C₆H₆, m.p. 201° cor. (1). [From C with NH₂OH.HCl + Na₂CO₃ in dil. alc. on stdg. few days (1).]
- Pentachlorobenzaldehyde phenylhydrazone: citron-yel. ndls. from alc., m.p. 152.5° cor. (1). [From \(\tilde{C}\) in hot satd. C₆H₆ soln. with 1 mole phenylhydrazine (1).]
- —— Pentachlorobenzaldehyde p-nitrophenylhydrazone: unreported.
- ---- Pentachlorobenzaldehyde 2,4-dinitrophenylhydrazone: unreported.
- ---- Pentachlorobenzaldehyde semicarbazone: unreported,

3:4893 OCTACHLORONAPHTHALENE

(Perchloronaphthalene)

M.P. B.P. 440-442° at 754 mm., dec. (2) 202° u.c. (7) 258-260° at 2.5 mm. (2) 200° (6) 246-250° at 0.5 mm. (2) 197.5-198° cor. (2) 197.3-198° cor. (3)

Ndls. from $CCl_4 + C_6H_6$ (2); fairly eas. sol. C_6H_6 , lgr., CHCl₃; spar. sol. alc. or AcOH. [For prepn. of \bar{C} from naphthalene (1:7200) with Cl_2 in pres. of 1% Fe powder + 0.1% I_2 first at 100° then at 150° for 10-12 hrs. (90% yield (2)) or with Cl_2 in pres. of SbCl₅ (1) (4) cf. (2) see indic. refs. (for extensive study of merits of many catalysts see (5)).]

[For prepn. of \bar{C} from mixt. of 2-hydroxynaphthalene-1,5-bis-(sulfonyl chloride) and 2-hydroxynaphthalene-1,6-bis-(sulfonyl chloride) (from β -naphthol with ClSO₃H) with PCl₅ in s.t. see (6); from 1-hydroxynaphthalene-tris-(sulfonyl chloride) with PCl₅ in s.t. at 250° see (7); from 1-amino-3,6,8-tris-(sulfonyl chloride) with 3-4 pts. PCl₅ in s.t. at 200-225° for 7 hrs. (40% yield) see (2).]

[For prepn. of \bar{C} from 2,5,6,7,8-pentachloronaphthoquinone-1,4 [Beil. VII-731] with PCl₅ in s.t. at 250° for 6 hrs. see (8); from hexachloronaphthoquinone-1,4 (see below) with PCl₅ see (3).]

[For study of action of \bar{C} (from insulation material on electric wiring) in production of acne see (9); for prepn. of aq. dispersions of \bar{C} see (10); for use of \bar{C} as insecticide see (11); for use of \bar{C} in prepn. of a red mordant dyestuff (by actn. of fumg. H_2SO_4) see (12).]

[\tilde{C} with H_2 passed through a red-hot tube (4) or \tilde{C} with Na + EtOH (2) gives naphthalene (1:7200) together with other prods.]

 \overline{C} on oxidn. with 10 pts. fumg. HNO₃ (D=1.52) in s.t. at 90° gives in good yield (2) (3) hexachloronaphthoquinone-1,4, m.p. 222.5° cor., b.p. 412-415° at 758 mm. dec., 265-267° at 14 mm., accompanied by some tetrachlorophthalic acid (3:4946).

[C̄ on htg. with SbCl₅ + ICl in s.t. at 350° (1) breaks down yielding (2) cf. (1) carbon tetrachloride (3:5100), hexachloroethane (3:4835), hexachlorobenzene (3:4939), and other prods.; under certain conditions (not specified in abstracts) C̄ can be broken down to decachloroindane (perchlorohydrindene) [Beil. V-487], m.p. 138° cor. (2).

 $[\bar{C}]$ with pyridine + CuO + hydrazine hydrate yields (13) a hexachloronaphthalene ndls. from chlorobenzene, m.p. 202-204° (13) (note that m.p. is close to that of \bar{C}).]

Č is stable toward 3% aq. KOH or NaOH for 12 hrs. in cold or even 2 hrs. boilg.; Č is stable to cold 3% alc. KOH or NaOH for 24 hrs., but on htg. for 2 hrs. splits off some 25-30% chlorine and in part resimfies (2).

© Color test with SbCl₅ in CCl₄; \bar{C} with SbCl₅ in CCl₄ gives stable cherry-red color (2). [This response is not given by carbon tetrachloride (3:5100), hexachlorocthane (3:4835), hexachlorobenzene (3.4939), or decachloroindane (2).]

3:4895 PENTACHLORÓPROPIONIC ACID Cl
$$C_3HO_2Cl_5$$
 Beil. II — II_1 -(112) II_2 -(228)

M.P. 200-215° (see text (1)).

Colorless cryst. from CCl₄. — Eas sol cold aq.

[For prepn. of \tilde{C} from truchloroacrylic acid (3:1840) with Cl_2 in CCl_4 soln. in sunlight (yield not reported) see (1).]

 \bar{C} in aq. soln. behaves as a strong acid; on titration it gives a good Neut. Eq., calcd. 246.5; found 245.8 (1).

 $\bar{\mathbf{C}}$ is very unstable: e.g., $\bar{\mathbf{C}}$ in aq. soln. on warming dec. (1) (with loss of HCl and CO_2) into tetrachloroethylene (3:5460); presumably this same decomposition, occurs on process of taking its m.p., and the value given above refers to rapid htg on Hg bath.

Salts. The salts of \bar{C} can be obtd. by neutralization with metal hydroxide of a cold satd. aq. soln of \bar{C} followed by evaph. to dryness at low temp.; aq. solns. of the salts are also unstable and rapidly decompose yielding metal chloride $+ CO_2 +$ tetrachlorocthylene (3:5460) (1). [For studies of influence of light on decompn. of these salts see (2) (3) cf. (4).]

[For study of behavior of \bar{C} with H_2 + colloidal Pd see (5).]

Acid chloride. Pentachloropropionyl chloride (3:0470) has been obtd. indirectly, i.e., from trichlorogeryloyl chloride with Cl₂ in sunlight (6); colorless cryst., m.p. 42°.

3:4895 (1) Böeseken, Rec. trav. chim 46, 841-843 (1927). (2) Jaeger, J. Chem. Soc. 119, 2070-2076 (1921). (3) Jaeger, Berger, Rec. trav. chim 41, 72 (1921). 200°

199.5°

199-200° u.c.

Colorless ndls. from aq.; spar. sol. aq., eas. sol. alc., C₆H₆, CHCl₃. — Volatile with steam; sublimes with slight decomposition.

[For prepn. of $\bar{\mathbb{C}}$ from *m*-chlorophenol (3:0255) by treatment of dry sodium salt with CO₂ at 140–150° under press. see (3); from 4-chloro-2-aminobenzoic acid (4-chloroanthranilic acid) [Beil. XIV-365, XIV₁-(548)] via diazotzation and boilg. with aq. see (3) (5); from 7-chloro-2,3-dimethylchromone [Beil. XVII₁-(177)] on boilg. with 4% aq. NaOH see (2); for formn. of $\bar{\mathbb{C}}$ from *p*-chlorobenzoic acid (3:4940) by electrolytic oxidn. in acid soln. see (4); from 4-chloro-2-methoxybenzoic acid (see below) by cleavage with HI see (1).

C in aq. soln. gives with FeCl₃ a purple color.

(3)

(4)

(5)

[The methyl ether of Č, viz., 4-chloro-2-methoxybenzoic acid, cryst. from aq., m.p. 148° (1), has been obtd. from 4-chloro-2-methoxybenzaldehyde (1) by oxidn. with aq. alk. KMnO₄ (1).]

3:4908 (1) Hodgson, Jenkinson, J. Chem. Soc. 1927, 1741-1742. (2) Simonis, Schuhmann, Ber. 50, 1146-1147 (1917). (3) Varnholt, J. prakt. Chem. (2) 36, 27-31 (1887). (4) Fichter, Adler, Helv. Chim. Acta 9, 283 (1926). (5) Cohn, Mitt. Technol. Gewerb.-Mus. Wien, 11, 178-182; Cent. 1901, I 925.

Ndls. or pr.; sublimes in vac. with slight decomposition (6). Very sol. toluene or alc. (5). — Best recrystd. from toluene + lt. pet. ether (5). — Can be recrystd. from C_0H_6 or dil. AcOH (6). — From alc. \tilde{C} (despite its high m.p.) first separates as an oil (5).

[For prepn. of \tilde{C} from pentachlorotoluene (3:4937) with conc. HNO₃ + Hg see (5); from pentachlorobenzaldehyde (3:4892) with KMnO₄ (90% yield) see (1); from asymtetrachlorophthalyl chloride + Cl₂ via conversion to and subsequent hydrolysis of pentachlorobenzoyl chloride (3:2295) see (3); from 2,3- (3:4650) or 3,4-dichlorobenzoic acid (3:4925) + MnO₂ + fumg. HCl at 180-200° see (4).]

Pentachlorobenzoyl chloride (3:2295), colorless lfts. from alc., m.p. 87° (3), has been prepd. indirectly (see above), but the reaction (if any) of either PCl_5 or $SOCl_2$ on \bar{C} has never been reported. Upon hydrolysis with alc. KOH the acid chloride yields \bar{C} (3).

- Methyl pentachlorobenzoate: pr. from MeOH, m.p. 97° (3). [Prepared from pentachlorobenzoyl chloride + MeOH by 30 hrs. reflux. (3).]
- Ethyl pentachlorobenzoate: unrecorded.
- Pentachlorobenzamide: unrecorded.
 Pentachlorobenzanilide: unrecorded.

3:4910 (1) Lock, Ber. 72, 303 (1939). (2) Steiner, Monatch. 36, 827 (1915). (3) Kirpal, Kunze, Ber. 62, 2105 (1929). (4) Claus, Bücher, Ber. 20, 1627 (1887). (5) Silberrad, J. Chem. Soc. 127, 2684 (1925). (6) Eckert, Steiner, Monatch. 36, 187 (1915).

3:4915 4-CHLORO-3-METHYLBENZOIC ACID C₈H₇O₂Cl Beil. IX - 478 IX₁— CH₈

Colorless ndls. from hot aq.; alm. insol. cold aq.; very spar. sol. even in hot aq.

[For prepn. of \bar{C} from 4-chloro-1,3-dimethylbenzene (3:8665) by oxidn. with $K_2Cr_2O_7$ + dil. H_2SO_4 see (8) (1); from 4-chloro-1-ethyl-3-methylbenzene (6) by oxidn. with dil. HNO₃ (1:10) at 100° for 10 hrs. see (6); from 4-chloro-3-methylacetophenone [Beil. VII-307] by oxidn. with alk. KMnO₄ see (4); from 4-chloro-3-methyl- ω , ω , ω -trichloroacetophenone (3) see (3); from β -chloroethyl 4-chloro-3-methylphenyl ketone (5) by oxidn. with mixt. of equal pts. conc. HNO₃ and aq. at 100° see (5); from 1,2-bis-(4-chloro-3-methyl-benzoyl)-1,2-dibromoethane (2) by fusion with NaOH see (2); from 4-amino-3-methyl-benzoic acid [Beil. XIV-480] via diazotization and use of Cu_2Cl_2 reactn. see (7).

 \tilde{C} on fusion with KOH yields (1) 4-hydroxy-3-methylbenzoic acid [Beil. X-225, X_1 -(97)], m.p. 173° (1), together with some 4-hydroxyisophthalic acid [Beil. X-502, X_1 -(256)].

Salts. $Ca\bar{A}_2.3H_2O$ (8); $Ba\bar{A}_2.3H_2O$ (8); both eas. sol. aq.

Č on further oxidn. with KMnO₄ yields (4) 4-chlorobenzenedicarboxylic acid-1,3 (4-chloroisophthalic acid) (3:4980).

— Ethyl 4-chloro-3-methylbenzoate: oil, b.p. $260-265^{\circ}$ (8). [From \bar{C} in alc. with HCl gas (8).]

3:4916 9,10-DICHLOROANTHRACENE

(meso-Dichloroanthracene)

$$\begin{array}{c|c} Cl & & C_{14}H_8Cl_2 & \text{Beil. V - } \mathbf{664} \\ & & V_{1^-}(\mathbf{324}) \\ & & V_{2^-}(\mathbf{575}) \end{array}$$

M.P. 210° (1)
209-210° (2) (3)
209° (4) (5) (6) (7)
(8) (9) (10) (23)
208-209° (11) (12)

Yellow ndls. from CCl₄ or C_6H_6 or by sublimation; spar. sol. alc. or ether, eas. sol. C_6H_6 . [For prepn. of \bar{C} from anthracene (1:7285) with Cl₂ in o-dichlorobenzene (5) (30) polychlorobenzenes of b.p. 140–170° (4), nitrobenzene (4) (5), or in acetylene tetrachloride (5) (yields: 93–94% (4), 87–88% (5)) see indic. refs. (note that numerous attempts to use this reactn. are given in earlier literature (3) (13) (14) (15) (16) (17) (18) (19) (20) but none is well adapted for pure \bar{C} owing to simultaneous formin. of more highly chlorinated cpds.); from anthracene with SO_2Cl_2 in CCl₄ (7) (11) or in xylene (11) at ord. temp. (yields alm. quant. (7) (11)) see indic. refs. (note, however, that the results are sometimes influenced by the source of anthracene used (11)); for formin. of \bar{C} from anthracene (1:7285) with Cl₂-aq. (21), with S_2Cl_2 (10), or with NOCl in s.t. at 150° or at room temp. in sunlight (22) see indic. refs.; for formin. of \bar{C} from anthracene present in crude phenanthrene during treatment of latter in CS_2 with Cl_2 see (12).]

[For prepn. of \bar{C} from anthrone (9-hydroxyanthracene) [Beil VII-473, VII₁-(256)] with 2 wt. pts. PCl₅ in C₆H₆ or without solv. at 100° for 16 hrs. see (2); for formn. of \bar{C} from 9,9,10,10-tetrachloro-9,10-dihydroanthracene (9,10-dichloroanthracene dichloride-9,10) [Beil. V-641, V₁-(309)] by actn. of Zn dust, Cu powder, or phenylhydrazine (3) or on boilg, with anthrone (above) in xylene (6) see indic. refs.; for formn. of \bar{C} from 1,2,3,4-tetrachloro-9,10-dichloroanthracene by htg. with hydrazine hydrate + Cu powder in pyridine (23), or from 9-benzylanthracene with SOCl₂ in CHCl₃ (24), see indic. refs.; from α -[9,10-dichloroanthracene tetrabromide-1,2,3,4] (see below) by treatment with Zn dust in AcOH or with Cu powder in C₆H₆ see (3).]

[$\bar{\mathbf{C}}$ with Cl₂ in cold CHCl₃ or acetylene tetrachloride gives (17) 9,9,10,10-tetrachloro-9,10-dihydroanthracene (see above); $\bar{\mathbf{C}}$ with Cl₂ in C_6H_6 at 60° yields (17) 2,3,9,10-tetrachloro-2,3-dihydroanthracene; $\bar{\mathbf{C}}$ in warm CHCl₃ or cold C_6H_6 gives (17) a mixt. of these prods.: the end prod. of chlorination of $\bar{\mathbf{C}}$ in C_6H_6 at 20° appears (16) (3) to be 1,2,3,4,9,10-hexachloro-1,2,3,4-tetrahydroanthracene [Beil. V-611, V₁-(287)], m.p. 205-207° (3). — $\bar{\mathbf{C}}$ with SO₂Cl₂ in nitrobenzene at 100° yields (25) 2,9,10-trichloroanthracene.]

C adds 2 moles Br₂ giving according to conditions one or the other of two isomeric addn. compds.; i.e., \bar{C} moistened with CHCl₃ and treated with 2 Br₂ yields (3) (8) α -[9,10-dichloroanthracene-1,2,3,4-tetrabromide], colorless hexag. pr. from C₆H₆, m.p. 141-142° (3), while \bar{C} with Br₂ vapor gives (3) β -[9,10-dichloroanthracene-1,2,3,4-tetrabromide], ndls. from C₆H₃ (less sol. than α -isomer), m.p. 178-179° (3), 178° (16) (8), 166° (15); both α - and β -isomers with alc. KOH lose 2 HBr (the α - more rapidly than the β -) yielding (3) (8) 2,3-dibromo-9,10-dichloroanthracene, yel. ndls., m.p. 255-256° (3), 251-252° (15) (16) (8).

[\bar{C} in CHCl₃ treated with NO₂ gas gives (26) 9,10-dichloro-9,10-dinitro-9,10-dihydro-anthracene (very unstable white cryst. on strong cooling) which in boilg. CHCl₃ yields anthraquinone (1:9095). — \bar{C} with conc. HNO₃ (D=1.43) in AcOH at 15–18° yields (27) 9,10-dichloro-9-hydroxy-10-nitro-9,10-dihydroanthracene [Beil. VII₁-(258)].]

[\bar{C} with fumg. H₂SO₄ (20% SO₃) in nitrobenzene at 12-15° (4) (5) cf. (28) (30) or in benzenesulfonyl chloride below 50° (28), or \bar{C} with ClSO₃H in CHCl₃ or H₂SO₄ at 30° (29),

yields 9,10-dichloroanthracenesulfonic acid-2 [Beil. XI₁-(44)], cryst. with 2½ H₂O from alc., m.p. 158-159° (4), losing aq. in vac. at 140° to anhydrous acid, m.p. 212° cor. dec. (4) (corresp. sulfonyl chloride, m.p. 221-225° dec., corresp. sulfonamide, m.p. 279°, corresp. sulfonanilide, m.p. 247.8° cor. (4)).]—[For disulfonation of \bar{C} see (33).]

 \bar{C} is unaffected (13) by boilg, alc. KOH. — [For behavior of \bar{C} with pyridine see (31). — For reactn. of \bar{C} with NaSH in alc. yielding anthranol, anthrone, dianthrone, and other prods. see (32). — For use of \bar{C} in prepn. of sulfur dyes see (34).]

C on oxidation yields (18) anthraquinone (1:9095).

 $\bar{\mathbf{C}}$ like many other anthracene derivs. adds to suitable unsatd. linkages (35) (36) (37) in Diels-Alder fashion: e.g., $\bar{\mathbf{C}}$ with maleic anhydride (1:0625) in nitrobenzene, boiled for 15 mm., gives on cooling (50% yield (35)) adduct, colorless pr. from xylene, m.p. 258-259°, from chlorobenzene, m.p. 253° (36), in this adduct the halogen is stable toward boilg. ale. KOH (38) (39), but the adduct with AlCl₃ in C_6H_6 refluxed 10 min. yields (35) 9,10-diphenylanthracene [Beil. V-747, V₁-(377)], cryst. from toluene, m.p. 248° (35). — $\bar{\mathbf{C}}$ with β -chloropropionic acid (3:0460) (used as source of acrylic acid (1:1020) by loss of HCl) boiled for 8 hrs. in σ -dichlorobenzene yields an adduct, cryst. from anisole, m.p. 245° (38); the halogen of this adduct is stable toward hydrolysis and is not removed by boilg. with 10% ale. KOH for 40 min. (38). — $\bar{\mathbf{C}}$ does not (38) form an adduct with cinnamic acid.

Pale yel. ndls. from C₆H₆, chlorobenzene, or toluene; eas. sol. boilg. C₆H₆, toluene, or AcOH; spar. sol. boilg. alc. — Sublimes in vac.

[For f.p./compn. data and diagram of system $\tilde{C}+1$ -chloroanthraquinone (3:4480) (eutectic, m.p. 143.9-144.2°, contg. about 75% \tilde{C}) see (5).]

[For use of \tilde{C} in coloring oils, fats, and waxes see (19); \tilde{C} is widely used as intermediate in prepn. of many dyestuffs, but no general summary can be given here although selected examples occur in the following text.]

[For prepn. of \bar{C} from anthraquinonesulfonic acid-2 [Beil. XI-337, XI₁-(83)] or its Na salt with 25% HCl + NaClO₃ at 100° (11) (20) (for use of this method in detn. of mixt. of anthraquinone- α - and β -sulfonic acids or their salts by f.p./compn. curve of resultant mixt. of 1-chloroanthraquinone (3:4480) + \bar{C} see (5)) see indic. refs.; from sodium anthraquinone-2-sulfonate in dil. HCl on exposure to light see (9), from anthraquinonesulfonic acid-2 on boilg. with dil. H₂SO₄ + NaCl + NaClO₃ see (21); from anthracenesulfonic

acid-2 [Beil. XI-194, XI₁-(44)] with HCl + NaClO₃ at 100° see (22); from anthraquinone-sulfonic acid-2 or its Na salt (23) or from anthraquinone-sulfonyl chloride-2 (24) with SOCl₂ in s.t. at 200-230° see indic. refs.]

[For prepn. of \tilde{C} from o-(4-chlorobenzoyl)benzoic acid [Beil. X-750, X_1 -(356)] by ring closure with conc. H_2SO_4 at 160- 170° (25) (16) (26) (27) (28) (4) (29) (34) (49) in pres. of AlCl₃ (30) see indic. refs. (for study of influence of conditions see espec. (27) (4) (31)); from o-(3-chlorobenzoyl)benzoic acid (32) or from 2-benzoyl-4-chlorobenzoic acid [Beil. X-750, X_1 -(356)] (33) by similar ring closure with H_2SO_4 see indic. refs.; from 4-chloro-2-benzoyl-benzoyl chloride on htg. see (33).]

[For prepn. of $\bar{\rm C}$ from 2-chlorobutadiene-1,3 (chloroprene) (3:7080) + naphthoquinone-1,4 (1:9040) in ${\rm C_6H_6}$ see (6); from α -chlorocrotonaldehyde (3:8117) + naphthoquinone-1,4 (1:9040) in ${\rm C_6H_6}$ with piperidine see (74); from 2-aminoanthraquinone (see below) via diazotization and rapid htg. of diazonium chloride at 150° see (8); from 2-chloroanthraquinonecarboxylic acid-4 by htg. at 286-290° (7) or from 2-chloroanthraquinonecarboxylic acid-5 by htg. in s.t. at 310-320° or by distn. of its Ba salt with BaO see (17) of (15); from 2,9,10-trichloro-9-hydroxy-10-nitro-9,10-dihydroanthracene [Beil. VII₁-(258)] in ${\rm C_6H_6}$, nitrobenzene, or AcOH by htg. at 90-95° see (35); from 2,9,10-trichloroanthracene [Beil. V₁-(325)] (36) or from 2-chloroanthrone-9 (or 10) (12) by oxidn. with CrO₃ see indic. refs.] [For prepn. of $\bar{\rm C}$ from 1-chloroanthraquinone (3:4480) by htg. with conc. H₂SO₄ at 200-205° for 9 hrs. see (37).]

[$\bar{\rm C}$ on reductn. with Zn dust + conc. aq. NH₄OH under reflux yields (18) (37) 2-chloroanthracene [Beil. V₁-(324)], m.p. 217° (37), 215° (18). — $\bar{\rm C}$ on reductn. with hydrazine hydrate in MeOH/KOH at 10 atm. and 135° for 1½ hrs. in pres. of Pd/CaCO₃ cat. yields (38) bis-(2,2'-anthraquinonyl) [Beil. VII₁-(495)], m.p. 387-388°. — $\bar{\rm C}$ on reductn. with Al powder + conc. H₂SO₄ (40) or with Sn + HCl (39) yields a mixt. of 3-chloroanthrone-9, m.p. 156° (38) (corresp. acetate, m.p. 146° (41) (42)), and 2-chloroanthrone-9, m.p. 155° (41) (corresp. acetate, m.p. 143° (41)); this mixt. of chloroanthrones can be septh by acetylation with Λ c₂O + pyridine and fractional crystn. of the resultant acetates (42). — For use of this reductn. method in prepn. of vat dyes see (43). — For study of oxidn./ reductn. potential of $\bar{\rm C}$ see (13).]

[\bar{C} with MeOH/KOH in s.t. at 130° yields (44) 2-methoxyanthraquinone [Beil. VIII-343, VIII₁-(658)], m.p. 196°. — \bar{C} with 2-hydroxyanthraquinone + NaOAc + Cu powder htd. at 250–260° for 12 hrs. gives (66% yield (45)) di-(2-anthraquinonyl) ether, pale yel. ndls. from pyridine, m.p. 324° (45). — \bar{C} with K xanthate + Cu powder boiled for 16 hrs. in AmOH gives (56% yield (45) (46) di-(2-anthraquinonyl) sulfide, cryst. from xylene, m.p. 290.5–291° (45). — \bar{C} with thiosalicylic acid (2-mercaptobenzoic acid) + solid KOH htd. in AmOH at 150° for 8 hrs. gives (77% yield (3)) S-(2-anthraquinonyl)thiosalicylic acid [Beil. X₁-(56)], m.p. 278° cor. (3); this prod. on htg. with H₂SO₄ or better with p-toluenesulfonyl chloride at 200° (3) (47) ring-closes by loss of H₂O to 1,2-phthalylthioxanthone [Beil. XVII₁-(291)], yel. ndls. from AcOH, m.p. 278° cor. (3).]

[Č with NaOH + glycerol htd. at 190° is claimed (48) to yield anthraquinone (1:9095).

— Č with NaOH + NaClO₃ htd. 28 hrs. at 195° (49) cf. (50) (51) (52) gives (95% yield (49)) 1,2-dihydroxyanthraquinone (alizarin) (1:9105). — Č with NaSH boiled in aq. alc. yields (53) 2-mercaptoanthraquinone [Beil. VIII-346, VIII₁-(659)], yel. ndls. from AcOH, m.p. 206° (54). — Č with Na₂Se boiled in dil. alc. yields (55) 2-selenomercaptoanthraquinone, but Č with Se + NaOAc htd. at 205–210° in a mixt. of trichlorobenzene + tetralin for 8 hrs. yields (56) di-(2-anthraquinonyl) selenide.]

[Č with conc. aq. NH₄OH in pres. of Cu salts under press. and at elevated temp. (180–200°) gives (yields: 97.5% (57), 98.6% (2)) (27) (58) (59) (60) 2-aminoanthraquinone [Beil. XIV-191, XIV₁-(449)], red ndls., m.p. 302° (for study of influence of conditions see

(57) (2) (27) (61) (62)). — \bar{C} with hydrazine hydrate + pyridine in s.t. at 170° for 8 hrs. gives (20% yield (63)) 2-hydrazinoanthraquinone [Beil. XV₁-(200)], or.-yel. ndls. from pyridine, m.p. 228-229° (63).]

[C with 4 moles C₆H₅MgBr in ether yields (64) (65) 2-chloro-9,10-diphenylanthracene, yel. cryst. powder, or. ndls. from AcOH, m.p. 194° (64), 193° (66), 185° (65).]

[For formn. of addn. cpds. of \bar{C} with SbCl₅ in CHCl₃ see (10); for formn. of 2-anthra-quinonylpyridinium chloride from \bar{C} + Λ lCl₃ in pyridine see (67).]

[The direct sulfonation of \bar{C} appears not to have been reported in the scientific literature although \bar{C} with fumg. H_2SO_4 at $125-130^\circ$ in pres. of Hg salts cf. (73) as directed is claimed in a patent (68) to yield 2-chloroanthraquinonesulfonic acid-5. — Two monosulfonic acids of \bar{C} are known, however, although prepared by indirect means; these are 2-chloroanthraquinonesulfonic acid-6 (corresp. sulfonyl chloride, deep yel. ndls. from chlorobenzene, m.p. 202° (69), from C_6H_6 , m.p. $202-203^\circ$ (71)), and 2-chloroanthraquinonesulfonic acid-7 (corresp. sulfonyl chloride, yel. cryst. from C_6H_6 , m.p. 205° (70), $200-201^\circ$ (71), 176° (69)); note that the alkali salts of both these acids are almost completely insoluble in aq. (71) and the above anomaly in m.p. of the sulfonyl chlorides may have been due to impure material. — \bar{C} on htg. with fumg. H_2SO_4 (40% SO₃) at 180° yields (72) a mixt. of sulfonated products which on alk. fusion give 1,2,6-trihydroxyanthraquinone (flavopurpurin) [Beil. VIII-513, VIII₁-(741)] and 1,2,7-trihydroxyanthraquinone (anthrapurpurin) [Beil. VIII-516, VIII₁-(742)].]

$$meso-\alpha,\alpha'$$
-DICHLOROSUCCINIC ACID $C_4H_4O_4Cl_2$ Beil. II - 619 $II_{1^-}(267)$ $II_{2^-}(558)$ $II_{1^-}(267)$ $II_{2^-}(558)$ $II_{1^-}(267)$ $II_{2^-}(558)$ $II_{1^-}(267)$ $II_{2^-}(558)$ $II_{1^-}(267)$ $II_{2^-}(558)$ $II_{1^-}(267)$ $II_{2^-}(558)$ $II_{1^-}(267)$ $II_{$

(9) [See also $d,l-\alpha,\alpha'$ -dichlorosuccinic acid (3:4711).]

209-213°

Hexag. pr. from aq. — \bar{C} is readily sol. aq. although less so than its d,l-isomer; e.g., 100 cc. satd. aq. soln. of \bar{C} at 0° conts. 12.0 g. \bar{C} (4); \bar{C} is eas. sol. alc., ether, acctone or CHCl3; spar. sol. C6H6 or lgr.

[For prepn. of C from disodium salt of maleic acid (1:0470) in satd. aq. NaCl soln. with Cl_2 at 0° in dark or diffuse daylight (yields: 74.5% (7), 66% (10), 65% (1)) cf. (16) see indic. refs. (note that as a side reactn. some addn. of HOCl also occurs leading to as much as 7% (1) chloromalic acid): from fumaric acid (1:0895) with excess Cl₂ in s.t. in sunlight for 3-4 days see (6); from $meso-\alpha,\alpha'$ -diaminosuccinic acid [Beil. IV-486, IV₂-(901)] in aq. HCl with NOCl or AgNO₂ (75% yield) see (3); from $meso-\alpha,\alpha'$ -dichlorosuccinyl (di)chloride (3:9087) by hydrolysis with ag. see (5).]

[For formn. of C from bis-acetyl peroxide (9) by decomposition in chloroacetic acid (3:1370) at 85-95° (CO₂ + CH₄ are also formed) see (9).]

 $\bar{\mathbf{C}}$ behaves as a normal dibasic acid: titration with standard dil. aq. alk. gives Neut. Eq. 93.5. — [For study of acid strength $(K_1 = 361 \times 10^{-4} \text{ at } 20.2^{\circ}, K_2 = 9.4 \times 10^{-4} \text{ at}$ 17.8° (4)) see (4) (8); (18) for study of conductivity see (11).]

[Salts (of metals). Ag₂A, amorphous ppt. (6) which on boilg, with aq. for 10 hrs. yields (12) both d,l-tartaric acid (1:0550) and meso-tartaric acid (1:0490); CaĀ.2H₂O, eas. sol. ag. and alc. (6); SrĀ.H₂O (6); BaĀ, very eas. sol. ag., insol. alc. (6); ZnĀ.3H₂O (6); $Cd\bar{A}.3H_2O$, very eas. sol. aq., insol. alc. (6).]

C with cold aq. KOH loses 1 HCl yielding (5) (7) (14) chlorofumaric acid (3:4853); C with NaOAc/AcOH on boilg. (13) (17) or aq. soln. of Na₂A on boilg. ½ hr. (12) loses 1 HCl yielding chloromaleic acid (3:3432); C on warming in dil. H₂SO₄ gives both (14) chlorofumaric and chloromaleic acids. [For study of rate of decompn. of C by aq., acids, or alkalies see (7) (8) (15).]

K₂Ā in aq. soln. maintained at neutrality at 100° dec. with formn. (14) of acetaldehyde (1:0100), CO_2 + meso-tartaric acid (1:0490).

C with Ac2O at 150° yields (12) chloromaleic anhydride (3:0280).

The acid chloride (3:9087) corresp. to C is known but is usually obtd. indirectly.

- Dimethyl meso- α, α' -dichlorosuccinate: m.p. 31.5-32° (see 3:0240).
- **Diethyl** meso- α, α' -dichlorosuccinate: m.p. 63° (see 3:1364).
- Acid salt of C with dl,-α-dhenylethylamine: tbls. from aq., m.p. 133-134° rap. htg. (13); satd, aq. soln, at 25° conts. 81.4 g./liter (13). [For the corresp. acid salts

of \overline{C} with the two opt. act. forms of this base see (13); both have m.p. 128-129°, and their satd. aq. solns. at 25° cont. 76.1 g./liter (13).

3:4933 4-CHLORO-3-HYDROXYBENZOIC ACID C7H5O3Cl Beil. S.N. 1068

M.P. 219.5-220.5° (1)

Colorless ndls from aq.

[For prepn. of \bar{C} from 4-amino-3-hydroxybenzoic acid (1) via diazotization and use of Cu_2Cl_2 reactn. see (1); note that the prod. formerly [Beil X-143] supposed to have been \bar{C} is now regarded (1) as probably the 6-chlorosomer (3:4720).]

3:4933 (1) Beyer, Rec. trav. chim. 40, 627 (1921).

3:4935 3,5-DICHLORO-2-HYDROXYBENZOIC $C_7H_4O_3Cl_2$ Beil. X - 104 X₁-(48) (3,5-Dichlorosalicylic acid) OH

M.P. 220-221° (1) 219-220° (2)

219.5° (3) (10)

219° (4) (5) (6) (7)

215° (8)

214° (9) (11) (12)

Colorless scales or ndls. from aq. alc.; very spar. sol. hot aq., eas. sol. alc., ether; sublimes with partial decomposition.

[For prepn. of \bar{C} from o-hydroxybenzoic acid (salicylic acid) (1 0780) in aq. KOH (3 moles) (11) (10), or in aq. KOH (1 mole) (14) (17), or in aq. KOH (2 moles) (15) (16), in EtOH (17), in AcOH (12) (10) (2), or in CS₂ susp. (17) with Cl₂ see indic. refs.; with 30% $H_2O_2 + HCl$ (80% yield) see (4); by htg. with SbCl₅ see (13). (Note that by most of these methods 5-chloro-2-hydroxybenzoic acid (5-chlorosalicylic acid) (3:4705) may also be formed; from this \bar{C} may also be sep. via its spar. sol. Ba \bar{A}_2 (17).)]

[For prepn. of C from sulfosalicylic acid with Cl₂ in aq. see (8); from K 2,4-dichlorophenolate with CO₂ at 140° see (11); from 3,5-dichlorosalicylaldehyde by oxidn. with alk.

KMnO₄ (yield 100%) see (9); from 3,5-dichloro-2-methoxybenzoic acid with 45% HI in s.t. at 120-130° see (3); from chloral-3,5-dichlorosalicylamide by hydrolysis see (1).]

 \bar{C} on htg. with CaO (17) (7) or at 200° in aniline (18) loses CO₂ yielding 2,4-dichlorophenol (3:0560).

Č with FeCl₃ gives (13) (2) a dark violet color.

[\ddot{C} in 60% fumg. H₂SO₄ treated with Cl₂ at 80–90° for 15 hrs. gives (70% yield (19)) 3,5,6-trichlorosalicylic acid, white pl. from aq. alc. or aq. AcOH, m.p. 207° cor. (19); (this with Ac₂O + trace H₂SO₄ gives corresp. acetate, ndls. from lgr., m.p. 129.5° cor. (19).]

C in AcOH treated with fumg. HNO₃ yields (20) 4,6-dichloro-2-nitrophenol, m.p. 122° (20).

 $\bar{\mathbf{C}}$ with PCl₅ (1 mole) yields (5) (10) 3,5-dichloro-2-hydroxybenzoylehloride (3,5-dichlorosalicyloyl chloride), ndls. from ether + pet. eth., m.p. 79°. [For details on various phosphorus compounds also formed in this reaction see (21).] [Note also existence of anhydride of $\bar{\mathbf{C}}$ (from the acid chloride + Ag $\bar{\mathbf{A}}$), cryst from CHCl₃, m.p. 186-187° (5) (28).]

[$\check{\mathbf{C}}$ in aq./alc./H₂SO₄ gives (22) on electrolytic reduction 3,5-dichloro-2-hydroxybenzyl alcohol, ndls. from C₆H₆, m.p. 82° (22); for study of prepn. and thermal rearr. of allyl (23), crotyl (23), benzyl (24), and other (25) ethers of $\check{\mathbf{C}}$ see indic. refs.]

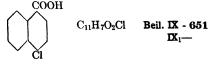

- Methyl 3,5-dichloro-2-hydroxybenzoate: ndls. from alc. or ether, m.p. 150° (15), 147° (5) (26), 143-144° (7) (3), 142° (12). [From AgĀ + MeI in s.t. at 135° (12), from 3,5-dichlorosalicyloyl chloride (above) with McOH (5), or from methyl salicylate (1.1750) in AcOH with Cl₂ (26).] [This ester with Ac₂O yields (7) corresp. acetate, ndls. from MeOH, m.p. 57° (7)]
- **D** Ethyl 3,5-dichloro-2-hydroxybenzoate: cryst. from ether, m.p. 57° (5), 47° (12). [From Ag $\overline{\Lambda}$ + C₂H₅I as above (12) (3), from 3,5-dichlorosalicyloyl chloride (above) with EtOH (5), or from ethyl salicylate (1 1755) with Cl₂ (27).]
- --- 3,5-Dichloro-2-hydroxybenzamide: m.p. 209° (11).

3:4935 (1) Hirwe, Rana, Ber. 72, 1353 (1939) (2) Hirwe, Rana, Gavankar, Proc. Indian Acad. Sci. A-8, 211 (1938). (3) Martin, Gazz chim ital. 29, II 62-63 (1899). 3:4936 4-CHLORONAPHTHOIC ACID-1

M.P. 221-223°(2) 210° (1) Ndls. from alc.; eas. sol. alc. or AcOH; spar. sol. aq., CHCl3, ether, or hydrocarbons.

[For prepn. of Č from 4-aminonaphthoic acid-1 [Beil. XIV-533] by diazotization, conversion with CuCN to 4-chloronaphthonitrile (see below), and hydrolysis of the latter by boilg, with a mixt. of 50% AcOH (2 vols.) + conc. H₂SO₄ (1 vol.) see (1); from 1-chloro-4-(chloromethyl)naphthalene, m.p. 78-79° (2), by oxidn. with dil. HNO₃ see (2); or from 1-bromo-4-chloronaphthalene [Beil. V-548, V₂-(448)] by conv. to RMgBr and carbonation see (2).]

C does not react either with conc. NH₄OH at 200° or with (NH₄)₂CO₃ at 220° (1).

Salts. The alk. salts of \bar{C} are eas. sol. aq.; the calcium, barium, and silver salts are sparingly sol. aq.; the iron, lead, and copper salts are insol. aq. (1).

- ---- Methyl 4-chloro-1-naphthoate: unreported.
- ---- Ethyl 4-chloro-1-naphthoate: unreported.
- --- 4-Chloro-1-naphthonitrile: long white ndls. from AcOH, m.p. 110° (1).
- D p-Bromophenacyl 4-chloro-1-naphthoate: m.p. 130.5-131° (2).

3:4936 (1) Friedlander, Weisberg, Ber. 28, 1840, 1842–1843 (1895). (2) Horn, Warren, J. Chem. Soc. 1946, 144.

M.P. 224.5-225.5° (1) B.P. 301° (6) 224-224.5° (2) 224° (3) 218° (4) (5) (6) (7) 217.5° u.c. (8)

White ndls. from C_6H_6 or pet. eth. — Spar. sol. hot alc. or ether; spar. sol. cold CS_2 but eas. sol. hot CS_2 ; sol. at 17° in 22 vols. or at 87° in 3.4 vols. toluene (8). — Sublimes readily. — Closely resembles hexachlorobenzene (3:4939), and the m.p. of mixtures of the two are but very slightly depressed (7) (8); furthermore, soly. of \bar{C} in C_6H_6 at 4 different temps. is alm. identical with that of hexachlorobenzene (9).

[For studies on dielectric characteristics of C see (9) (10) (11) (12).]

[For prepn. of $\bar{\rm C}$ from toluene (1.7405) with SO₂Cl₂ + AlCl₃ + S₂Cl₂ at 100° for ½ hr. as directed (72% yield (8)), or by electrolysis in AcOH/conc. HCl in dark (7), or with Cl₂ in pres. of I₂ followed by further chlorination in pres. of SbCl₅ of the fraction boiling above 240° (6) see indic. refs.; for formn. of $\bar{\rm C}$ from isopropylbenzene (cumene) (1:7440) with Cl₂ in pres. of I₂ + Fe at 0°, or from *p*-cymene (1:7505) with Cl₂ in pres. of I₂ + Fe (1), or from 2-chlorotoluenesulfonyl chloride-4 with Cl₂ in pres. of SbCl₃ at 65-70° (4), or from 2,3,4-trichlorotoluene (3:0425) or 2,4,5-trichlorotoluene (3:2100) with SO₂Cl₂ + AlCl₃ + S₂Cl₂ (8), or from 2,3,4-trichlorobenzal (di)chloride on stdg. (5) see indic. refs.]

[C on further treatment with SO₂Cl₂ + AlCl₃ + S₂Cl₂ gives (8) a prod. m.p. 272-274°. — C on fusion and treatment with Cl₂ at 210-230° as directed (13) gives 70-80% yield pentachlorobenzal (di)chloride (3:3590) b.p. 199° cor. at 13 mm. (13).

 $[\ddot{\mathbf{C}}$ on partial hydrolysis with caustic alk. at 130–140° under press. yields (14) tetrachlorocresol.]

 \bar{C} is unaffected by boilg. fumg. HNO₃ (6), but \bar{C} on oxidn. with 14.2 wt. pts. conc. HNO₃ (D=1.42) in pres. of 0.1 pt. Hg by boilg. for 150 hrs. (8) yields pentachlorobenzoic acid (3:4910), m.p. 199.5° (8).

	226-227.5° cor.	(51)					
	226-227°	(8)					
	226°	(9)	(10) (11)			
		(12)	(13)				
	224°	(14)					

(Note that \tilde{C} is *not* the same as benzenehexachloride, q.v.)

Long thin colorless pr. from CCl₄ or from C₆H₆ + EtOH. — Insol. aq.; insol. cold but sl. sol. hot alc., sol. in hot C₆H₆ (cf. {10}) or CHCl₃; at 16.5° 100 ml. CS₂ dis. 2.0 g. \bar{C} ; spar. sol. cold CCl₄ or pet. ether; for soly. in *p*-cymene at various temps. see (17); insol. liq. SO₂ or liq. NH₃. — Sublimes without melting in long needles even at ord. temp.

[For studies of cryst. structure of \tilde{C} see (18) (19). — For study of toxicity see (20). — For employment in forms, solid solns, of I_2 for use in pharmacy see (21). — For use as seed disinfectant see (22). — Mol. f.p. lowering = 207.5. — \tilde{C} resists Carius anal., but for detn, of chlorine in \tilde{C} by combusion in hydrogen see (23).]

[For prepn. of C from phthalic anhydride (1:0725) with Cl₂ at 170–265° in pres. of FeCl₃ (79% yield) see (51).]

[For prepn. of \bar{C} from tetrachlorobenzoquinone-1,4 (chloranil) (3:4978) with equal wt. each of PCl₅ and PCl₃ by htg. in s.t. at 200° for 4 hrs. (95% yield) see (24); from p-dichlorobenzene (3:0980) with 20 pts. ClSO₃H + 100 pts. NaCl htd. 10 hrs. at 210-220° (50% yield (5)) or treated with SO₂Cl₂ + AlCl₃ + S₂Cl₂ (25) see indic. refs.; from the mother liquor from prepn. of p-dichlorobenzene on further treatment with Cl₂ (94-95% yield) see (14); from 1,2,4,5-tetrachlorobenzene (3:4115) with ClSO₃H (4 pts.) refluxed for 1 hr. (78% yield (26)) or with SO₂Cl₂ + AlCl₃ + S₂Cl₂ warmed for 8 hrs. (70% yield (12)) see indic. refs.]

[For form. of \bar{C} from a very large number of miscellaneous sources and reactions see Beil. refs. given in heading and also the following: from CCl₄ (3:5100) + H₂ through hot tube at 600-650° (9) or with F₂ as directed (27); from CHCl₃ (3:5050) during explosion with Na (28); from dodecachlorohexane on htg. (29); from trichloroethylene (3:5170) + AlCl₃ + HCl gas at 50° (30) or as by-product of htg. at 180-210° under press. in glass, porcelain, or enameled vessels (31); from C₆H₆ + Cl₂ under press. (32); from nitrobenzene

+ Cl₂ + anhyd. FeCl₃ at 125° (33), cf. (34); from various addn. prods. of chlorine with trichloro- (35), tetrachloro- (36), or pentachloro- (37) benzenes usually by means of MeOH/NaOH, from 2,3,5,6-tetrachloro-N-nitroaniline, 2,3,5,6-tetrachloro-N-nitroacetanilide, or 2,3,5,6-tetrachloro-4-nitro-N-nitroaniline in boilg. AcOH + conc. HCl (8), from tetra-chlorophthalyl sym-dichloride or from pentachlorobenzoyl chloride on distn. (38).]

 $\bar{\mathbf{C}}$ with \mathbf{H}_2 over Ni at 270° gives (39) $\mathbf{C}_6\mathbf{H}_6$, chlorobenzene, dichlorobenzene, trichlorobenzene, etc. — $\bar{\mathbf{C}}$ in boilg. alc. with large excess of Na is completely dehalogenated (40). $\bar{\mathbf{C}}$ is unattacked by ICl in s.t. at 300° (41) and does *not* react with MeMgI or with MeMgBr in ether even on long boilg. (42).

[\bar{C} with liq. Cl_2 in s.t. in sunlight yields (37) by addn. both decachlorocyclohexane, m.p. 92°, and dodecachlorocyclohexane, m.p. in sealed cap. tube 285°. — \bar{C} with F_2 in CCl_4 soln. at 0° yields (43) small amts. of both hexachlorotetrafluorocyclohexane, $C_6Cl_6F_4$, m.p. 113–114°, and hexachlorohexafluorocyclohexane, $C_6Cl_6F_6$, m.p. 94–96°. — \bar{C} in vapor phase with F_2 in pres. of Cu gives a mixt. of 12 individual prods. (44).]

Č with aq. NaOH at 135–138° and 11-12 atm. for 3–4 hrs. (14) or with excess 5–15% soln. of NaOH in MeOH at 135° under press. (45) or Č with NaOH in EtOH in s.t. at 150–160° (47) or in dry glycerol at 250–280° (47) gives (80% yield (14)) sodium salt of pentachlorophenol (3.4850). — Č with MeOH/NaOH in ethyl methyl ketone soln. at b.p. for ½ hr. gives (43% yield (46)) methyl pentachlorophenyl ether, ndls. from alc., m.p. 108–109°. [For studies of kinetics of reacti. of Č with MeOH/NaOH in s.t. at 151° (2), at 176° (48), at 180° (48), at 183° (49) see indic. refs.; of Č with EtOH/NaOH or with NaOEt soln. at 175° see (2).]

 \ddot{C} on boilg, with mixt, of fumg. HNO₄ + conc. H₂SO₄ gives (50) tetrachlorobenzoquinone-1,4 (chlorantl) (3:4978).

Cryst. from alc. — $\bar{\rm C}$ is almost insol. in cold aq.; e.g., 100 ml. satd. aq. soln. at 25° conts. 0.0068 g. $\bar{\rm C}$ (33); note that $\bar{\rm C}$ is thus much less sol in aq. than m-chlorobenzoic acid (3:4392) and far less sol. than o-chlorobenzoic acid (3:4150). — At 14–16° 100 ml. satd. soln. of $\bar{\rm C}$ in acctone conts. 2.6 g. $\bar{\rm C}$, in EtOAc 1.6 g. $\bar{\rm C}$, in 75% AcOH 0.3 g. $\bar{\rm C}$, in CCl₄ 0.04 g. $\bar{\rm C}$, in C₆H₆ 0.017 g. $\bar{\rm C}$, in CS₂ 0.16 g. $\bar{\rm C}$ (22). — [For study of soly. of $\bar{\rm C}$ in acctone (8), C₆H₆ (8) (9), heptane (9) see indic. refs.]

[For study of distribution at 25° of \bar{C} between aq. + toluene or aq. + CHCl₃ see (35); for adsorption of \bar{C} on charcoal from its solns. in acctone or C_6H_6 see (8); for soly. of \bar{C} in aq. solns. of various salts (including Na $\bar{\Lambda}$) see (33).]

 \bar{C} can be sublimed in vac. (19). — \bar{C} is but very slightly volatile with steam (for details see (10)). — [For crystallographic data see (36) (37).]

Binary systems contg. \bar{C} . [For f.p./compn. data on system \bar{C} + aq. see (38). — For f.p./compn. data and diagrams of system \bar{C} + BzOH (1:0715), eutectic, m.p. 115°, contg. about 10 wt. % \bar{C} , see (22) (16); for f.p./compn. data on systems \bar{C} + p-toluic acid (1:0795) (11), \bar{C} + p-hydroxybenzoic acid (1:0840) (11), or \bar{C} + p-methoxybenzoic acid (anisic acid) (1:0805) (15) see indic. refs.]

[For f.p./compn. data and diagrams on systems $\bar{\bf C}+o$ -chlorobenzoic acid (3:4150), eutectic, m.p. 132°, contg. abt. 14 mole % $\bar{\bf C}$, see (22) (39); on system $\bar{\bf C}+m$ -chlorobenzoic acid (3:4392), eutectic, m.p. 140.9°, contg. 20 mole % $\bar{\bf C}$ (22) (39) (40), see indic. refs.]

[For f.p./compn. data and diagrams on systems $\bar{\mathbf{C}}+m$ -bromobenzoic acid (16), $\bar{\mathbf{C}}+p$ -bromobenzoic acid (16), $\bar{\mathbf{C}}+p$ -nitrobenzoic acid (41), $\bar{\mathbf{C}}+p$ -iodobenzoic acid (42) see indic. refs.]

Ternary systems contg. \tilde{C} . [For influence of addn. of \tilde{C} to the eutectic mixt. of o-chlorobenzoic acid (3:4350) with m-chlorobenzoic acid (3:4392) see (43); for data on ternary system of all three chlorobenzoic acids, eutectic m.p. 104.9°, contg. 48.3 mole % ortho + 44.0 mole % meta + 7.7 mole % para isomers, see (39).]

Miscellaneous. [For study of fate of \bar{C} in animal organism see (44) (45) (46) (47); note that conjugation with glycine to yield the expected N-(p-chlorobenzoyl)glycine (p-chlorohippuric acid) [Beil. IX-341], m.p. 143° (45), does occur. — For study of toxicology of \bar{C} see (46) (48). — Note that sodium salt of \bar{C} (see also below) is widely used under name "Mikrobin" as preservative. — For use of \bar{C} as vulcanization regulator see (49).]

Preparation. [For prepn. of \bar{C} from p-chlorotoluene (3:8287) by oxidn. with boilg. 5% aq. KMnO₄ (60% yield (51)) (22) (50) (52) (53) (133), with MnO₂ + H₂SO₄ (100% yield (51)), with CrO₃ (54), with dil. HNO₃ in s.t. at 140-145° for ½ hr. (55) or at 115-120° for 5-6 hrs. (56) see indic. refs.; from p-chlorotoluene (3:8287) by oxidn. with air in the pres. of various catalysts (57), or at 235-240° and 50-60 atm. press. in pres. of FeO.OH (58), or in aq. alk. at 260° under press. (59) see indic. refs.; for formn. of \bar{C} from p-chlorotoluene (3:8287) by electrolytic oxidn. (2) (60), by action of NOCl (30), or by long exposure to \bar{I}_2 + aq. in light (28) see indic. refs.]

[For prepn. of \bar{C} from p-chloroacetophenone (3:6735) by oxidn. with alk. KMnO₄ (61), with CrO₃/AcOH/H₂SO₄ (95% yield (7)), with Cl₂ + NaOH(NaOCl) in aq. MeOH (93% yield (62)), by liquid phase cat. oxidn. with air in pres. of MnO₂ (91% yield (6)) see indic. refs.; for formn. of \bar{C} from p-chloroacetophenone (3:6735) with NOCl see (63).]

[For form. of \bar{C} from 4-chloro-isopropylbenzene (p-chlorocumene) (3:8705) by oxidn. with HNO₃ (64) (23), from 2,4'-dichloro-biphenyl (3:0670) (65) or from 4,4'-dichloro-biphenyl (3:4300) (66) by oxidn. with $CrO_3/AcOH$, from benzal-4-chloroacetophenone (24) by oxidn. with KMnO₄ in pyridine (90% yield (24)) see indic. refs.]

[For form. of \tilde{C} from p-chlorobenzaldehyde (3:0765) by oxidn. with KMnO₄ (67) (68) (69) (70) or CrO₃ (67) or even slowly by air see indic. refs.; from p-chlorobenzaldehyde copper during recrystn. (presumably as a result of oxidn. by air) see (31).]

[For prepn. of \bar{C} from p-chlorobenzonitrile [Beil. IX-341, IX₁-(140)] by hydrolysis with 75% H₂SO₄ (71), from p-chlorobenzoyl chloride (3:6550) by hydrolysis with aq., from p-chlorobenzotrichloride (3:6825) by hydrolysis, e.g., with aq. in s.t. at 200° (72) or with aq. alk., alk. carbonates, or alk.-earth carbonates (73) (note also formn. of \bar{C} as by-prod. of prepn. of o-chlorobenzaldehyde from o-chlorobenzenal (di)chloride (3:6700) with CrO₈ (74) or on boilg. with aq. for 20 hrs. followed by oxidn. with KMnO₄ (85% yield (17)); from a mixt. of p-chlorobenzotrichloride + p-chlorobenzal (di)chloride by hydrol. with 70% H₂SO₄ or 80% AcOH or 5% NaOH at 90-100° in stream of air to effect immediate oxidn. (75) see indic. refs.]

[For prepn. of \bar{C} from 2-(p-chlorobenzoyl)benzoic acid [Beil. X-750, X_1 -(356)] by hydrolytic cleavage with aq. + CaO under press. at 325° (93% yield (7)), or from p-chlorobromobenzene via conversion to p-chlorophenyl lithium bromide (76) or to p-chlorophenyl magnesium bromide (77) and subsequent carbonation (90% yield (76)) or from chlorobenzene (3:7903) with AlCl₃ + CO₂ at 100° and 60 atm. press. (82) see indic. refs.]

[For formn. of C from benzoic acid (1:0715) with alk. NaOCl (20) cf. (78) or Ca(OCl)₂ (79) cf. (25), or from 4-chlorophthalic acid (3:4390) by cat. monodecarboxylation (80), see indic. refs.]

[For formn. of C from di-(p-chlorobenzoyl) peroxide by htg. (2) (3), from p-aminobenzoic acid via diazotization and use of Cu₂Cl₂ reaction (82% yield (83)), from p,p'-diazoaminobenzoic acid (diazoaminobenzene-4,4'-dicarboxylic acid) [Beil. XVI-728] with conc. HCl (84), from p-chloroisonitrosoacetophenone with warm Ac₂O (21), from p-chlorophenacyl bromide by conv. to quaternary salt with quinoline and treatment with aq. NaOH (18), from p-borobenzoic acid with hot aq. CuCl₂ (26), from di-(p-chlorophenzoyl)butane on pyrolysis at 255–265° for 24 hrs. (85), from ethyl p-chlorophenyl-azo-carboxylate during oxidn. with H₂O₂ in AcOH (29), from p-hydroxybenzoic acid (1:0840) with PCl₅ followed by aq. (86) (87), or from treatment with aq. of the product from p-nitrotoluene with

SOCl₂ in s.t. at 200-220° (88), p-toluenesulfonyl chloride with SOCl₂ in s.t. at 230-250° (88), or sodium p-toluenesulfonate in chlorobenzene with SOCl₂ in s.t. at 250-260° (89) see indic. refs.]

Chemical behavior. No specific account of reduction of \tilde{C} to benzoic acid appears to be on record; note, however, detn. of chlorine in \tilde{C} by use of Na + alc. (90). — \tilde{C} on reduction with formic acid at 250–260° in pres. of TiO₂ gives p-chlorobenzaldehyde (3:0765) (89% yield on \tilde{C} consumed, or 41% on \tilde{C} used (91)). — \tilde{C} on electrolytic reduction in alc./ H_2 SO₄ gives (92) p-chlorobenzyl alcohol [Beil. VI-444, VI₁-(222)], m.p. 73°, b.p. 234° (92); note proximity of m.p. of this prod. to that (72°) of corresp. prod. obtd. by similar reduction of o-chlorobenzoic acid (3:4150). — For study of reduction of \tilde{C} with H_2 + Ni in aq. alk. at ord. temp. see (93).

[C on electrolytic oxidn. in AcOH/H₂SO₄ gives (2) 4-chloro-2-hydroxybenzoic acid (4-chlorosalicylic acid) (3:4908).]

 \bar{C} behaves normally as a monobasic acid; e.g., \bar{C} on titration with standard dil. aq. alk. gives Neut. Eq. 156.5; ionization constant at 25° is 0.93×10^{-4} (94), 0.78×10^{-4} (95), 1.04×10^{-4} (96) cf. (97) (12). — [For study of acid strength of \bar{C} in various alcohols see (98) (99) (100) (13) (101) (27).—For soly. of \bar{C} in aq. solns. of various salts (including Na \bar{A}) see (33). — For sepn. of \bar{C} from o-chlorobenzoic acid (3:4150) by use of difference in acid strength see (102).]

Salts of inorganic bases. NH₄ \overline{A} (103). — Hydroxylamine salt; m.p. 130° (104). — Na \overline{A} : widely used as food preservative under name "Mikrobin"; for prepn. from \overline{C} + Na phenolate see (105); for study of influence on enzymes see (106) (107); for study of use as preservative see (108); for studies of detection and/or detn. in foods see (109) (110) (111) (112) (113) (114); forms liquid cryst. on fusion (115).

AgĀ, sol. in hot aq. (50) (1 l. satd. aq. soln. at 20° conts. 1.08 g. (118)). (Note that this salt (1 mole) with I_2 (2 equivalents) in dry C_6H_6 refluxed 15-18 hrs. yields (116) phenyl p-chlorobenzoate, m.p. $100^\circ + CO_2 + AgI$, and that analogous behavior is shown to lesser degree by corresp. salt of m-chlorobenzoic acid (3:4392) but not by corresp. salt of o-chlorobenzoic acid (3:4150).)

Ca \bar{A}_2 .3H₂O (25), 1 l. satd. aq. soln. at 20° conts. 7.37 g. (118). — Ba \bar{A}_2 .3½H₂O (66); Ba \bar{A}_2 .4H₂O (34); Ba \bar{A}_2 .H₂O (118); 1 l. satd. aq. soln. of latter at 20° conts. 1.09 g. Ba \bar{A}_2 .H₂O (118) (for use of Ba salt in sepn. of the three isomeric chlorobenzoic acids see (43)). — Cd \bar{A}_2 .2H₂O (117); 1 l. satd. aq. soln. at 20° conts. 7.79 g. (118). — For similar data on salts of \bar{C} with other heavy metals see (118) (119). — For study of various metal ions as precipitants for \bar{C} see (120).

Salts of organic bases. \bar{C} with equiv. amt. benzylamine in boilg. EtOAc followed by evapn. of solvent yields (121) benzylammonium p-chlorobenzoate, m.p. 157.4–158.4° u.c., 160.3–161.3° cor., Neut. Eq. 263.6. — \bar{C} similarly treated with α -phenylethylamine yields (121) α -phenylethylammonium p-chlorobenzoate, m.p. 150.0–151.0° u.c., 152.2–153.2° cor., Neut. Eq. 277.6.

Č (1 mole) in alc. mixed with codeine (1 mole), m.p. 155°, htd. several minutes, solvent evapd. and resultant sirup recrystd. from aq., yields (122) codeine p-chlorobenzoate, C₁₈H₂₁O₃N.Č, m.p. 162° on "Maquenne block"; note that this value although close to that (166°) of codeine p-bromobenzoate is widely different from and higher than those for the corresp. salts of either o-chlorobenzoic acid (3:4392) which are 134° and 96° respectively. — Č (1 mole) in alc. (or CHCl₃) with strychnine (1 mole) in alc., boiled for a few minutes, then cooled, yields (123) strychnine p-chlorobenzoate, C₂₁H₂₂O₃N₂.Č, m.p. 251° on "Maquenne block"; note that the m.p. of this salt is far higher than the corresp. products from similar treatment of either the o- or m- isomers, which are 170° and 185°, respectively.

C with alcohols gives by conventional processes the corresp. esters: for details on methyl

p-chlorobenzoate (3:0535) or on ethyl p-chlorobenzoate (3:6750) see these compds. — [For study of rate of esterification of \bar{C} with MeOH (124) (125) (126), with EtOH (126) (1) (127), with cyclohexanol (128) see indic. refs.]

Č with oxalyl (di)chloride (3:5060) refluxed in C₆H₆ (129), or NaĀ htd. with p-chlorobenzoyl chloride (3:6550) (130) gives (50% yield (130)) p-chlorobenzoic acid anhydride, ndls. from dil. acetone or C₆H₆, m.p. 193−194° (129) (131), 194.8° (130), 191.5° (132); note that this prod. may also form in various other reactions involving C̄, especially in pres. of tertiary bases or Na₂CO₃ cf. (131) (132).

 $\ddot{\mathbf{C}}$ with PCl₅ (133) (50) (45) (132), with SOCl₂ (134) (135) (136), with SOCl₂ + AlCl₃ (137), or with *p*-chlorobenzotrichloride (3:6825) + ZnCl₂ (138) gives *p*-chlorobenzoyl chloride (3:6550).

[\bar{C} with chlorobenzene (3:7903) + AlCl₃ refluxed 5½ hrs. gives (98% yield (7)) a mixt. consisting mainly of 4,4'-dichlorobenzophenone (3:4270) accompanied by a small proportion of 2,4'-dichlorobenzophenone (3:1565).]

[\tilde{C} with KCN + CuCN in aq. alc. htd. in s.t. at elevated temp. (139) or \tilde{C} (as K \tilde{A}) with aq. KCN + CuCN refluxed 8-10 hrs. under H₂ in quartz flask exposed to ultra-violet light (140) gives (70% yield (140)) terephthalic acid (1:0910).]

Substitution of nucleus of \bar{C} . \bar{C} on mononitration, e.g., with HNO₃ (D=1.6) on warming until soln. occurs (141), or with 10 wt. pts. HNO₃ (D=1.5) at 55–60° for 10 minutes (142), or with 4 vols. HNO₃ (D=1.5) warmed until soln. occurs (143), followed by pouring into aq. gives (yields: 97% (141), 96% (142), 90% (143)) 4-chloro-3-nitrobenzoic acid [Beil. IX-402, IX₁-(165)], cryst. from hot aq., m.p. 184° (142), 182° cor. (141), 180° (143). — [Note that boilg. conc. HNO₃ (D=1.42) has no action (143) on \bar{C} , that the crude mononitration prod. sometimes (143) contains a small amt. of p-chloronitrobenzoic acid [Beil. IX-401, IX₁-(165)], m.p. 140°, is not formed in appreciable amt. by direct nitration of \bar{C} .]

 $\bar{\mathbf{C}}$ on dinitration, e.g., with 20 wt. pts. conc. $H_2SO_4+3.3$ wt. pts. KNO₃ at 140° for $1\frac{1}{2}$ hrs. (144), or with $12\frac{1}{2}$ wt. pts. conc. $H_2SO_4+2.4$ wt. pts. fumg. HNO₃ (D=1.5) at 135-140° for 2 hrs. (145), then poured into aq., gives (yields: 95% (144), 82% (145)) 4-chloro-3,5-dinitrobenzoic acid [Beil. IX-416], pr. from C_6H_6 , m.p. 159° (144) (145). For use in detection of $\bar{\mathbf{C}}$ see (161). — [Note that none of the three other isomeric 4-chloro-dinitrobenzoic acids has ever been reported.]

[Č on sulfonation with SO₃ in fumg. H₂SO₄ (52) (146) (147) gives 4-chloro-3-sulfobenzoic acid [Beil. XI-387].]

- Methyl p-chlorobenzoate: m.p. 43° (see 3:0535).
- Ethyl p-chlorobenzoate: oil, b.p. 238° (see 3:6750).
- **p-Nitrobenzyl** p-chlorobenzoate: m.p. 130° (148). [From \tilde{C} (as Na \tilde{A}) with p-nitrobenzyl bromide (m.p. 99°) in boilg. alc. (148).]
- ◆ Phenacyl p-chlorobenzoate: m.p. 89.5° (149), 87.6° (32). [From C as (NaA) with phenacyl bromide (m.p. 50°) in boilg. alc. (98% yield (32)). Note that the m.p. of this prod. is only slightly higher than that (85.5°) of the corresp. prod. similarly obtd. from o-chlorobenzoic acid (3:4150).]
- --- p-Chlorophenacyl p-chlorobenzoate: unreported.
- **p-Bromophenacyl** p-chlorobenzoate: m.p. 126° (32). [From C (as NaA) with p-bromophenacyl bromide (m.p. 109°) in boilg. alc. (80% yield (32)).]
- --- p-Iodophenacyl p-chlorobenzoate: unreported.
- p-Phenylphenacyl p-chlorobenzoate: m.p. 160° cor. (150). [From C (as NaA) with p-phenylphenacyl bromide (m.p. 126°) in boilg. alc. (150). Note that m.p. of this prod. is only slightly higher than that (154°) of corresp. prod. similarly obtd. from m-chlorobenzoic acid (3:4392).]

- --- S-Benzylthiuronium p-chlorobenzoate: unreported.
- © S-(p-Chlorobenzyl)thiuronium p-chlorobenzoate: cryst. from dioxane, m.p. 173° cor. (151). [From Č (as NaĀ or KĀ) in aq. with 1 equiv. of S-(p-chlorobenzyl)-thiuronium chloride, m.p. 197° (10% in alc.) (151).]
- ⑤ S-(p-Bromobenzyl)thiuronium p-chlorobenzoate: m.p. 163° cor. (152). [From Č (as NaĀ or KĀ) in aq. with 1 equiv. of S-(p-bromobenzyl)thiuronium bromide (m.p. 213°) in alc. (152). Note that m.p. of this prod. is only slightly lower than that (168° cor.) of the corresp. prod. similarly obtd. from o-chlorobenzoic acid (3:4150).]
- **D** p-Chlorobenzamide: ndls. from aq. or ether, m.p. 180° (153), 179° (154), 179° (67), 178.8° cor. (155), 175° (71). [From \tilde{C} by refluxing with AcOH + (NH₄)₂CO₃ (yield 80% (153), 51% (154)), from p-chlorobenzoyl chloride (3:6550) with conc. aq. NH₄OH (50) (155) (67), or from p-chlorobenzonitrile [Beil. IX-341, IX₁-(140)] by hydrolysis with hot conc. HCl (71).]
- p-Chlorobenzhydrazide: ndls. from hot aq., m.p. 163° (157), 162-163° (156)! [From ethyl p-chlorobenzoate (3:6750) with alc. hydrazine hydrate on htg. (yield 87% (156)); for use of this prod. as reagt. for identification of aldehydes and ketones see (156).]
 - N-(p-chlorobenzoyl)-N-phenylhydrazine: unreported.
- D p-Chlorobenzanilide: ndls. from alc., m.p. 194-195° (158), 194° (50), 193° (159). [From p-chlorobenzoyl chloride (3:6550) with aniline (2 moles) (50); also from α-(4-chlorobenzophenone oxime) by Beckmann rearr. (159). Note that the m.p. of this prod. is almost the same as that (192-193°) of the isomeric benz-p-chloroanilide [Beil. XII-612, XII₁-(306)].]
- p-Chlorobenz-p-toluidide: unreported.
- p-Chlorobenz-α-naphthalide: unreported.
- p-Chlorobenz-β-naphthalide: unreported

[See also tetrachlorobenzoguinone-1,4 (chloranil) (3:4978).]

Colorless scales or ndls. from C_6H_6 ; solvated pr. from AcOH losing solvate in air (2) (8). — For crystallographic data see (9). — \bar{C} sublimes with partial decompn. (10); for study of sublimation pressure see (11).

 \tilde{C} is insol. aq.; almost insol. C_0H_0 , CCl_4 , CS_2 ; eas. sol. alc., ether; spar. sol. AcOH. [For study of ht. of formn. of \tilde{C} see (12); for studies of heat of combustion see (13) (14).] [For patent on use of \tilde{C} as vulcanization accelerator see (15).]

PREPARATION OF C

From tetrachlorobenzoquinone-1,4. For prepn. of \bar{C} from chloranil (3:4978) by reduction with various reagents see the following. [For use of aq. SO_2 see (10) (16) (note, however, that this reduction is so slow that it has been used (18) as a method of sepn. of 2,3,5-trichlorobenzoquinone-1,4 (3:4672) from tetrachlorobenzoquinone-1,4 (3:4978), and also that during the process substantial amounts of trichlorohydroquinonesulfonic acid and of dichlorohydroquinone disulfonic acid are formed (19)); for use of boilg. conc. HCl (9), conc. HBr (9) (40) in AcOH (3), with conc. HI + red (18) or yellow (20) phosphorus, or

with KI or NaI in cold acetone (38) see indic. refs.; for use of H_2S (5), $SnCl_2 + HCl$ (9) (8) (6), aq. slightly alkaline hydroxylamine (13), alc. hydrazine hydrate (21), with EtOH on exposure to direct sunlight (7) (study of quantum efficiency of the photochemical reduction (22)), or with hydroquinone (1:1590) in ether (39) see indic. refs.]

[For formn. of \bar{C} as by-product of use of tetrachlorobenzoquinone-1,4 (chloranil) (3:4978) in low-temp. dehydrogenations see (23) (24); for formn. of derivatives (ethers) of \bar{C} as by-products of reaction of chloranil (3:4978) with free radicals see (25) (26) cf. (27); for formn. of \bar{C} as by-product of reaction of chloranil (3:4978) with C_6H_8MgBr see (31).]

From 2,3,5-trichlorobenzoquinone-1,4. [For prepn. of \bar{C} from 2,3,5-trichlorobenzoquinone-1,4 (3:4672) with conc. HCl on protracted boilg. (9) (28), with fumg. HCl in s.t. at 120° for 12 hrs. (29), or in AcOH soln. with dry HCl gas (30) see indic. refs.]

From other sources. [For formn. of \bar{C} from hydroquinone (1:1590) in AcOH with Cl₂ (32), or from *p*-nitroaniline (or certain derivatives) with conc. HCl in s.t. at 180° (2), see indic. refs.]

CHEMICAL BEHAVIOR OF C

Oxidation of \bar{C} . \bar{C} on oxidation, e.g., with aq. alc. AgNO₃ (10), NH₄OH/AgNO₃ (2), boilg. conc. HNO₃ (2) (20), etc., gives tetrachlorobenzoquinone-1,4 (chloranil) (3.4978). [For studies of oxidin-reduction potential of system \bar{C} + chloranil see (33) (34) (35) (1) (27) (6).]

[Note also that the quinhydrone to be expected from \bar{C} with 1 mole of the corresp. tetrachlorobenzoquinone-1,4 (chloranil) (3:4978) is not reported.]

[Note also that, although \bar{C} dissolves in aq. KOH without discoloration, the soln. upon exposure to air turns brown and on stdg. ppts. (16) di-potassium salt of chloranille acid (2,5-dichloro-3,6-dihydroxybenzoquinone-1,4) (3:4970).]

Other reactions of $\tilde{\mathbf{C}}$. $[\tilde{\mathbf{C}}$ with PCl₅ (2 moles) gives (16) hexachlorobenzene (3:4939). — $\tilde{\mathbf{C}}$ with 2,3,5-trichlorohydroquinone (3:4052) + a little aq. htd. at 100° for $\frac{1}{2}$ hr. undergoes a redistribution reaction (28) cf. (36).]

- Tetrachlorohydroquinone dimethyl ether: m.p. 164° (37), 160° (5). [From C by action of diazomethane in ether soln. (5).]
- **D** Tetrachlorohydroquinone diethyl ether: m.p. 112° (16). [From C with EtI (2 moles) + KOH (2 moles) in alc. in s.t. at 130-140° (16).]
- (3:7065) (16) or from chloranil (3:4978) with AcCl in s.t. at 160-180° (16).
- Tetrachlorohydroquinone dibenzoate: m.p. 233° (9). [From Č with BzCl (3:6240) (9).]

3:4942 7-CHLORONAPHTHOIC ACID-1

C₁₁H₇O₂Cl Beil. S.N. 951

238-240° (3)

235° (3)

Cryst. from 60% alc. or by sublimation. — Very sol. alc. or AcOH; sol. ether, C_6H_6 . [For prepn. of \bar{C} from 7-aminonaphthoic acid-1 (1) (2) via diazotization and use of Cu₂Cl₂ reactn. see (1); from 7-chloro-1-(chloromethyl)naphthalene, m.p. 75° (3), by oxidn. with dil. HNO₃ see (3); from 7-chloro-1-bromonaphthalene [Beil. V-548] via conv. to RMgBr and carbonation see (3).]

Č with PCl₅ or SOCl₂ yields (1) 7-chloro-1-naphthoyl chloride, yel. cryst. from pet. eth., m.p. 106° cor. (1).

- Methyl 7-chloro-1-naphthoate: cryst. from 60% McOH, m.p. 54° cor. (1). [From C in MeOH with conc. H₂SO₄ (90% yield (1)).]
- Ethyl 7-chloro-1-naphthoate: unreported.
- D p-Bromophenacyl 7-chloro-1-naphthoate: m.p. 145-146° (3).
- ① 7-Chloro-1-naphthoamide: colorless ndls. from 50% alc., m.p. 237° cor. (1). [From the acid chloride (above) with 4 pts. conc. aq. NH₄OH at ord. temp. for 2 hrs. (75% yield (1)).]
- **T-Chloro-1-naphthoanilide:** brownish ndls. from dil. alc., m.p. 185° cor. (1). [From the acid chloride (above) with 5 pts. aniline at 100° (80% yield (1)).]

3:4942 (1) Goldstein, Fischer, Helv Chim. Acta 21, 1519-1521 (1938). (2) Harrison, Royle, J. Chem. Soc. 1926, 87. (3) Horn, Warren, J. Chem. Soc. 1946, 144.

3:4944 5-CHLORONAPHTHOIC ACID-1

Ndls. which sublime even below m.p. — Eas. sol. alc., spar. sol. C6H6 or AcOH.

[For prepn. of \bar{C} from α -naphthoic acid (1:0785) with Cl_2 in AcOH contg. I_2 (some of the isomeric 8-chloronaphthoic acid-1 (3:4680) also being formed) see (1); from 5-chloronaphthonitrile (see below) on hydrolysis with fumg. HCl in s.t. see (1); from 5-aminonaphthoic acid-1 [Beil. XIV-533] via diazotization and use of Cu_2Cl_2 reactn. see (1); for

formn. (together with other prods.) from α -naphthoic acid (1:0785) via reactn. with $Hg(OAc)_2$ followed by treat. with Cl_2 in AcOH see (3).]

488

Salts. CaĀ2.2H2O; sol. in 116 pts. aq. at ord. temp. (1).

 \bar{C} on soln. in red. fumg. HNO₃ gives (2) on cooling 5-chloro-8-nitronaphthoic acid-1 [Beil. IX-654], ndls. from alc., m.p. 224-225° dec. (2) (ethyl ester, m.p. 121° (2)); if the soln. of \bar{C} in red fumg. HNO₃ be heated there is also formed (2) some 4-chloro-1,8-dinitronaphthalene [Beil. V-561], pale yel. ndls. from AcOH, m.p. 180° (3), 175° (2).

- ---- Methyl 5-chloro-1-naphthoate: unreported.
- Bthyl 5-chloro-1-naphthoate: tbls. from alc., m.p. 42° (1). [From AgA with EtI in s.t. at 100° (1).]
- ---- 5-Chloro-1-naphthonitrile: ndls. from alc., m.p. 145° (1). [From α-naphthonitrile [Beil. IX-649, IX₁-(275)] with Cl₂ in CS₂ contg. I₂ (1).]
- ---- 5-Chloro-1-naphthoamide: lfts. or ndls. from warm alc., m.p. 239° (1). [From 5-chloro-1-naphthonitrile (above) on boilg. with alc. KOH for several hrs. (1).]

3:4944 (1) Ekstrand, J, prakt. Chem. (2) 38, 147-150 (1888). (2) Ref 1, pp 170-171. (3) Atterburg, Ber. 9, 928 (1876). (3) Whitmore, Fox, J. Am. Chem. Soc. 51, 3366-3367 (1929).

3:4946 TETRACHLOROPHTHALIC ACID Cl C₈H₂O₄Cl₄ Beil. IX - 819 Cl COOH COOH

M.P. See text.

[See also tetrachlorophthalic anhydride (3:4947).]

Colorless lfts., tbls., or ndls. from aq. invariably contg. $\frac{1}{2}$ H₂O, and therefore giving in this form Neut. Eq. = 156.5. — This hemihydrate can be recrystd. from anhyd. ether without change. — From anhyd. acetone the acid separates in cryst. contg. combined solv. lost in stream of dry air at room temp., yielding anhyd. \bar{C} , Neut. Eq. 152, which absorbs aq. from air giving hemihydrate. — \bar{C} on htg. at 98° or above, or on attempts to recryst. from dry C₈H₈, CHCl₃, or higher-boilg. solvents, or on long drying over P₂O₅ in vac., is converted to tetrachlorophthalic anhydride (3:4947), for this reason the m.p. observed for \bar{C} is always actually that of the corresponding anhydride. — For purification of comml. \bar{C} see (1) (13).

 $\ddot{\mathbf{C}}$ is spar. sol. aq., e.g., 100 g. aq. at 14° dis. 0.57 g., at 99° 3.03 g. of hemihydrate (2); $\ddot{\mathbf{C}}$ is eas. sol. alc. or ether (2); extremely sol. in acetone (1); spar. sol. C_6H_6 or $CHCl_3$ (2). — $\ddot{\mathbf{C}}$ is sol. in hot aq. Na_2CO_3 soln. (dif. from tetrachlorophthalic anhydride (3:4947)).

[For prepn. of Ĉ via hydrolysis of tetrachlorophthalic anhydride (3:4947) see that epd.; other methods include the following: from phthalic anhydride (1:0725) (3), from phthalyl dichloride (3:6900) (4), or phthalic acid (1:0820) (5) with Cl₂ in pres. of Fe or FeCl₃ see indic. refs.; from 2-(trichloroacetyl)-3,4,5,6-tetrachlorobenzoic acid [Beil. X-693], with dil. aq. NaOH see (6); from 2-(pentachlorobenzoyl)-3,4,5,6-tetrachlorobenzoic acid [Beil. X₁-358], with conc. H₂SO₄ at 200-250° (pentachlorobenzene (3:2290) is also formed) see (7); from naphthoquinone-1,2 (1:9062), anthraquinone (1:9095), 1,2,3,4,5,6,7-heptachloroanthraquinone [Beil. VII₁-(414)], or 2-(pentachlorobenzoyl)-3,4,5,6-tetrachlorobenzoic acid (see above) on boilg. with excess SbCl₅ + a little I₂ see (7) (8); from 1,2,3,4,5-pentachloronaphthalene [Beil. V-546] (9) (10), 1,2,3,4,5,6,8-heptachloronaphthalene [Beil. V-547] (11), or octachloronaphthalene (3:4893) (12) by oxidn. with HNO₃ in s.t. as directed

see indic. refs.; from 2,5,6,7,8-pentachloronaphthoquinone-1,4 [Beil. VII-731] by oxidn. with CrO₃ or HNO₃ see (11).]

[Č with Na/Hg in dil. aq. alc. (10) (2) yields phthalic acid (1:0825), but Č in 96% alc. with Na/Hg is practically unaffected (1) (2). — Č with H₂ in pres. of finely divided Ni at 190° and 20 atm. press. yields (14) 4,5,6,7-tetrachlorophthalide [Beil. XVII-312], m.p. 208.5° cor. — Č with HI + P in s.t. at 230° for 6 hrs. yields (2) 4,5,6,7-tetrachlorophthalane [Beil. XVII-51], ndls. from toluene, m.p. 218° (2) (insol. in boilg. aq. NaOH), accompanied by a little 4,5,6,7-tetrachlorophthalide (above) (sol. in boilg. aq. NaOH).]

 \bar{C} with CrO₃ oxidizes much more slowly (2) than phthalic acid (1:0825) and is very resistant toward HNO₃ (2); for detn. of chlorine in \bar{C} see (1) (16).

[\bar{C} with aq. KOH + KCN + CuCN htd. under press. at 180° for 8–10 hrs. gives (60% yield (15)) benzenehexacarboxylic acid (mellitic acid) [Beil. IX-1008, IX₁-(443)]. — \bar{C} with HBr + H₃PO₄ in nitrobenzene in pres. of CuCl₂ yields (17) mixts. of bromotrichlorophthalic acids and dibromodichlorophthalic acids. — For actn. of PCl₅ see under tetrachlorophthalic anhydride (3:4947). — \bar{C} with hydrazine hydrate at 150° gives only (18) N-aminotetrachlorophthalimide, colorless ndls. from AcOH, m.p. 288° dec. (18); earlier opinions (19) (20) that this prod. was tetrachlorophthalcyclohydrazide have been shown (18) to be erroneous. — \bar{C} with steam passed over cat. at 380–420° loses CO₂ presumably yielding (21) 2,3,4,5-tetrachlorobenzoic acid [Beil. IX-346], m.p. 186°.]

[For use of \bar{C} as softener for animal fibers see (22) (23). — For use of \bar{C} in prepn. of α -borneol (1:5990) from turpentine oil (crude pinene) by htg. at 108° for 12 hrs., removal of unchanged terpenes by distn. and alc. NaOH saponification of the remaining di-bornyl tetrachlorophthalate, white cryst. from ether, m.p. 128-129° (24), see (24) (25).]

Salts. K₂Ā, very sol. aq., spar. sol. alc. (2), BaĀ.2½H₂O see (2); CaĀ, on htg. gives octachloroanthraquinone [Beil. VII-789] (17); CuĀ.2H₂O, spar. sol. aq. (2) (earlier report (27) that on dry distn. it gives dodecachlorofi orane later seriously questioned (28)); ZnĀ, very sol. aq. (more sol. cold aq. than hot aq.) (2); Ag₂Ā, spar. sol. aq.

- Dimethyl tetrachlorophthalate: cryst. from MeOH, m.p. 92° (2). [From Ag₂Ā with MeI (2), from sym.-tetrachlorophthalyl (di)chloride with NaOMe (2) or from C in 10% aq. NaOH (3 moles) on warming with Me₂SO₄ (29); note that C in MeOH satd. with HCl gas gives (30) only the half ester, methyl hydrogen tetrachlorophthalate, cryst. from C₆H₆ on addn. of lgr., m.p. 142° (30) with elimination of MeOH and conversion to tetrachlorophthalic anhydride (3·4947) q.v.]
- ① Diethyl tetrachlorophthalate: cryst., m.p. 60-60.5° (2) (31). [From Ag₂Ā + EtI (2) or from sym.-tetrachlorophthalyl (di)chloride + NaOEt (2); note that unsym.-tetrachlorophthalyl (di)chloride with abs. alc. at room temp. gives (31) pseudo-diethyl tetrachlorophthalate, tbls. from alc., m.p. 126° (19), and that this cpd. on stdg. in the reactn. mixt. is partially conv. to the normal ester of m.p. 60.5° (31).]
- **Di-(p-nitrobenzyl)** tetrachlorophthalate: ndls. from C_6H_6 , or from aq. alc., m.p. $180-181^\circ$ (32), $179-180^\circ$ (33). [From Na₂ $\bar{\Lambda}$ + p-nitrobenzyl bromide on refluxing in alc. (32), or from Ag₂ $\bar{\Lambda}$ + p-nitrobenzyl iodide (33).]
- Di-(p-phenylphenacyl) tetrachlorophthalate: cryst. from acetone, m.p. 193° (34). [From Na₂Ā with p-phenylphenacyl bromide (2 moles) on htg. in alc. (34).]

3:4947 TETRACHLOROPHTHALIC ANHYDRIDE $C_8O_3Cl_4$ Beil. XVII - 484 O XVIII - (254)

[See also tetrachlorophthalic acid (3:4946).]

Colorless pr. or ndls. by sublimation. — Insol. cold aq., but sol. in boilg. aq. because of hydrolysis to tetrachlorophthalic acid (3:4946); spar. sol. ether. — Č is insol. in Na₂CO₃ soln. (dif. from tetrachlorophthalic acid (3:4946)).

[For prepn. of \bar{C} from tetrachlorophthalic acid (3:4946) by htg. above m.p. (6), by htg. 8 hrs. at 110° (7), by htg. 120 hrs. at 100° (8) (9), by sublimation, htg. at 98°, by crystn. from hot C_6H_6 , CHCl₃, AcOH (2), or by protracted drying over P_2O_5 in vac. (1) cf. (5) (10) see indic. refs.; from phthalic anhydride (1:0725) with Cl_2 in pres. of Fe salts at 160–260° (11), or with Cl_2 in pres. of SbCl₅ at 200° (10) (12), or with Cl_2 in pres. of fumg. H_2SO_4 (50–60% SO_3) and I_2 (2) (13) see indic. refs.; from naphthalene (1:7200) with $ClSO_3H$ in s.t. at 180° see (3).]

[\tilde{C} on reduction with Zn dust + hot AcOH (10) or with H_2 + Ni at 190° and 20 atm. yields (14) 4,5,6,7-tetrachlorophthalide [Beil. XVII-312], m.p. 208.5° cor.]

Č reacts with monohydric alcs. to yield corresp. half esters: e.g., Č dislvd. in excess warm MeOH, htd. 5–10 min., evapd. yields (15) methyl hydrogen tetrachlorophthalate [Beil. IX-820], cryst. from hot C₆H₆ on addn. of lgr., m.p. 139–140° (15), 142° (16), Neut. Eq. 318; Č with abs. EtOH treated as for preceding case gives (15) ethyl hydrogen tetrachlorophthalate, m.p. 93–94° (15), 94–95° (10), Neut. Eq. 332. — [Č with ter-butyloxymagnesium

bromide in ether + dioxane at 50-55° for 1 hr. gives (54% yield (17)) ter-butyl hydrogen tetrachlorophthalate, decomposing at 142°, Neut. Eq. 360; for analogous formn. of teramyl, triethylcarbinyl, tri-n-propylcarbinyl, tri-n-butylcarbinyl and tri-n-amylcarbinyl hydrogen tetrachlorophthalates see (17).] -- [For reactn. of \bar{C} with glycerol and use in prepn. of resuns of glyptal type see (3) (18).]

[\bar{C} with 1 mole PCl₅ in s.t. 4 hrs. at 220° (19) cf. (10) or \bar{C} with 1 mole PCl₅ + POCl₃ refluxed 72 hrs. (20) gives (90% yield (20)) unsym.-tetrachlorophthalyl (di)chloride (3,3,4,5,6,7-hexachlorophthalide) [Beil. XVII₁-(484)], cryst. from C₆H₆ with 1 mole solvent, m.p. 118° (10) (20), 118–120° (19), but losing C₆H₆ in air to give solvent free epd., ndls. from pet. ether, m.p. 137° (19) (20); this prod. on distn. (19) undergoes partial rearr. to sym.-tetrachlorophthalyl (di)chloride, pr. from pet. ether, m.p. 48° (19). — Note that the latter sym.-phthalyl (di)chloride (which is very soluble in most org. solvents) gradually changes even in solid form and very rapidly in solution (particularly in pres. of animal charcoal) to the unsym.-tetrachlorophthalyl (di)chloride (which is spar. sol. in most org. solvents) (19). — \bar{C} with SOCl₂ + ZnCl₂ at 200–240° yields (21) cf. (22) tetrachlorophthalyl (di)chloride but whether the unsym. or sym. forms or their mixture is not stated. — Note also that with abs. EtOH the unsym. acid chloride yields (19) pseudo diethyl tetrachlorophthalate, tbls. from alc., m.p. 126° (19), while the sym. acid chloride gives (19) sym. diethyl tetrachlorophthalate, m.p. 60.5° (19).]

[C with 2 moles PCl₅ in s.t. at 200° for 5-6 hrs. yields (10) a prod. (regarded as either 1,1,3,3,4,5,6,7-octachlorophthalide or 2-(trichloromethyl)-3,4,5,6-tetrachlorobenzoyl chloride), cryst. from ether, m.p. 140° (10), and practically unaffected by warm alc. KOH.]

[\bar{C} with arom. hydrocarbons + AlCl₃ yields corresp. o-aroyl-tetrachlorobenzoic acids: e.g., \bar{C} with C_6H_6 + AlCl₃ (23) (24) (25) or \bar{C} with C_6H_5MgBr (26) gives 2-benzoyl-3,4,5,6-tetrachlorobenzoic acid [Bell. X-750], ndls. from 80% AcOH or C_6H_6 , m.p. 201° (24), 200° (23), 188–189° (26), which on ring closure with 20 pts. conc. H_2SO_4 at 200° for 5 min. (23) gives 1,2,3,4-tetrachloroanthraquinone [Bell. VII-789], gold-yel. lfts., m.p. 191° (23). — \bar{C} with toluene + AlCl₃ gives (yields: 100% (27), 95% (28), 94% (29)) 2-(p-toluyl)-3,4,5,6-tetrachlorobenzoic acid, cryst. from C_6H_6 , m.p. 174.5° cor. (29), 172° (28) (30) (the value of 142° (27) may be a misprint for 172°), which on ring closure with 12 pts. $H_2SO_4.H_2O$ at 190–200° for 2 min. (27) or with 9 pts. fumg. H_2SO_4 (2% SO_3) at 120–130° for 30 min. (28) gives (21% yield (28)) 2-methyl-5,6,7,8-tetrachloroanthraquinone, yel. ndls. from toluene, m.p. 195–196° (27), or from EtOAc, m.p. 192° (28). — For corresp. reactns. of \bar{C} with o-xylene (1:7430), m-xylene (1:7420), p-xylene (1:7415), and ethylbenzene (1:7410) and use in identif. of these cpds. see (7). — For reactn. of \bar{C} with α -naphthyl MgBr, γ -methoxyphenyl MgBr, or γ -bromphenyl MgBr yielding corresp. o-aroyl-tetrachlorobenzoic acids see (26).]

[\bar{C} with chlorobenzene (3:7903) + AlCl₃ at 140° for 3 hrs. gives (92% yield (31)) 2-(p-chlorobenzoyl)-3,4,5,6-tetrachlorobenzoic acid, cryst. from AcOH, m.p. 162-165° (31), which with conc. H₂SO₄ at 140° for 30 min. gives 2,5,6,7,8-pentachloroanthraquinone, yel. cryst. from AcOH, m.p. 192° (31). — For corresp. reactns. of \bar{C} with p-dichlorobenzene (3:0980), with 1,2,4-trichlorobenzene (3:6420), or with nitrobenzene see (31).]

[C with phenols and appropriate condensing agents gives two different types of reactns. according to circumstances, viz., formation of corresp. o-hydroxyaroyltetrachlorobenzoic acids (cf. above) or of corresp. tetrachlorophthaleins. — E.g., C with 1 mole phenol + AlCl₃ in acetylene tetrachloride at 125° for 3 hrs. gives (yields: 79% (32), 82% (33)) 2-(o-hydroxybenzoyl)-3,4,5,6-tetrachlorobenzoic acid [Beil. X₁-(470)], lfts. from xylene/AcOH, m.p. 216-218° cor. (32), 210° (33), which with boilg. NaOH loses HCl and ring-closes to 2,3,4-trichloroxanthonecarboxylic acid-1 [Beil. XVIII₁-(499)], colorless ndls. from alc., m.p. 261-264° cor. (32), 262-265° dec. (33). — For corresp. reactns. of C with

o-cresol (1:1400) (32) (34), m-crosol (1:1730) (32), p-cresol (1:1410) (32), α-naphthol (1:1500) (38), β-naphthol (1:1540) (32), anisole (1:7445) (34) see indic. refs., with hydroquinone (1:1590) + AlCl₃ + NaCl at 150-155° for $1\frac{1}{2}$ hrs. giving 82% yield 2-(2',5'-dihydroxybenzoyl)-3,4,5,6-tetrachlorobenzoic acid, m.p. 231°, or on further htg. in the above melt at 210-215° for 1 hr. ring closing to 1,4-dihydroxy-5,6,7,8-tetrachloroanthraquinone, red cryst. from xylene, m.p. 247°, see (35). — However, \bar{C} with 2 moles phenol in pres. of fumg. H₂SO₄ (20% SO₃) as directed (8) (36) gives 65% yield phenoltetrachlorophthalein [Beil. XVIII-148, XVIII₁-(375)], m., 316-317° dec. (36), accompanied by about 10% (37) of 3',4',5',6'-tetrachlorofluoran [Beil. XIX-148, XIX₁-(676)], colorless pr. from C_6H_6 , m.p. 298° dec. (33), 290-291° (37) (for sepn. of this by-prod. from the phenoltetrachlorophthalein see (37)). — For condens. of \bar{C} with σ -cresol (1:1400) to σ -cresoltetrachlorophthalein see (45); with resorcinol (1:1530) to 3',4',5',6'-tetrachlorofluorescein [Beil. XIX-227, XIX₁-(722)] see (10) (9).]

[For condens. of \bar{C} with *m*-diethylaminophenols see (39); with *N*-aryl-*m*-aminophenols in prepn. of phthalein dyes see (40); for condens. of \bar{C} with hydroxyisodibenzanthrone in prepn. of vat dyes see (41); for use of \bar{C} as textile softener see (42).]

[C with steam passed over cat. at 380-420° loses CO₂ presumably yielding (43) 2,3,4,5-tetrachlorobenzoic acid [Beil. IX-346], m.p. 186°.]

 \bar{C} on fusion and treatment with NH₃ gas (10) (4), or on warming with formamide (2), or on fusion with (NH₄)₂CO₃ (47) gives (yields: 91% (2), 90% (47)) tetrachlorophthalimide [Beil. XXI-505, XXI₁-(391)], lfts. from AcOH, dimethylaniline or nitrobenzene, m.p. 338-339° cor. (2), 336-337° (47); for reactn. of this prod. with KOMe forming K tetrachlorophthalimide and use of latter in identification of alkyl halides, etc., see (47). — [For reactn. of \bar{C} with hydrazine hydrate in dil. alc. yielding N-aminotetrachlorophthalimide, ndls. from AcOH, m.p. 288° dec., see (48); for reactn. of \bar{C} with hydroxylamine in aq. and in MeOH see (49). — \bar{C} in boilg. AcOH treated with aniline yields (2) cf. (50) N-phenyltetrachlorophthalimide (tetrachlorophthalanil) [Beil. XXI-505, XXI₁-(391)], m.p. 274–275° cor. (2). — For reactn. of \bar{C} with o-phenylenediamine see (6).]

 \bar{C} on warming with aq., or with aq. alk. followed by acidification, yields tetrachlorophthalic acid (3:4946) q.v. [For use of differential hydrolysis of \bar{C} in sepn. from 3,4-dichlorophthalic anhydride (3:3695), 3,6-dichlorophthalic anhydride (3:4860), or 4,5-dichlorophthalic anhydride (3:4830) see under these cpds.]

3:4948 8-CHLORONAPHTHOIC ACID-2

C₁₁H₇O₂Cl

Beil. IX - 662 IX₁—

M.P. 260° (1)

Fine ndls. best purified by sublimation (1).

[For prepn. of \bar{C} from 8-aminonaphthoic acid-2 [Beil. XIV-536] via diazotization and use of Cu_2Cl_2 reactn. see (1).]

Salts. (1). CaĀ₂.7H₂O; BaĀ₂.6H₂O; both spar. sol. cold aq. but eas. sol. hot aq.

Č with Cl₂ in AcOH contg. I₂ yields (1) 5,8-dichloronaphthoic acid-2 [Beil. IX-662], ndls. from alc., m.p. 287° (1) (ethyl ester, m.p. 64-65° (1)).

- Methyl 8-chloro-2-naphthoate: unreported.
- Ethyl 8-chloro-2-naphthoate: lfts. from alc., m.p. about 29° (1). [From C in EtOH with dry HCl gas (1).]

3:4948 (1) Ekstrand, J. prakt. Chem. (2) 43, 417-418, 421 (1891).

3:4950 3,5-DICHLORO-4-HYDROXYBENZOIC C₇H₄O₃Cl₂ Beil. X - 176 X₁-(78)

White ndls. from dil. alc. or dil. AcOH; spar. sol. cold but more sol. hot aq.; eas. sol. alc., ether; sublimes at 250-260° (7) without appreciable decompn. (6).

[For prepn. of \bar{C} from p-hydroxybenzoic acid (1:0840) in 10% AcOH (4) or in aq. KOH (3 moles) (7) with Cl₂, or on htg. with SbCl₅ (4 moles) (6) or with 30% H₂O₂ + HCl as directed (80% yield (8)) see indic. refs.; from 3-sulfo-4-hydroxybenzoic acid in aq. with

Cl₂ see (9); from potassium 2,6-dichlorophenolate with CO₂ at 140° see (7); from ethyl 3,5-dichloro-4-hydroxybenzoate (see below) by hydrolysis with 35% aq. KOH (5) or with Claisen's alk. (95% yield (1)) see indic. refs.; from 3,5-dichloro-4-methoxybenzoic acid with 45% HI for 15 hrs. in s.t. at 130-140° see (3) (2).]

C on htg. with CaO (4) (7), or with dimethylaniline at 190° (78% yield (1)), or with quinoline at 190-200° (80-85% yield (10)) loses CO₂ giving 2,6-dichlorophenol (3:1595).

C in conc. aq. soln. gives with FeCl₃ a brown ppt. (4).

[\bar{C} on electrolytic reduction in aq./alc./ H_2SO_4 gives (11) 3,5-dichloro-4-hydroxybenzyl ethyl ether [Beil. VI-898], m.p. 86° (11); for prepn. and study of thermal rearr. of the crotyl ether of \bar{C} see (1).]

- Methyl 3,5-dichloro-4-hydroxybenzoate: ndls. from dil. alc. or lgr., m.p. 124° (3), 122° (12), 121-122° (4) (5). [From C in MeOH by satn. with HCl gas (3) (4); also from methyl p-hydroxybenzoate (1:1549) with SO₂Cl₂ (2 moles) (5).] [This prod. with acetyl chloride yields (5) corresp. acetate, lfts. from MeOH, m.p. 70-71° (5), 68-69° (4).]
- ⊕ Ethyl 3,5-dichloro-4-hydroxybenzoate: ndls. of monohydrate, m.p. 108-116° cor.

 ⟨1), 116° ⟨5⟩ from 80% alc.; after long drying in vac. over P₂O₅ lose aq. yielding anhydrous ester, m.p. 111-112° cor. ⟨1⟩; note that this ester is extracted from ether soln. by aq. NaHCO₃ and is also titratable with stand. alk. (Neut. Eq. of monohydrate 253). [From ethyl p-hydroxybenzoate (1:1534) with excess SO₂Cl₂ ⟨5⟩ in 85% yield ⟨1⟩.]

3:4950 (1) Tarbell, Wilson, J. Am. Chem. Soc. 64, 1066-1070 (1942). (2) Durrans, J. Chem. Soc. 123, 1426 (1923). (3) Bertozzi, Gazz. chim. ital. 29, II 39 (1899). (11) Mettler, Ber. 39, 2940 (1906). (12) von Auwers, Reis, Ber. 29, 2359 (1896).

M.P. 270° cor. (1) 263° (2)

Ndls. from alc. or AcOH. — Sol. in hot alc., in C_6H_6 or AcOH. — Sublimes in ndls. even below m.p.

[For prepn. of C from 5-amino-2-naphthoic acid [Beil. XIV-536] via diazotization and use of Cu₂Cl₂ reactn. see (2), from 5-chloro-2-naphthonitrile (below) by hydrolysis in AcOH/H₂SO₄/aq. medium (alm. 100% yield (1)) or with alc. KOH (2) see indic. refs.]

 \bar{C} with PCl₅ yields (1) 5-chloro-2-naphthoyl chloride, m.p. 89° cor., sol. in pet. eth. or C_6H_6 , but only very slowly hydrolyzed by aq. even on htg. (1).

 $\bar{\mathbf{C}}$ on mononitration by soln. in excess conc. HNO₃ (D=1.42) yields (2) on cooling 5-chloro-x-nitronaphthoic acid-2, ndls. from AcOH, m.p. 271° (ethyl ester, m.p. 118°); $\bar{\mathbf{C}}$ on dinitration with red fumg. HNO₃ + a little conc. H₂SO₄ yields (1) 5-chloro-x,y-dinitronaphthoic acid-2, ndls. from AcOH, m.p. about 243° (ethyl ester, m.p. 132°); $\bar{\mathbf{C}}$ on trinitration by conversion to mononitro- $\bar{\mathbf{C}}$ (above) and treatment with excess fumg. HNO₃ + conc. H₂SO₄ yields (1) 5-chloro-x,y,z-trinitronaphthoic acid-2, yel. cryst. from AcOH, m.p. 260-261° dec. (ethyl ester, m.p. 188°).

Salts (2). Na \overline{A} .2H₂O sol. aq.; Ca \overline{A} 2.3½H₂O, sol. in 4430 pts. cold aq.; Ba \overline{A} 2.4½H₂O, very spar. sol. cold aq.

- **D** Methyl 5-chloro-2-naphthoate: m.p. 81° cor. (1). [From $\bar{\mathbf{C}}$ in MeOH with conc. H_2SO_4 (90% yield (1)).]
- D Ethyl 5-chloro-2-naphthoate: ndls. from alc., m.p. 45° (2).

- © 5-Chloro-2-naphthoanilide: m.p 202.5° cor (1). [From the acid chloride (above) with 3 pts. aniline at 100° (90% yield (1)).]

3:4952 (1) Goldstein, Matthey, Helv. Chim. Acta 21, 65-66 (1938). (2) Ekstrand, J. prakt. Chem. (2) 43, 411-417 (1891).

3:4960 5-CHLOROISOPHTHALIC ACID COOH $C_8H_5O_4Cl$ Beil. IX - 838 (5-Chlorobenzenedicarboxylic acid-1,3)

M.P. 278° (1)

 \bar{C} cyrst. from aq. in ndls. which even after drying over conc. H_2SO_4 cont. $\frac{1}{2}$ mole H_2O ; this water is lost, however, on htg. at 120° (1). — \bar{C} is sol. at 15° in 3450 pts. aq. (1).

[For prepn. of \bar{C} from 5-aminobenzenedicarboxylic acid-1,3 (5-aminoisophthalic acid) [Beil. XIV-556, XIV₁-(636)] via diazotization and htg. sepg. diazonium salt with strong HCl see (1), from 5-chloro-3-methylbenzoic acid (3:4715) by oxidn. with KMnO₄ in dil. aq. KOH see (2)]

Salts. Na₂ $\bar{\Lambda}$, $\bar{K}_2\bar{\Lambda}$, eas. sol. aq. or alc.; Ag₂ $\bar{\Lambda}$, ndls. from aq.; Mg $\bar{\Lambda}$, 7H₂O; Ca $\bar{\Lambda}$, 2H₂O, sol. at 15° in 28 pts. aq.; Sr $\bar{\Lambda}$, H₂O, sol at 15° in 108 pts. aq.; Ba $\bar{\Lambda}$, 2H₂O sol. at 15° in 71 pts. aq.; Cd $\bar{\Lambda}$, sol. at 15° in 330 pts. aq. (for details see (1)).

- Dimethyl 5-chloroisophthalate: unrecorded.
- Diethyl 5-chloroisophthalate: pr. from alc., m.p. 45° (1). [From C in EtOH with HCl gas (1).]

3:4960 (1) Beyer, J. prakt. Chem. (2) 25, 506-515 (1882). (2) Klages, Knoevenagel, Ber. 28, 2045-2046 (1895).

M.P. 279-281° (1) 280° u.c. (2)

Colorless ndls. from hot aq. or dil. alc.; eas. sol. alc., ether, CHCl₃; insol. cold aq. [For prepn. of $\bar{\rm C}$ from 4,6-dichloro-1,3-dimethylbenzene [Beil. V-373, V₂-(291)] by

oxidn. with 20 pts. HNO₃ (D=1.18) in s.t. at 220° for several hrs. (2) or with CrO₃/AcOH (2) see indic. refs.; from 1,3-dimethylbenzene-4,6-bis-(sulfonyl chloride) (1) with SOCl₂ in s.t. at 240° for 36 hrs. see (1).]

Ag2A, white ppt. (2), BaA, H2O spar. sol. cold aq. but eas. sol. hot aq. (2).

- ① Dimethyl 4,6-dichloroisophthalate: cryst. from dil. MeOH, m.p. 97-98° (1). [From Č in MeOH on htg. (1).]
- **4,6-Dichloroisophthaldianilide:** m.p. 205° (1). [From \bar{C} on htg. with aniline (1).]

M.P. 283-284° s.t. (1) 282-284° s.t. (2)

Lustrous red lfts. with $2H_2O$ (3) (4) (lost at 100° or slowly on stdg. over conc. H_2SO_4 (3) (4)). — \tilde{C} on slow heating (even in s.t.) sublimes without melting; in s.t. inserted in bath or block preheated to about 278° , however, melts as stated above (1).

[For prepn. of \bar{C} from chloranil (tetrachlorobenzoquinone-1,4) (3:4978) by actn. of dil. NaOH at 70-80° see (3) (2); for other methods see Beil. VIII-379.]

 \bar{C} is sol. in aq. yielding violet-red solns.; at 13.5 g. 100 pts. aq. dis. 0.19 pt., at 99° 1.4 pt. anhyd. \bar{C} (3); addn. of HCl or H₂SO₄ ppts. \bar{C} decolorizing soln. (5).

Č behaves as strong dibasic ac. forming stable Na, K, Ba, Ag salts. — Na₂Ā.4H₂O, dark red (7) triclinic (8) pr. sepg. on rapid cooling of warm soln. to 18° (6); loses 2H₂O over H₂SO₄ and becomes anhyd. at 110° (7). — Na₂Ā.3H₂O, black cryst. sepg. from soln. above 35° (6). — Na₂Ā; 100 pts. aq. at 21° dis. 1.06 g., at 99° 6.19 g. (3). — Ag₂Ā, red ppt. spar. sol. aq. (8a).

 \tilde{C} htd. in s.t. with conc. H_2SO_3 soln. for some hrs. (9) or treated with Sn + HCl (9) or Na/Hg (9) yields 3,6-dichloro-1,2,4,5-tetrahydroxybenzene (hydrochloranilic acid) [Beil. VI-1156], colorless cryst., no m.p. recorded but with AcCl in s.t. at 100° yielding tetraacetyl deriv., colorless ndls. from alc. or by subl., m.p. 235° (9). [Use of insufficient SO_2 for reduction of \tilde{C} leads to pptn. of corresp. quinhydrone, fine black ndls. (9).] [For studies of oxidn.-reductn. potential of \tilde{C} see (2) (10) (11).]

 $\ddot{\mathbf{C}}$ with alk. + $\mathbf{I_2}$ - KI soln. yields (12) iodoform, m.p. 119°.

- Φ 2,5-Dichloro-3,6-dimethoxybenzoquinone-1,4 (dimethyl chloranilate) [Beil. VIII-380]: from Ag₂Ā + CH₃I (13) or from anhydrous K₂Ā + Me₂SO₄ (14); red pr. from C₆H₆ or CHCl₂, m.p. 141-142° (13) (14).
- **② 2,5-Dichloro-3,6-diacetoxybenzoquinone-1,4** (chloranilic acid diacetate) [Beil. VIII-381]: from finely pdrd. Ag₂Ā + AcCl in dry ether (15); yel. ndls., m.p. 182.5° (15).

3:4978 2,3,5,6-TETRACHLOROBENZO-QUINONE-1,4

(Tetrachloro-p-benzoquinone; chloranil)

Cl Cl Cl Beil. VII - **636** VII₁-(**347**)

[See also tetrachlorohydroquinone (3:4941).]

Golden-yellow cryst. from AcOH, acetone, C₆H₆, toluene, or by sublimation. — For crystallographic data see (13) (14) (15).

C on careful htg. sublimes without melting (16); for purification of C by sublimation (4) under reduced press. (17) (18) see indic. refs.; for study of sublimation press. of C see (19).

Č is insol. aq.; alm. insol. in cold alc.; sparingly sol. hot alc. but somewhat more readily in ether; Č is sparingly sol. CHCl₂, CCl₄, CS₂; insol. lgr.

[For study of heat of formn. of C see (20); for studies of heat of combustion see (21) (22).]

[For studies of bactericidal properties of C (23) or toxicity of C (or its associated by-products or contaminants) (24) (25) (26) see indic. refs.

 \bar{C} comprises the essential constituent (99% (27)) of the commercial fungicide "Spergon" [for studies on use of \bar{C} as (seed) fungicide see (27) (28) (29) (30) (31) (32); for studies on toxicity of \bar{C} in such use see (33)].

PREPARATION OF C

 \bar{C} because of its great resistance to further oxidation is formed as the end product of the oxidation with HCl + KClO₃ of a very large number of aromatic organic compounds [e.g., for a list of 16 such which do and 31 which do not give \bar{C} , see (34); for extension to 130 cases which do, see (35) cf. (36).]

 \bar{C} can also be prepared by a very large number of methods (see below): of these the best appear to be those from benzoquinone-1,4 (1:9025) using conc. HCl + 30% H₂O₂ at 60° (97% yield (37)) cf. (38), and from p-aminophenol by conversion with SO₂Cl₂ (10 moles) at 70° (6) or at 40-45° for 4 days (73% yield (1)) to N,N-dichloro-2,3,5,6-tetrachloro-4-aminophenol, m.p. 71.5° (6), and reaction of the latter with boilg. EtOH (1) (6) in pres. of an inert solvent (39) to give (80-85% overall yield from p-aminophenol (1)) of \bar{C} of exceptional purity and free from 2,3,5-trichlorobenzoquinone-1,4 (3:4672).

FROM VARIOUS PHENOLS

From phenol. [For prepn. of \bar{C} from phenol (1:1420) with conc. $HNO_3 + fumg$. HCl (i.e., with aqua regia) on htg. in open flask in direct sunlight (25% yield (17)) (40), or in fumg. HCl with Cl_2 followed by htg. with conc. HNO_3 at 100° for 20 hrs. (34% yield (17)) cf. (40), by electrolysis in HCl/AcOH (41), or by action of conc. $HCl + KClO_3$ (42) (43) (note, however, that this method gives (17) (44) (45) (46) (47) a product seriously contaminated with 2,3,5-trichlorobenzoquinone-1,4 (3:4672) q.v.) see indic. refs. — For prepn. of \bar{C} from phenol-contg. industrial waste waters with Cl_2 in alk. soln. followed by oxidn. with HNO_3 see (48) (49) (50) (51) (52).]

From various halophenols. From 2,4,6-trichlorophenol. [For prepn. of \bar{C} from 2,4,6-trichlorophenol (3:1673) with ClSO₃H (53), with Cl₂ + fumg. H₂SO₄ followed by ClSO₃H (90% yield (54)), with aqua regia (17) (40), with HCl + KClO₃ (42) (55), with CrO₃/AcOH (15), or with K₂Cr₂O₇/H₂SO₄ (15) see indic. refs. — Note also that many of the processes starting from phenol (above) doubtless pass through 2,4,6-trichlorophenol.]

From pentachlorophenol. [For prepn. of \tilde{C} from pentachlorophenol (3:4850) with ClSO₃H (53) (54), with cold fumg. HNO₃ (56) (57) (58), or with Cl₂ + conc. HCl at 100° (58) see indic. refs.]

From "hexachlorophenol." [For form. of \bar{C} from "hexachlorophenol" (hexachlorocyclohexadien-1,4-one-3) (3:3180) with conc. (68) or fumg. (69) HNO₃, with conc. H₂SO₄ at 100° (68) (69), with aq. or HCl in s.t. at 160° (69), or with AlCl₃ ($\frac{1}{8}$ mole) in s.t. at 160° (70) see indic. refs.]

From 2,4,6-triiodophenol. [For prepn. of \bar{C} from 2,4,6-triiodophenol with Cl_2 in boilg. AcOH soln. (100% yield) see (10).]

From various nitroso- and nitro-phenols. [For prepn. of \bar{C} from p-nitrosophenol in conc. HCl at 90° with Cl₂ see (59).]

[For form. of \tilde{C} from o-nitrophenol (17) (40) (60), p-nitrophenol (17) (40) (60), 2,4,6-trinitrophenol (picric acid) (17) (40) (61) with aqua regia, or from picric acid with Cl_2 (61) or $Cl_2 + I_2$ (62) in hot aq. soln., or from picric acid with $HCl + KClO_3$ (42) (47) see indic. refs.; for formn. of \tilde{C} from p-nitrophenol or 2,4-dinitrophenol with aq. NaOCl soln. see (63).]

From polyhydric phenols. From resorcinol. [For formn. of C from resorcinol (1:1530) with ClSO₃H (40 wt. pts.) at 150-160° for 25 hrs. (note that much 2,3,5-trichlorobenzo-quinone-1,4 (3:4672) is also formed) see (64) cf. (54).]

From hydroquinone. [For formn. of \bar{C} from hydroquinone (1:1590) with Cl_2 in AcOH (5), with Cl_2 + conc. HCl at 100° (65) (53), with aqua regia (4), with $ClSO_3H$ at 150-160° (8) see indic. refs.; for formn. of \bar{C} from hydroquinone-pyridinium chloride with SOCl₂ (2) or from hydroquinone-2,6-bis-(sulfonyl chloride) with PCl_5 in s.t. at 140-150° for 6 hrs. (67) see indic. refs.]

From pyrogallol. [For formn. of C from pyrogallol (1:1555) with ClSO₃H at elevated temp. see (66).]

From various quinones. From p-benzoquinone. [For form. of \bar{C} from benzoquinone-1,4 (1:9025) with Cl_2 in conc. HCl (53) (65) with Cl_2 in AcOH (71) cf. (72), or with $HCl + KClO_3$ (42) see indic. refs.]

From the dichloro-p-benzoquinones. [For form. of C from 2,3-dichlorobenzoquinone-1,4 (3:2855), from 2,5-dichlorobenzoquinone-1,4 (3:4470), or from 2,6-dichlorobenzoquinone-1,4 (3.3750) with Cl₂ in CHCl₃ see (73).]

From trichloro-p-benzoquinone. [For formn. of \bar{C} from 2,3,5-trichlorobenzoquinone-1,4 (3:4672) with $Cl_2 + I_2 + aq$. (47), or with $Cl_2 + HCl$ (65), see indic. refs.]

From various amines. [For form. of \bar{C} from aniline in 10% HCl by electrolytic oxidation (23% yield (9)) (74), with HCl + KClO₃ (75) (76), with Na₂Cr₂O₇ + HCl (89), or with aqua regia (60) see indic. refs. — For form. of \bar{C} from diphenylamine, 2,4-dichloroaniline, m-nitroaniline, aniline black, or phenylhydrazine with aqua regia see (60).]

[For form. of \bar{C} from p-phenylenediamine with aqua regia (60) (4), with ClSO₃H (large excess) at 150-160° for 5 hrs. (77), with Cl₂ in AcOH (78), or with HCl + KClO₃ (3) see indic. refs.; from 2,6-dichloro-p-phenylenediamine with HCl + KClO₃ see (79).]

[For formn. of \bar{C} from o-aminobenzoic acid (anthranilic acid) (42) (80), m-aminobenzoic acid (80), p-aminobenzoic acid (80), p-tyrosine (α -amino- β -(p-hydroxyphenyl)propionic acid) (81) with HCl + KClO₃ see indic. refs.; from sulfanilic acid (aniline-p-sulfonic acid) with aqua regia see (60).]

[For form. of \tilde{C} from 2,3,5,6-tetrachloro-p-phenetidine by diazotization and boilg. see (82).]

From miscellaneous sources. [For formn. of \bar{C} from 1,2,4,5-tetrachlorobenzene (3:4115) as by-product of nitration with fumg. HNO₃ see under (3:4115), from hexachlorobenzene (3:4939) on boilg. with mixt. of fumg. HNO₃ + conc. H₂SO₄ see (83); from N-nitro-2,4,6-trichloroaniline in dil. alc. or AcOH soln. with HCl or H₂SO₄ see (84); from N-nitro-acet-2,3,5,6-tetrachloroanilide on bollg. in toluene or xylene see (85); from tetrachlorobenzo-quinone-1,4-mono-(2,4,6-trichlorophenylimide) by H₂SO₄ hydrolysis see (86); from various azo dyes by oxidn. with NaOCl soln. at 0° see (87); from anisolesulfonic acid or phenetolesulfonic acid in aq. soln. with Cl₂ see (88); from nitrobenzene with ClSO₃H (20 wt. parts) at 150° for 20 hrs. (95% yield) see (7).]

CHEMICAL BEHAVIOR OF C

REDUCTION OF C

C upon reduction by a wide variety of reagents gives tetrachlorohydroquinone (3:4941) the text of which should be consulted for details.

OXIDATION OF C

Č is extremely stable to oxidizing agents in neutral or acid soln. and is unaffected by aqua regia or hot conc. HNO₃.

BEHAVIOR WITH CHLORINE

[C with MnO₂ + conc. HCl in s.t. at 180° for 10 hrs. adds 1 mole Cl₂ giving (45) hexachlorocyclohexen-2-dione-1.4 [Beil. VII-574], m.p. 89° (45).]

BEHAVIOR WITH OTHER INORGANIC REACTANTS

In many of the reactions of \bar{C} with other reagents, 2 of the chlorine atoms are often replaced by other groups as exemplified below.

With aqueous alkali. \bar{C} with dil. aq. alk. at 70-80° readily replaces 2 chlorine atoms by hydroxyls giving (16) (3) (90) (91) (92) 2,5-dichloro-3,6-dihydroxybenzoquinone-1,4 (chloranilic acid) (3:4970), m.p. 282-284° s.t. (92).

With ammonia. [C with alc. NH₃ on boilg, replaces 2 chlorine atoms by amino groups giving (75% yield (103)) (93) (94) 2,5-dichloro-3,6-diaminobenzoquinone-1,4 (chloroanilamide) [Beil. XIV-144]. — Note, however, that C with aqueous NH₄OH gives (16) 2,5-dichloro-3-amino-6-hydroxybenzoquinone-1,4 (chloranilamic acid) [Beil. XIV-250].]

With various salts. [\bar{C} with sodium azide as directed (95) (96) gives 2,5-dichloro-3,6-bis-azidobenzoquinone-1,4. — \bar{C} with NaNO₂ (2 moles) in conc. aq. soln. on warming gives (97) cf. (98) 2,5-dihydroxy-3,6-dinitrobenzoquinone-1,4 (nitranilic acid) [Beil. VIII-384, VIII₁-(683)]. — \bar{C} with KCN (2 moles) in 85% MeOH gives (99) 2,5-dihydroxy-3,6-dicyanobenzoquinone-1,4 (cyananilic acid) [Beil. X₁-(520)].]

[\tilde{C} with warm dilute aq. acid KHSO₃ gives mainly (100) (101) the salt of 2,5-dichloro-3,6-disulfohydroquinone [Beil. XI-301], while with conc. solns. (100) or with neutral K₂SO₃ (101) (102) the main prod. is the salt of thiochronic acid [Beil. XI-302, XI₁-(80)], now (102) recognized as cyclohexadien-2,5-ol-4-one-1-pentasulfonic acid-2,3,4,5,6.]

With PCl₅. [C with PCl₅ + PCl₃ in s.t. at 190-200° for 4 hrs. gives (95% yield (104)) cf. (43) hexachlorobenzene (3:4939); note also, however, that C with PCl₅ + PCl₃ at 135-140° followed by treatment with aq. may also yield (45) (105) mono-(pentachlorophenyl)-phosphoric acid (monohydrate), m.p. 224° (105), and other products.]

BEHAVIOR OF C WITH ORGANIC REACTANTS

With aromatic hydrocarbons. [C with various aromatic hydrocarbons yields addition compounds: e.g., C with 1,2,4,5-tetramethylbenzene (durene) (1:7195) in hot AcOH gives (106) (107) a red cpd. C.2 durene; C with hexamethylbenzene (1:7265) gives from hot AcOH (108) violet-brown ndls. of a 1:1 cpd., m.p. 198-202° (108) (for further study of this prod. see (109) (110)); C with acenaphthene (1:7225) gives (111) (112) from AcOH (107) a violet 1:1 addn. cpd.]

With dienes and other unsaturates. \bar{C} with many dienes and other highly unsaturated compounds forms addn. products and/or gives color reactions.

[Č with cyclopentadiene (1:8030) in C₆H₆ in pres. of a little Me₃N gives (113) a 1:1 addn. cpd., yellowish ndls. from abs. alc., m.p. 146-146.5° (113) (corresp. dibromide with Br₂ in CHCl₃ in direct sunlight, lfts. from AcOEt, m.p. 269° (113)); note that in absence of Me₃N yield in 14 days is only 40%, in presence of Me₃N 100% (for study of cat. influence of Me₃N and of CCl₃.COOH see (114)).]

[For study of color reactions of \bar{C} in CHCl₃ soln. with various trienes see (115) cf. (116) (117).]

[For studies of influence of \bar{C} on polymerization of styrene (1:7435) see (118) (119) (120); for study of effect of \bar{C} on polymerization or depolymerization of natural rubber see (121); for use of \bar{C} as vulcanization accelerator see (122).]

With organic OH (or SH) reactants. With alcohols. [C in boilg. MeOH gradually treated with calcd. amt. 1% MeOH/KOH gives (123) (124) a mixt. of 2,5-dichloro-3,6-

dimethoxybenzoquinone-1,4 (chloranilic acid dimethyl ether) [Beil. VIII-380], dark red pr. from C₆H₆, m.p. 141-142° (123), and 2,6-dichloro-3,5-dimethoxybenzoquinone-1,4 (isochloroanilic acid dimethyl ether) [Beil. VIII-387], dark red pr., m.p. 159° (125) (126), 157-158° (123), 155.5° (127). — Note, however, that \tilde{C} with MeOH/NaOMe (5-6 moles) gives 2,5-dichloro-3,6-dimethoxybenzoquinone-1,4-bis (monomethyl acetal) [Beil. VIII-381] accompanied by tetrachlorohydroquinone (3:4941).]

With phenols. [C (1 mole) with phenol (2 moles) in aq. KOH at 100° gives (128) 2,5-dichloro-3,6-diphenoxybenzoquinone-1,4 (chloranilic acid diphenyl ether) [Beil. VIII-380], dark red pr. from C₆H₆, m.p. 243° (128). — C (1 mole) with aq. K p-cresolate (2 moles) at 100° gives (129) 2,5-dichloro-3,6-di-(p-toloxy)benzoquinone-1,4 (chloranilic acid dip-tolyl ether) [Beil. VIII₁-(681)], cryst. from toluene, m.p. 254-255° (129).]

With mercaptans. [Č (1 mole) with EtSH (4 moles) with EtOH/KOH (4 moles) as directed gives (95% yield (130)) 2,3,5,6-tetra-kis-(ethylthio)benzoquinone-1,4 [Beil. VIII-535], dark green ndls. from alc., m.p. 90-91° (131).]

With thiophenols. [Č (1 mole) with C₆H₅SH in alk. soln. might be expected to yield 2,3,5,6-tetra-kis-(phenylmercapto)benzoquinone-1,4, but neither this reaction nor the expected product appears to have been reported. — However, various analogous cases are known: e.g., Č (1 mole) with p-thiocresol (4 moles) in AcOH at 100° for ½ hr. gives (132) 2,3,5,6-tetra-kis-(p-tolylthio)benzoquinone-1,4, cryst. from AcOH, m.p. 203° (132). — Č (1 mole) with o-nitrothiophenol in boilg. EtOH for 1 hr. gives (96) 2,3,5,6-tetra-(o)-nitrophenylmercapto)benzoquinone-1,4, no m.p. given.]

With organic amines. General. The behavior of \bar{C} with aliphatic amines appears to have been little studied from the structural viewpoint. [However, for studies on color reactions of \bar{C} with prim., sec., and ter-amines (or their salts) (133), for use of \bar{C} (in epichlorohydrin soln.) as a test for plasmochin (134) (135), or for use of \bar{C} in detection of MeNH₂, Me₂NH, or Me₃N and differentiation from NH₃ (136) (137), for use in spot test reactions of 38 different amines (147) see indic. refs.]

With primary aliphatic amines. [C with MeNH₂ might be expected to give 2,5-dichloro-3,6-bis-(methylamino)benzoquinone-1,4 or even 2,3,5,6-tetra-kis-(methylamino)benzoquinone-1,4, but the reaction has not been reported and neither product is known.]

With primary aromatic amines. [\bar{C} with aniline in boilg. alc. refluxed 30 min. gives (81% yield (138)) (100) (93) (139) 2,5-dichloro-3,6-dianilinobenzoquinone-1,4 [Beil. XIV-144, XIV₁-(421)], yel.-br. lfts. from C_6H_6 or nitrobenzene, m.p. 292-293° (138), 290° (140), 288-290° (141); note that this product serves as bases for prepn. of many complex dyestuffs which cannot be discussed here. — \bar{C} with many other homologous and analogous primary aromatic amines behaves similarly.

[\bar{C} with phenylhydrazine in absol. alc. evolves N_2 and gives (10) a chlorine-contg. prod., m.p. 229-230°, of undetermined structure.]

With various organometallic reactants. [\tilde{C} (1 mole) in alc. with diethyl sodiomalonate (4 moles) in C_6H_6 gives (10% yield (142)) tetraethyl 2,5-dichloro-p-benzoquinone-3,6-dimalonate [Beil. X-940], yel. ndls. from alc., m.p. 132° (143).]

[For behavior of C with ethyl sodio-acetoacetate see (144) (145), Beil. X-860, and Beil. X-935.]

[For behavior of C with excess C₆H₅MgBr see (146).]

© Color tests for C. Of the large number of color tests shown by C with various reactants, the following have been especially employed as preliminary tests for C itself; note that for details, limitations, etc., the original references should be consulted.

With dimethylaniline. C on warming with dimethylaniline gives intense violet color (Mulliken).

With ethyl cyanoacetate. C with ethyl cyanoacetate (2-3 drops) + excess alc. NH₄OH (2-3 ml. of mixt. of 1 pt. abs. EtOH + 1 pt. conc. NH₄OH) gives intense bluish-violet coloration, changing to blue, green, and finally reddish brown (148). [Note that the reaction is also shown by certain other quinones, e.g., benzoquinone-1,4 (1:9025), o-toluquinone, thymoquinone, and naphthoquinone-1,4 (1:9040), but is not given by anthraquinone (1:9095), phenanthraquinone (1:9086), naphthoquinone-1,2 (1:9062), or 2,5-dichloro-3,6-diaminobenzoquinone-1,4 (chloranilamide) (148)]

With triphenylphosphine. \bar{C} with 20% soln. of $(C_6H_5)_3P$ in CHCl₃ gives (149) a winered color. [Note, however, that a similar behavior is also shown by 2,3,5-trichlorobenzo-quinone-1.4 (3:4672) and certain other quinones (149).]

M.P. 306-306.5° (1) 305-306° cor. (2) 305° (3)

Colorless ndls. from hot aq.; sublimes on cautious gradual htg.

[For prepn. of $\bar{\mathbb{C}}$ from 2,5-dichloro-1-methyl-4-isopropylbenzene (2,5-dichloro-p-cymene [Beil. V-423, V_{2} -(326)] by oxidn. with 20 pts. HNO_3 (D=1.15) in s.t. at $180-200^\circ$ for 10-12 hrs. (1) (3) see indic. refs.; from 2,5-dichlorocyclohexadiene-1,4-dicarboxylic acid. 1,4 (2,5-dichloro-3,6-dihydroterephthalic acid) [Beil. IX-785] in 12% yield by short boilgwith 20% HNO_3 (some 2,5-dichloro-3-nitroterephthalic acid is also formed) see (4) (2); from 2,5-dichloro-1,4-bis-(trichloromethyl)benzene (5) by hydrolysis with H_2SO_4 (66° B6) at $70-80^\circ$ see (5).]

 $Ag_2\bar{A}$, insol. aq. (2); $Ba\bar{A}$, $4H_2O$, very eas. sol. aq. (2).

[The acid chloride corresp. to Č, viz., 2,5-dichloroterephthaloyl (di)chloride, cryst. from lgr., m.p. 80.5-81° (6), has been obtd. indirectly (6) from 2,5-dichloro-3,6-dihydroterephthalic acid (above) by actn. of PCl₅.]

[A mononitro- \bar{C} , viz., 2,5-dichloro-3-nitroterephthalic acid [Beil. IX-852], pale yel. ndls. from conc. aq. soln., m.p. 225-226° dec. (2) (corresp. dimethyl ester, m.p. 207-208° dec. (2)), has been obtd. indirectly as stated above.

- Dimethyl 2,5-dichloroterephthalate: lfts. from MeOH, m.p. 137-138° (7) (5), 136° (6) (3). [From C in MeOH with HCl gas (2), or from 2,5-dichloroterephthaloyl dichloride in MeOH (6).]
- --- Diethyl 2,5-dichloroterephthalate: unreported.
- 2,5-Dichloroterephthaldiamide: ndls. from aq., m.p. above 300° (6). [From 2,5-dichloroterephthaloyl dichloride in ether with NH₃ (6).]

3:4985 (1) Bocchi, Gazz. chim. ital. 26, II 406 (1896). (2) Levy, Andreocci, Ber. 21, 1959-1964 (1888). (3) Wheeler, Giles, J. Am. Chem. Soc. 44, 2611 (1922). (4) Levy, Andreocci, Ber. 21, 1467-1468 (1888). (5) I.G., French 663,781, Aug. 26, 1929; Cent. 1929, II 2731-2732. (6) Levy, Curchod, Ber. 22, 2109-2111 (1889). (7) Fels, Z. Krist. 32, 411 (1900).

M.P. 312° (1) 310° (2) (3) 297° (4) (5) (6)

[See also α -benzenehexachloride (3:4410).]

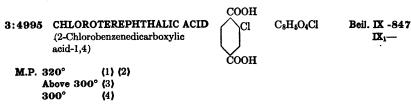

Nine stereoisomeric configurations of benzenehexachloride are possible (cf. (2)) and four are known; of these \bar{C} has definitely been shown (7) to be the *sym.-trans* stereoisomer; α -benzenehexachloride (3:4410) is probably the *sym.-cis* stereoisomer; the configurations of the γ -isomer, m.p. 112–113° (8), and the δ -isomer, m.p. 129–132° (8), are unknown.

 \bar{C} cryst. from C_6H_6 (8), alc. (10), or xylene. — \bar{C} is not volatile with steam (dif. and sepn. (10) from α -isomer) but sublimes after melting. — \bar{C} is sol. in 775 pts. CHCl₈ at 20° or in 213 pts. C_6H_6 at 17.25° (9) (note much less soly. than for α -isomer); 100 g. C_6H_6 at 22° dis. 1.204 g. \bar{C} (10); 100 g. AcOH at 15.6° dis. 0.289 g. \bar{C} (10). — \bar{C} forms with the α -isomer a eutectic, m.p. 155.5° (8), contg. 20.3% \bar{C} (8).

[For prepn. of \bar{C} or its mixt. with the α -benzenehexachloride see the latter (3:4410).]

 \ddot{C} is much more unreactive than the α -isomer; e.g., \ddot{C} is unaffected by boilg. alc. KCN (3) (10) and is only slightly attacked by boilg. pyridine (8). However, \ddot{C} on boilg. 4 hrs. with alc. KOH gives 100% yield (8) of a mixt. of trichlorobenzenes contg. 86.4% 1,2,4-trichlorobenzene (3:6420), 8.3% 1,3,5-trichlorobenzene (3:1400), and 5.3% 1,2,3-trichlorobenzene (3:0990) (8).

CHAPTER XII

DIVISION B. LIQUIDS WITH BOILING POINTS REPORTED AT ORDINARY PRESSURE

Section 1. D_4^{20} greater than 1.1500

(3:5000-3:5499)

3:5000	PHOSGI (Carbony		oride)		•	COCl ₂	Beil. III - 13 III ₁ -(7) III ₂ -(12)
B.P.				F.P.				
8.2° co	r. at 756.4	mm.	(1)	[-118°	(7)]	$D_4^{186} = 1.392$	(1)	•
8.2°	at 756	mm.	(2)	-126°	(6)	-	-	
8.1°	at 756	mm.	(3)	-127.5°	(5)	See Note 2.		
8.02°	at 760	mm.	(4)	-128°	(6)			
7.95°	at 760	mm.	(5)					
7.89°	at 765.8	mm.	(4)					,
6.96°	at 760	mm.	(6)					

See Note 1.

Note 1. For studies of vap. press. of \bar{C} over range -96.3° (1.1 mm.) to 5.0° (678 mm.) (5); over range -88.94° (0.5 mm.) to $+12.6^\circ$ (889.2 mm.) (3); over range -79° (4.0 mm.) to $+50.0^\circ$ (5.11 atm.) (6); over range -23.42° (191.2 mm.) to $+25.03^\circ$ (1410.9 mm.) (4); over ranges 0° (556.5 mm.) to $+27.9^\circ$ (1540 mm.) and $+147.6^\circ$ (35.6 atm.) to $+182.5^\circ$ (56.4 atm.) (8) see indic. refs.

Note 2. For extensive studies on density of liquid C see (6) (4) (367).

Č at ord. temps. is a colorless gas with highly characteristic odor. It now is sold commercially in metal tanks or dissolved in an organic solvent such as toluene or CCl₄. Iron containers which have been used for long periods for storage of Č may contain small amounts of liquid iron pentacarbonyl.

 \bar{C} was first prepd. by John Davy in 1812 (9); for extensive history see (10). For general surveys on chemistry of \bar{C} (11) (12) from viewpoint of chemical warfare agent (13) (14) (15) (16) (17) (18) (19) see indic. refs.; for a bibliography of \bar{C} and its derivatives see (35).

MISCELLANEOUS PHYSICAL PROPERTIES OF C

[For studies on heat capacity from spectroscopic data (20) and other thermodynamic functions of \tilde{C} (21) (22) see indic. refs.; for studies on dipole moment (23) (24), dielectric const. (25), molecular structure (26) (27), and electron diffraction (28) of \tilde{C} see indic. refs.; for study of refractive index of \tilde{C} as gas see (29); for studies of critical temp. (181.75° (8), 183° (30), 187° (4)) and critical press. (55.3 atm. (8)) see indic. refs.]

 \bar{C} is readily sol. in C_6H_6 , toluene, or AcOH [for studies of solubility of \bar{C} in C_6H_6 at 20° (31), toluene over range 17-31.5° (6), xylene (6), EtOAc at 20° (31), nitrobenzene (6), CCl₄ (3:5100) at 20° (31), 1,1,2,2-tetrachloroethane (3:5750) (6), chlorobenzene (3:7903) (6), or 1-chloronaphthalene (3:6878) (6) see indic. refs.; for soly. of \bar{C} in various org.

solvents at pressures below 1 atm. see (32) cf. (33); for patent on removal of \bar{C} from contaminated drinking water by extraction with org. solvents see (34)].

[For technical papers (36) (37) (38) (39) (40) (41) (42) (43) (44) (45) and patents (46) on adsorption of \bar{C} by various forms of carbon see indic. refs.]

[For influence of \ddot{C} in extinction of H/O flames see (47).]

PHYSIOLOGICAL ASPECTS OF C

Č is more than ten times as toxic as Cl₂. An atmosphere contg. 1 part by vol. of Č in 6000 may cause lung injuries in 2 min., 1 part in 30,000 is very dangerous, and 1 part in 200,000 is probably fatal for exposures of 30 min. The maximum permissible concn. for prolonged exposure is about 1 p.p.m., i.e., 0.004 mg./l. (48).

The least detectable odor of \bar{C} is 5.6 p.p.m., the least conen. that affects the throat is 3.1 p.p.m., the least conen. that causes irritation of the eyes is 4.0 p.p.m., the least conen. that causes coughing is 4.8 p.p.m. (48) (49). A conen. of 0.02-0.05% is lethal to most animals in a short time, a conen. of 0.0025% is dangerous for exposures of 30-60 min., and the maximum conen. to which animals can be exposed for several hours without serious effects is 0.0001% or 1 p.p.m. (48) (50).

[For report of industrial accidents from \bar{C} (51), for legal (British) aspects of industrial poisoning by \bar{C} (52), for toxicology and treatment of poisoning by \bar{C} (53), for immunization against \bar{C} (54), for variations in toxicity of \bar{C} for small animals with duration of exposure (55) see indic. refs.]

[For studies relating to chemical warfare aspects of C with respect to foodstuffs see (56) (57).]

USES OF C

Apart from the uses of \bar{C} as a chemical warfare agent (above), many chemical utilizations are indicated below under its chemical behavior. [In addition will be mentioned here a few further examples as follows: for use of mixt. of \bar{C} + HF for cracking of hydrocarbon oils see (58); for use as dehydrating agent in conversion of amides to corresp. nitriles see (59); for use in sepn. of Pt metals see (60).]

DETECTION OF C

Č may be detected by its characteristic odor (see above) and by various color reactions of which the following represent the more important types.

For detection of \tilde{C} by the yellow or orange color produced by reaction with Harrison's reagent (a soln. in EtOH (100 ml.) of p-dimethylaminobenzaldehyde [Beil. XIV-31, XIV₁-(360)] (5 g.) (for prepn. see (61)) and of diphenylamine [Beil. XII-174, XII₁-(163)] (5 g.)) see (62) (63) (64) (65) (66) (67) (68) (69) (70) (71) (83); note that this test suffers interference from HCl, Cl₂, ClSO₃H, TiCl₄, chloromethyl chloroformate (3:5275), diphosgene (3:5515), and triphosgene (3:1915); for application of this reagent in an absorptive tube see (72) cf. (73).

For detection of C by green color imparted to a test paper impregnated with a xylene soln. of 0.5% 6-nitroso-3-dimethylaminophenol (4-dimethylamino-o-benzoquinoneoxime-1) [Beil. XIV-131] and a xylene soln. of 0.5% m-diethylaminophenol [Beil. XIII-408, XIII₁-(130)] see (74) (75) (76).

For spot test detection of Č by use of phenylhydrazine cinnamate (for prepn. see (77)) in CHCl₃ or CCl₄ followed by treatment with 1% CuSO₄ soln. to give a red-violet color from the 1,5-diphenylcarbohydrazide [Beil. XV-292, XV₁-(72)] produced see (78).

For study of detection of C with resorcinol (1:1530) or vanillin (1:0050) see (79); by

indirect use of the Gilman color test for RMgX compounds see (80) cf. (81); for study of utility of various dyestuffs in detection of \bar{C} see (82).

DETERMINATION OF C

Methods for the quant. detn. of C may be classified under three main types according to whether they are based upon hydrolysis, reaction with alkali iodides, or reaction with aniline.

Detn. by methods based on hydrolysis. [For studies of methods based upon alkaline hydrolysis of \bar{C} and subsequent detn. of resultant chloride ion see (83) (84) (85) (86) (87) (88) (89) (90); for especial criticism of this method see (91).]

Detn. by reaction with alkali iodide. [For studies of methods based upon reaction of \bar{C} with NaI (92) (91) or KI (93) in acetone followed by thiosulfate titration of the liberated I₂ see indic. refs.]

Detn. by reaction with aniline. [For study of methods based upon reaction of \bar{C} with aniline and gravimetric estn. of the resultant N,N'-diphenylurea (carbanilide) (94) (95) cf. (91) or titration of the residual aniline HCl in the filtrate (96) see indic. refs.]

Related topics. [For detn. of small amts. Cl_2 in pres. of \tilde{C} (97), of HCl in \tilde{C} (98) (85), for analysis of mixts. of \tilde{C} + Cl_2 + NOCl (99), for anal. of mixts. of \tilde{C} with CO, CO₂, Cl₂, CCl₄, C₂Cl₆ (88) (86), for anal. of industrial \tilde{C} (89), or for detn. of \tilde{C} in air by means of an ultraviolet photometer (R. + H. Tri-Per Analyzer) (100) see indic. refs.]

PREPARATION OR FORMATION OF C

From CO + Cl₂. The photochemical reaction of CO with Cl₂ to yield \bar{C} was the method by which it was first prepared in 1812 (9) (for extensive history see (10)). Over the years the reaction has been very extensively studied. The more important earlier reports include those of Wilm and Wischin (101), Wildermann (102), Dyson and Hardin (103), Weigert (104), Coehn and Becker (105), Chapman and Gee (106), etc. Since 1920 the number of studies of this reaction has so greatly increased as to preclude in this text any detailed analysis; however, the following references ((107)–(134), incl.) arranged in receding chronology will be found fruitful from one viewpoint or another.

[For studies on formn. of \bar{C} from CO + Cl₂ in dark at 349-452° (135) in liq. medium (145), or over cat. such as Pt at 300-400° (136), activated carbon (6) (137), or AlCl₃ at 30-35°, or in CHCl₃ soln. (138) see indic. refs. — For formn. of \bar{C} from CO + NOCl over activated carbon at 100-250° see (139) cf. (137).]

[For formn. of \bar{C} from CO passed over heated AgCl (140)(141), over CuCl₂, PbCl₃, or NiCl₂ at 450-750° (141), over heated AuCl₃ (142), or through boilg. SbCl₃ (143), or over chlorides of Pt metals (144) see indic. refs.]

From various chlorinated hydrocarbons. From CCl₄. [For studies on formn. of C from CCl₄ (3:5100) during use of latter as fire extinguisher see (146) (84) cf. (147) (368); for patents on repression of formn. of C in such use see (148) (149) (150) cf. (368); for formn. of C from CCl₄ fire extinguishers on Mg see (151); for phosgene content of smoke from Berger mixt. (Zn + chlorohydrocarbons) see (152).]

[For form. of \bar{C} from CCl₄ with O₂ in light of 2537 Å (153) or with atomic oxygen (154) see indic. refs.]

[For formn. of C from CCl₄ by chemical oxidizing agents such as O₂ over white-hot Pt (155), air over CuCl₂ or FeCl₃ at elev. temp. (156), GeO₂ (157), chromic acid (1) (158), pyrosulfuryl chloride (1 mole) + sulfuric acid monohydrate (2 moles) on warming (158) (159) (160) (161) (162) (163) see indic. refs.]

[For formn. of \bar{C} from CCl₄ by passing with CO₂ over pumice at 350° (164), by htg. with

ZnO at 200° (164), with P_2O_5 at 200-220° for 2 days (165), or over gypsum at 900° (166), or even by htg. with a little aq. in s.t. at 250° (220) see indic. refs.]

From CHCl₃. [For an extensive account of formn. of \tilde{C} from CHCl₃ (3:5050) by oxidn. in air and light see (167). Note that such oxidn. is not effected by air in absence of light, nor by light in absence of air (168). With limited air in sunlight CHCl₃ reacts according to equation CHCl₃ + O O COCl₂ + HCl, but with excess air in sunlight in sense 2CHCl₃ + O O COCl₂ + H2O (169). Note that CHCl₃ + air over dry KOH gives some C (170). For studies on photochem. oxidn. of CHCl₃ (171) in tropical sunlight (172) including search for possible intermediate peroxides (173) (174) see indic. refs. For studies of Cl₂-sensitized photochem. oxidn. of CHCl₃ see (175) (176) (177). For oxidn of CHCl₃ by atomic oxygen see (154).]

[For formn. of \bar{C} from CHCl₃ (3:5050) by shaking with siloxen + excess O₂ (178), by action of O₃ (179) (180), by passing over CuO at 350-550° (181) or gypsum at 900° (166), with $K_2Cr_2O_7 + H_2SO_4$ (1) (158), with ClSO₃H at 120° (187), or during explosion of CHCl₃ with alkali metals (182) see indic. refs]

From Cl_2C = CCl_2 . [For form of \bar{C} from tetrachloroethylene (3:5460) during Cl_2 -sensitized photochem. oxidn. see (183) (184) (185)]

From Cl_2C =CHCl. [For form. of \tilde{C} from trichloroethylene (3:5170) with air or O_3 see (186).]

From various compounds containing the trichloromethyl group. [For formn. of \tilde{C} from trichloroacetaldehyde (chloral) (3:5210) by Cl₂-sensitized (188) or Br₂-sensitized (189) photochem. oxidn. with O₂ at 70–90°, with Cl₂ in sunlight (190), or with AlCl₃ on warming (191) see indic. refs.]

[For formn. of \tilde{C} from trichloroacetic acid (3:1150) on htg. with ZnCl₂ (192), on illuminating dry acid in pres. of air (193), or on electrolysis of aq. soln. (194) see indic. refs.; from trichloroacetyl chloride (3:5420) at 600° (195); from trichloroacetonitrile in air (196); from trichloroacetyl hydrogen peroxide on warming (200); from trichlorobromomethane + Br₂ + O₂ in light (197) see indic. refs.]

[For formn. of \tilde{C} from di-(trichloromethyl) carbonate (triphosgene) (3:1915) on distn. (198), htg. at 200° in s.t. (199), or on mixing with charcoal and htg. just above m.p. (78°) (198) see indic. refs.; from trichloromethyl chloroformate (diphosgene) (3:5515) on htg. above 300° (200) (209) or on contact with activated carbon, charcoal, or iron oxide at ord. temp. (198); from methyl trichloromethyl carbonate [Beil. III-17, III_I-(8), III₂-(15)], b.p. 57-58° at 17 mm. (204), $D_4^{17}=1.5228$ (204), $n_D^{17}=1.4487$ (204), on boilg. at ord. press. (202) or on warming with AlCl₃ (203) (204); from ethyl trichloromethyl carbonate, b.p. 78° at 19 mm. (204), $D_4^{20}=1.4205$ (204), $n_D^{20}=1.4450$ (204), or from n-propyl trichloromethyl carbonate, b.p. 93° at 12 mm. (204), $D_4^{20}=1.359$ (205), $n_-^{20}=1.4451$ (205), on warming with AlCl₃ (203); from isoamyl trichloromethyl carbonate, b.p. 120° at 23 mm. (204), $D_4^{20}=1.2644$ (204), $n_D^{20}=1.4466$ (204), phenyl trichloromethyl carbonate [Beil. VI₁-(88)], m.p. 70.5° (204), or p-tolyl trichloromethyl carbonate (206) on warming with aq. (but not with aq. NaOH) (206); from bis-(trichloromethyl) oxalate [Beil. III-17] at 350-400° (207); or from trichloromethyl perchlorate (208) see indic. refs.]

[For form. of C from trichloronitromethane (chloropicrin) [Beil. I-76, I₁-(20), I₂-(41)] in u.v. light (210), on boilg. (at 112°) under ord. press. (211), on passing with HCl over pumice at 400° (212), or on treatment with fuming H₂SO₄ (20% SO₃) at 100° (213) see indic. refs.]

From miscellaneous sources. [For formn. of \tilde{C} from $CO_2 + CCl_4$ (3:5100) + cat. at elevated temp. (225), from CS_2 with aqua regia (214) or Cl_2O (215); from COS with Cl_2 at red heat (1); from COS over fused $CuCl_2$ (1) or through boiling $SbCl_5$ (1); from thiophosgene with air or O_2 under various conditions (216); from anhydrous Na_2CO_3 with

PCl₅ (217); from pentachloropropionyl chloride (3:0470) with AlCl₃ at 60° (218); from oxalyl (di)chloride (3:5060) at 600° or with AlCl₃ in CS₂ on warming (219) see indic. refs.]

CHEMICAL BEHAVIOR OF C

Pyrolysis of \tilde{C} . \tilde{C} on heating above 300° decomposes in two ways: (1) into CO + Cl₂ (CO equilibrium) and (2) into CO₂ + CCl₄ (CO₂ equilibrium). The extent of these reactions together with the influence of various factors has been extensively studied. [For a concise summary of earlier work see the review of Dyson (11); for many important details see the original references represented by (225) (221) (222) (5) (135) (6) (223) (224).]

Photochemical decompn. of \bar{C} . [\bar{C} on exposure to short-wave u.v. light decomposes yielding (105) (226) CO + Cl₂; for more recent studies of this photochem. decompn. see (227) (228) (229) (230) (231); for application to problem of separation of isotopes of Cl₂ see (232).]

Electrolysis of C. [C or a soln. of AlCl₃ in C upon electrolysis gives (233) CO + Cl₂.]

BEHAVIOR OF C WITH INORGANIC REACTANTS

Reduction of \bar{C} . $[\bar{C} + H_2 \text{ in u.v. light at } 10^{\circ} \text{ gives CO} + \text{HCl} + \text{traces of formaldehyde} (1:0145) but at <math>80^{\circ}$ gives CO + CO₂ + CH₄ + HCl (234). $-\bar{C}$ + H₂ over Pd or Ni on pumice, or over vanadium carbide, at $300-450^{\circ}$ gives (235) cf. (236) CO + HCl + small amts. formaldehyde (1:0145) cf. (229).]

Oxidation of C. [For study of photochem. oxidn. of C see (230).]

Hydrolysis of \bar{C} . Contrary to earlier reports \bar{C} with aq. is almost instantly hydrolyzed but the rate is influenced by the manner in which contact is effected and whether the aq. is in vapor or liquid state. [For studies on the hydrol. of \bar{C} see (237) (4) (96) (238); for study of rate of hydrolysis in dioxane at 25° (239) or in toluene at 25° and at 45° (240) see indic. refs.]

Behavior of \bar{C} with metal oxides, sulfides, or phosphates. [\bar{C} with metallic oxides on htg. at 250-600° (depending upon the metal) gives the corresp. metal chloride which in some cases, e.g., FeCl₃, ThCl₄, readily sublimes in pure form; for examples of this reaction see (241) (242) (243); for use in prepn. of AlCl₃ see (249).]

[C on htg. with metal sulfides gives (246) COS [Beil. III-131, III₁-(61), III₂-(104)], b.p. -50.2° (244), f.p. -138.2° (244) (use with CdS in prepn. (245)), and the metal chloride cf. (241).]

 $[\bar{C} \text{ on htg. with certain phosphates (247) gives } CO_2 + POCl_3 + metal chloride (use in prepn. of POCl_3 (248)).]$

Analogs of \bar{C} . Carbonyl fluoride. [This compound, b.p. -83.1° (250), m.p. -114.0° (250), has been prepd. from AgF₂ + CO (250), F₂ + CO (251) cf. (250), or from acetone with F₂ (252), but has not been reported from \bar{C} . Note that \bar{C} with HF at 80° and 280 lb./sq. in. in Cu bomb gives (25-50% yield (253)) carbonyl chlorofluoride, COCIF, b.p. -42° , m.p. 138° (253).]

Carbonyl bromide. [C with BBr₃ at 150° (254) or with AlBr₃ (255) gives carbonyl bromide Beil. III-20, III₁-(9), III₂-(7)], but this prod. is better prepd. from CBr₄ by oxidn. with conc. H₂SO₄ (256) (257) (258) (for study of photochemical oxidn. see (259)); for studies of structure (26) and pyrolysis (260) (261) (262) see indic. refs.]

Carbonyl cyanide. [This compound, b.p. 65.0-65.5° (263), $D_4^{20} = 1.124$ (263), $n_2^{20} = 1.3919$ (263), has been prepd from acetone- α,α' -dicarboxylic acid (1:0485) by conversion (264) to di-isonitrosoacetone [Beil. I-806, I₂-(413)], thence to diacetyl-di-isonitrosoacetone (263), then acetoximinoacetyl cyanide (263) which was then pyrolyzed at 160-180° and

210-220 mm. (263) cf. (265). For formn. using propionyl (instead of acetyl) derivatives see (266).]

Behavior of \tilde{C} with inorganic acids. [\tilde{C} with HF as directed (250) (see analogs of \tilde{C} above) gives carbonyl chlorofluoride. — \tilde{C} with HBr does not react even at 200° (267). — \tilde{C} as liq. does not react with HI, but \tilde{C} as gas reacts with HI gas even at room temp. with sepn. of I_2 (267).]

Behavior of \tilde{C} with inorganic salts. [\tilde{C} with KI or NaI in acetone solns, gives $CO + I_2$ (use in detn. of \tilde{C} (91) (92) (93)).]

[The behavior of AlCl₃ with \bar{C} has been extensively studied; for studies of solns, of AlCl₃ in liq. \bar{C} from viewpoint of vapor pressure (268), density (269), and conductance (270) see indic. refs. — For general studies of liq. \bar{C} as solvent (271) (272) including studies on system \bar{C} + Cl₂ (273) and on phosgeno salts such as calcium phosgeno-aluminate (274) (275) and others (276) see indic. refs.]

Behavior with various inorganic nitrogen compounds. With NH_3 . [\bar{C} in lgr. (277) or C_6H_6 (278) gives urea, biuret, cyanuric acid, cyamelide, ammelide, etc.; \bar{C} as gas with NH_3 as gas gives urea (279) cf. (280) (143), guanidine, cyanuric acid (281), and cyamelide (282). — For reaction of \bar{C} in toluene soln. with aq. NH_4OH as a source of isocyanic acid see (283). — Note also that \bar{C} with sodamide reacts in cold in sense $COCl_2 + 3NaNH_2 \rightarrow NaNCO + 2NaCl + 2NH_3$, but at about 250° in sense $COCl_2 + 5NaNH_2 \rightarrow Na_2N - C = N + 2NaCl + NaOH + 3NH_3$ (284).]

[Č with NH₄Cl at elevated temps., e.g., 200–400°, gives (285) (286) carbamyl chloride, NH₂.CO.Cl [Beil. III-31, III₁-(15)], b.p. 61–62° dec. (285). — For study of analogous carbamyl fluoride and carbamyl bromide (previously unknown) see (287).]

With hydroxylamine. [For studies on behavior of C with NH₂OH see (288) (289).]

With hydrazine. [C with 1 mole hydrazine would be expected to give N-aminocarbamyl chloride, NH₂.NH.CO.Cl, but this compound appears to be unknown; C with 2 moles hydrazine should yield N,N'-diaminourea (carbohydrazide) [Beil. III-121, III₁-(57), III₂-(96)], but this compound has not been reported as prepd by this method.]

BEHAVIOR OF C WITH ORGANIC REACTANTS

With hydrocarbons. [For studies on photochem. reaction of \bar{C} with alkanes (290) or with cycloalkanes (291) or with aliphatic or alicyclic acid chlorides (292) as a means of replacement of hydrocarbon H atoms by the CO.Cl group see indic. refs. — For reaction of \bar{C} with satd. nonaromatic hydrocarbons in pres. of cat. yielding ketones see (293). — Note also that \bar{C} with $CH_4 + H_2 + CH_2$ cat. is claimed (236) to give acetaldehyde (1:0100).]

Č with aromatic hydrocarbons in pres. of a Friedel-Crafts' type cat. condenses according to conditions with either one or two moles of hydrocarbon yielding, respectively, the corresp. acid chloride or ketone. No attempt can be made here to collect the reported cases of these types since the many acid chlorides contained in this book afford numerous examples.

|C with ethylene + AlCl₃ in CS₂ adds to the unsatd. linkage giving (295) (296) (297) (298)
β-chloropropionyl chloride (3:5690) although the method has been questioned (299) (300).
- C with propylene + AlCl₃ as directed (301) gives β-chloroisobutyryl chloride (3:9101).]
|C with acetylene (302) or acetylene homologs (303) gives complex condensation products suitable for molding.

With alcohols. \bar{C} with alcohols reacts according to circumstances with either 1 mole alcohol giving the corresponding chloroformate (chlorocarbonate) esters, or with 2 moles alcohol giving the corresponding carbonate ester. The countless known cases cannot here be cited in detail but the following examples are given; see also the summary of Dyson (308).

Č with MeOH (1:6120) gives (304) methyl chloroformate (3:5075) q.v. and/or dimethyl carbonate (1:3046); Č with EtOH (1:6130) gives ethyl chloroformate (3:7295) q.v. and/or diethyl carbonate (1:3150); Č with n-PrOH (1:6150) gives n-propyl chloroformate (3:7540) q.v. and/or di-n-propyl carbonate (1:3373); Č with isopropyl alcohol (1:6135) gives isopropyl chloroformate (3:7405) q.v. and/or di-isopropyl carbonate (1:3261); Č with n-butyl alcohol (1:6180) gives n-butyl chloroformate (3:7980) q.v. and/or di-n-butyl carbonate (1:3626); Č with isobutyl alcohol (1:6165) gives isobutyl chloroformate (3:7760) q.v. and/or di-isobutyl carbonate (1:3501); Č with n-AmOH (1:6205) presumably gives n-amyl chloroformate (3:9380) q.v., but di-n-amyl carbonate appears to be unreported; Č with isoamyl alcohol (1:6200) gives isoamyl chloroformate (3:8215) q.v. and/or di-isoamyl carbonate (1:3937).

 $\ddot{\mathbf{C}}$ with allyl alcohol (1:6145) gives allyl chloroformate (3:7487) q.v. and/or diallyl carbonate; $\ddot{\mathbf{C}}$ with cyclohexanol (1:6415) gives cyclohexyl chloroformate (3:5770) q.v.; $\ddot{\mathbf{C}}$ with benzyl alcohol (1:6480) gives benzyl chloroformate (3:9565) q.v. — [For analogous reaction of $\ddot{\mathbf{C}}$ with unsatd. monohydric alcohols such as methallyl alcohol, crotyl alcohol, etc., see (305).]

 \bar{C} with monohydroxyethers gives analogous products: e.g., \bar{C} with β -methoxyethanol (1:6405) gives β -methoxyethyl chloroformate (3:9140) q.v.; \bar{C} with β -ethoxyethanol (1:6410) gives β -ethoxyethyl chloroformate (3:9280) q.v. — [For reaction of \bar{C} with polyhydroxyethers such as diethylene glycol (1:6525), triethylene glycol (1:6538), tetra-ethylene glycol, etc., giving corresp. bis-(chloroformates), see (306).]

[For study of behavior of C toward various alkali alkoxides see (307).]

[Note that \tilde{C} as liq. reacts with enol form of acetone (1:5900) in $\frac{1}{2}$ hr. at room temp. giving (330) isopropenyl chloroformate (3:7358).]

With phenols. The reaction of \bar{C} with phenols is more sluggish than with alcohols, and the corresp. diaryl carbonates are usually obtained from \bar{C} with 2 moles of the corresponding sodium phenolate cf. (308).

[\bar{C} (as liquid) with phenol (1:1420) in s.t. at 140–150° (309), or \bar{C} in toluene (310) or trichloroethylene (3:5170) (311) with aq. phenol (311) or aq. Na phenolate (310), or \bar{C} with Na phenolate in toluene (312), or \bar{C} with 10% aq. Na phenolate at 30° (313) gives (yields: 45% (312), 44% (313)) phenyl chloroformate [Beil. VI-159, VI₁-(88), VI₂-(157)], b.p. 97–98° at 25 mm. (310), 83–84° at 12 mm. (313), $n_D^{11} = 1.5180$ (313); for use as acylating agent see (314).]

[C in toluene shaken with a soln. of o-cresol (1:1400) in aq. NaOH (310) (315) gives o-tolyl chloroformate [Beil. VI-356], b.p. 119° at 35 mm. (310), 114° at 25 mm. (310). — C in toluene shaken with a soln. of m-cresol (1:1730) in aq. NaOH (315) gives m-tolyl chloroformate [Beil. VI-379], b.p. 103° at 22 mm. (315). — C in toluene shaken with a soln. of p-cresol (1:1410) in aq. NaOH (315), or C passed as gas into aq. Na p-cresolate below 10° (316), gives (78–80% yield (316)) p-tolyl chloroformate [Beil. VI-398, Vl₂-(380)], b.p. 108° at 30 mm. (315) (316).]

Countless other phenois behave with $\tilde{\mathbf{C}}$ in generally similar fashion but cannot be detailed here.

With carboxylic and sulfonic acids. Č with carboxylic acids or sulfonic acids or their salts at elevated temps, or in pres. of tertiary bases effects conversion to the corresponding carboxylic acid chlorides or sulfonyl chlorides.

[E.g., Č with AcOH (1:1010) at 110-120° (317), or at 160° over MgCl₂ on diatomaceous earth (318) cf. (319) (320), or Č with NaOAc at 120° under press. (321), or Č with Ac₂O (1:1015) + cat. (322) gives acetyl chloride (3:7065). — Č with chloroacetic acid (3:1370) over activated carbon at 200° gives (323) chloroacetyl chloride (3:5235). — Č with anhydrous oxalic acid (1:0535) in pres. of tertiary amines yields (324) oxalyl (di)chloride

(3:5060). — \bar{C} with cinnamic acid (1:0735) in pres. of tertiary amines yields (324) cinnamoyl chloride (3:0330). — \bar{C} with phenoxyacetic acid (1:0680) in pres. of tertiary amines yields (324) phenoxyacetyl chloride (3:8790). — \bar{C} with lauric acid (1:0605) at 140–150° gives (85–90% yield (325)) lauroyl chloride (3:9858). — \bar{C} with palmitic acid (1:0650) at 140–150° gives (70–75% yield (325)) palmitoyl chloride (3:9912). — \bar{C} with stearic acid (1:0660) at 140–150° gives (70–75% yield (325)) stearoyl chloride (3:9960). — \bar{C} with oleic acid (1:0565) gives (325) oleoyl chloride (3.9940).]

[\bar{C} with benzoic acid (1:0715) at 140-200° (326), or in pres. of tertiary bases or their salts (324), or \bar{C} with AgOBz in s.t. at 100° (327) gives benzoyl chloride (3:6240). — \bar{C} with salicylic acid (1:0780) in toluene (328) or in C_6H_6 in presence of tertiary bases (324) gives salicyloyl chloride (3:0085). — \bar{C} with furoic acid (1:0475) under press. at not above 100° gives (329) furoyl chloride (3:8515).]

[Many other cases including sulfonic acids, e.g., (324), cannot be detailed here.]

With amines. With primary amines. \bar{C} with primary amines reacts in various ways according to conditions to yield N-alkyl (or aryl) carbamyl chlorides, N-alkyl (or aryl) isocyanates, or N,N'-dialkyl (or aryl) ureas. Examples of these types of reaction are included below.

 $|\bar{C}|$ with CH₃NH₂.HCl at 250–300° gives (285) (331) N-methylcarbamyl chloride [Beil. IV-64]; for stabilization of this prod. by formn. of insol. compds. with AlCl₃, etc., see (332); note that treatment with CaO causes loss of HCl giving (285) methyl isocyanate [Beil. IV-77, IV₁-(337), IV₂-(578)], best prepd. by other means, e.g., from NaN₃ with Ac₂O (333) or AcCl (334) (335). — \bar{C} with CH₃NH₂ in C₆H₆ + aq. alkali, however, gives N,N'-dimethylurea [Beil. IV-65, IV₁-(331), IV₂-(568)], m.p. 106°.]

[Č with $C_2H_5NH_2$.HCl at 250-300° gives (285) N-ethylcarbamyl chloride [Beil. IV-114]; note that treatment of this prod. with CaO causes loss of HCl giving (285) ethyl isocyanate [Beil. IV-122, IV₁-(357), IV₂-(613)], b.p. 60°.]

[Č with other primary aliphatic or cycloaliphatic amine hydrochlorides under conditions such that HCl is removed from reaction mixt. gives corresp. isocyanates (336) cf. (337).]

[C with aniline hydrochloride presumably yields N-phenylcarbamyl chloride [Beil. XII-346, XII₁-(230)], m.p. 58-59°, but this compound is usually prepd. by other means (338) (339) since it readily loses HCl at 90-100° or by action of aq. or aq. alk. (340) giving phenyl isocyanate; for stabilization of N-phenylcarbamyl chloride by formn. of molecular compound with AlCl₃ see (332). — C in dry aniline (341) or aq. aniline (342) (96) gives N,N'-diphenylurea (carbanilide) [Beil. XII-352, XII₁-(233)], m.p. 238°; for use of this reaction as method of quant. detn. of C see (94) (95) cf. (91). — C with fused aniline HCl or carbanilide (343), or C with aniline HCl in C₆H₆ at 120° under press. (344) cf. (337), gives phenyl isocyanate [Beil. XII-437, XII₁-(259)], b.p. 166°.]

 \bar{C} with countless other arom. prim. amines behaves in generally similar fashion but details cannot be included here [however, for reaction of \bar{C} with p-nitroaniline in EtOAc soln. giving N-p-nitrophenylcarbamyl chloride which on recrystn. from CCl₄ loses HCl yielding p-nitrophenyl isocyanate see (345) (346) (347)].

With secondary amines. [\bar{C} with $(CH_3)_2NH$ in C_6H_6 at 0° (348) (349), or \bar{C} over fused $(CH_3)_2NH$.HCl (350) (351), gives N,N'-dimethylcarbamyl chloride [Beil. IV-73], b.p. 167°, which with dimethylamine in C_6H_6 yields (349) N,N,N',N'-tetramethylurea [Beil. IV-74, IV₁_(335), IV₂-(574)], liquid, b.p. 177°.]

[$\bar{\mathbf{C}}$ with $(\mathbf{C}_2\mathbf{H}_5)_2\mathbf{NH}$.HCl at elev. temp. (350), or with $(\mathbf{C}_2\mathbf{H}_5)_2\mathbf{NH}$ in $\mathbf{C}_6\mathbf{H}_6$ (352), gives N,N-diethylcarbamyl chloride [Beil. IV-120, IV₂-(611)], liquid, b.p. 186-190°, which with diethylamine gives (353) cf. (354) N,N,N',N'-tetraethylurea [Beil. IV-120, IV₂-(611)], liquid, b.p. 210-215°.]

[C with piperidine HCl would be expected to give N-piperidylformyl chloride ("penta-

methylenecarbamyl chloride") [Beil. XX-54], b.p. 237-238°, but this compound has been reported only by other means.]

Č with aromatic secondary amines behaves in generally analogous fashion but cannot be detailed here.

With tertiary amines. [\bar{C} with N,N-dimethylaniline at ord. temp. is claimed (355) (356) to give 4,4'-bis-(dimethylamino)benzophenone ("Michler's ketone") [Beil. XIV-89; XIV₁-(391)], m.p. 174°. However, \bar{C} passed into boilg. N,N-dimethylaniline evolves CH₂Cl (3:7005) and gives (almost quant. yield (357)) N,N'-dimethyl-N,N'-diphenylurea [Beil. XII-418, XII₁-(251)], m.p. 121° — Similarly, \bar{C} with boilg. N,N-diethylaniline evolves C₂H₅Cl (3:7015) and gives N,N'-diethyl-N,N'-diphenylurea [Beil. XII-422], m.p. 79°.]

[For use of \bar{C} in sepn. of a mixture of aniline, N-ethylaniline, and N,N-diethylaniline see (361).]

With arylhydrazines. [C in toluene added to cold ether soln of phenylhydrazine gives (358) 1,5-diphenylcarbohydrazide ("diphenylcarbazide") [Beil. XV-292, XV₁-(72)], m.p. 175-175.5° u.e. when pure (359). For use of this reaction, followed by CuSO₄ treatment of the resultant product, as a delicate test for C see (78).]

With other nutrogenous organic reactants. [For a concise review of behavior of $\bar{\mathbf{C}}$ with other nitrogenous classes such as amides, amidoximes, thioureas, thiosemicarbazides, etc., see the review of Dyson (360).]

With hexamethylenetetramine \bar{C} with hexamethylenetetramine in CHCl₃ gives (362) (363) (364) a compound of compn $\bar{C}.2C_6H_{12}N_4$, mp 187–190° dec., (363) 196–197° from MeOH (364). — [For use of hexamethylenetetramine in paints protective against \bar{C} see (365); for use of alumina or silica gels contg. hexamethylenetetramine as absorbents for \bar{C} see (366).]

B.P. 31.7° at 760 mm. (1) F.P. -122.1° (1) $D_4^{20} = 1.2129$ (1) $n_D^{20} = 1.4249$ (1)

Care must be taken to avoid confusion of \bar{C} with vinyl chloride (3:7010), with 1,2-dichloroethane (ethylene (di)chloride) (3:5130), or especially with the isomeric compounds cts-1,2-dichloroethylene (3:5042), trans-1,2-dichloroethylene (3:5028), or their ordinary mixture (3:5030).

 \bar{C} when pure is colorless liq. with mild and characteristic odor; note, however, that at temps. above 0° and especially in pres. of oxygen or other cat. \bar{C} polymerizes to a white powder insoluble in the monomeric \bar{C} . (For much further comment on polymerization see below.)

PREPARATION OF C

[For prepn. of \bar{C} from 1,1,2-trichloroethane (3:5330) by elimination of 1 HCl with alc. KOH (2) (by this process \bar{C} was initially prepared (3)), or with excess aq. Ca(OH)₂ at 70-80° (90% yield (4)) (5), or with aq. or alc. NH₃ at ord. temp. (100% yield (7)), or with Na in dry ether (36) see indic. refs.; from 1,1,1-trichloroethane (3:5085) with excess aq. Ca(OH)₂ at 70-80° see (4) (5); for formn. of \bar{C} (as by-product of the isomeric 1,2-dichloroethylenes (3:5030)) from trichloroethane by catalytic pyrolytic dehydrochlorination see (6).

[For prepn. of C from 1,1,1,2-tetrachloroethane (3:5555) by loss of HCl by actn. of aq. + Fe, Zn, or Cd on warming under reflux see (8); from 1-bromo-1,1,2-trichloroethane by loss of Br-Cl with Zn dust + boilg. alc. see (37).]

[For formn. of C (together with vinyl chloride) from ethyl trichloroacetate (3:5950) by actn. of Zn in alc. see (9).]

[For formn. of \bar{C} (20% yield) from 1,2-dichloroethane (ethylene (di)chloride (3:5130) with Cl_2 in pres. of $AlCl_3/NaCl/FeCl_3$ at 400-480° see (10); note that some 22% 1,2-dichloroethylenes (3:5030) + 29% trichloroethylene (3:5170) + 29% higher chlorination prods. are also formed.]

PURIFICATION AND STABILIZATION OF MONOMERIC C

[For purification of Č by distn. as an azeotrope with MeOH, followed by removal of the latter by extraction with aq., see (11).]

Many compds. recommended as stabilizers or polymerization inhibitors for monomeric C have been described in patents: e.g., see (12) (13) (14) (15) (16).

CHEMICAL BEHAVIOR OF MONOMERIC Č

 $\ddot{\mathbf{C}}$ + chlorine. [$\ddot{\mathbf{C}}$ with Cl₂ at 25-35° in pres. of absence of cat. adds 1 mole halogen giving (85-92% yield (17)) 1,1,1,2-tetrachloroethane (3:5555).]

 $\ddot{\mathbf{C}}$ + bromine. $\ddot{\mathbf{C}}$ with Br₂ adds 1 mole halogen yielding (18) 1,1-dichloro-1,2-dibromoethane [Beil. I-93], oil, b.p. 175° at 760 mm. decg., 65° at 13 mm., f.p. -66.85°, D_4^{25} = 2.2203, D_4^{20} = 2.2449, D_4^{15} = 2.2695, n_D^{15} = 1.55930 (18).

 $\ddot{\mathbf{C}}$ + hydrogen chloride. $\ddot{\mathbf{C}}$ with dry HCl gas at 25-35° in pres. of AlCl₃ or FeCl₃ adds 1 mole HCl giving (85-90% yields (19) (20)) 1,1,1-trichloroethane (3:5085).

 $\ddot{\mathbf{C}}$ + hydrogen bromide. The addition to $\ddot{\mathbf{C}}$ of HBr appears to be unreported.

Polymerization of Č. Polymerization of Č either with itself or with other cpds. (especially other substituted ethylene derivs.) leads to a large group of industrially important materials broadly designated as "vinylidene polymers." Certain plasticized and stabilized copolymer compositions have been named "Saran." [For extremely valuable comprehensive reviews of this general field see (1) (21) (22); in view of the comprehensive surveys and prior literature (including patents) references given (especially in (1)), the following text will in general include only citations since 1942.]

 \bar{C} when carefully purified and free from oxygen polymerizes only very slowly; however, in the pres. of various catalysts, notably peroxides, polymerization readily occurs (for amplification see {1}).

[For patents involving polymeric \bar{C} from viewpoint of purification (23), storage of supercooled material (24), heat treatment to increase tensile strength (25), improvement of stability to light and heat (26) (27) (28) (29), or coloring (30) see indic. refs. — For studies on structure of fibers of polymeric \bar{C} see (1) (31). — For identification of common comml. plastics (including "Saran" and "Velon") see (32).]

[For review of copolymerization of \bar{C} see (1); for copolymerization with butadiene (33), with vinyl chloride or vinyl acetate (34), with styrene, acrylonitrile, various methacrylates, etc. (35), see indic. refs.]

B.P. F.P. 32-33° at 748 mm. (1) (2) (3)
$$-66$$
 to -64.2 ° (1) $D_4^{20} = 1.261$ (9) $n_D^{20} = 1.42790$ (9)

Colorless oil which ignites in air and explodes even on stirring; however, its 5-10% soln. in ether is safely handled (4).

[For prepn. of \bar{C} from acetylene + aq. alk. KOCl soln. under N₂ see (1) (2) (3); from 1,1,2-trichloroethylene (3:5170) in N₂ at 130° over solid granular KOH (65% yield (4)) see (4) (5) (9); from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) with KOH in xylene under N₂ (can be carried out as a lect. expt.) see (6) (9); for formn. of \bar{C} from barium salt of α,β,β -trichloroacrylic acid (3:1840) by htg. in H₂ see (13).]

 $\bar{\mathbf{C}}$ forms with diethyl ether a molecular cpd., $\bar{\mathbf{C}}.\bar{\mathbf{C}}_4\mathbf{H}_6\mathbf{O}$, eas. decomposed by aq. into its components (5); for D and n of ether solns. of $\bar{\mathbf{C}}$ see (9).

C on combusion yields CO, CO₂, COCl₂ (4) together with other products (5).

[For use of C in extraction of coffee see (7).]

 \bar{C} in CCl₄ treated 9 hrs. with strong Cl₂/CCl₄ soln. gives (1) on evapn. hexachloroethane (3:4835), m.p. 187° in s.t. (1).

 \bar{C} on passing into Br₂/aq. yields (1) a heavy oil which on stdg. under the excess reagt. solidifies to cryst. of 1,2-dichloro-1,1,2,2-dibromoethane; after recrystn. from alc., m.p. 209-210° dec., with yellowing at 200° (1). [Note that \bar{C} in CCl₄ treated with Br₂/CCl₄ can add 1 mole Br₂ giving (65% yield (4)) 1,2-dichloro-1,2-dibromoethylene, b.p. 172° at 760 mm. (8), $D_1^{45} = 2.3036$ (8), $n_1^{15} = 1.57984$ (8), m.p. +4.40° (8), 4.9° (4).]

C with I₂ in ether (4) or CCl₄ (5) gives slowly 1,2-dichloro-1,2-dicodoethylene, cryst. from ether or pet. eth., m.p. 70° (4). [Another stereoisomer, m.p. 5-7°, is formed only to extent of 10% and is removed by the solvent (5).]

[For studies on behavior of Č on polymerization (10), and its reactions with NH₃ (10), amines (10) (11), alcoholates (10), diethyl sodio-malonate (10), organic Mg compds. (12), ethyl diazoacetate (12), and NO₂ (12) see indic. refs.]

  Note 1. For study of vap.
                                                           D_4^0 = 1.3620
  press. of \bar{C} over range -87^{\circ}
                                                                                n_{\rm D}^0 = 1.4361 (23)
  to +38^{\circ} see (7).
                                                           For D_4^t over range
                                                           t = -100^{\circ} \text{ to } +40^{\circ}
                                                           see (25); -273 to
                                                           -194° see (10).
```

MISCELLANEOUS PHYSICAL PROPERTIES OF C

VARIOUS SOLUBILITY RELATIONS

With water. $ildе{C}$ is only slightly soluble in aq. and readily volatile with steam. E.g., 100 g. water dissolves following amts. of $ildе{C}$: 2.363 g. at 0° (27), 2.122 g. at 10° (27), 2.000 g. at 20° (27) (15), 1.969 g. at 30° (27). — For study of soly. of water in $ildе{C}$ at 0°, 25°, and 30° see (28) (29); for study of reciprocal soly. of $ildе{C}$ and water see (30) (68). — $ildе{C}$ with H₂O is claimed (35) to form a hydrate stable up to +2°.

With organic compounds. [For studies on soly. of \bar{C} in 35 org. solvents of various types see (31); for soly. of \bar{C} in cellosolve acetate (33), carbitol acetate (32) (33), diethylene glycol diethyl ether (32), tetraethylene glycol dimethyl ether (32), and tetraethylene glycol diethyl ether (33) see indic. refs.]

(4).

BINARY SYSTEMS CONTAINING C (See also azeotropes containing C)

 $C + Cl_2$: for f.p./compn. data and diagram (various compounds and eutectics are formed) see (21).

 $\bar{C} + C_2 H_5 Cl$ (3:7015); for f.p./compn. data and diag. (eutectic, f.p. -149.7°, conts. 31.7 wt. % \ddot{C}) see (17). — \ddot{C} + $CHCl_3$ (3:5050): for f.p./compn. data and diag. (eutectic, f.p. -108.4° , conts. 70.5 wt. % \bar{C}) see (17); for data on b.p., D_4^{20} , and liq./vapor equilibria see (34). $-\bar{C} + CCl_4$ (3:5100): for data on b.p., D_4^{20} , and liq./vapor equilibria see (34). $-\bar{C}$ $ar{C}+1$,1,-dichloroethane (3:5035): for f.p./compn. data see (19). — $ar{C}+2$,2-dichloropropane (3:7140): for f.p./compn. data see (22).

C + isobutyl bromide: for f.p./compn. data see (19). — C + methylene (di)bromide: for f.p./compn. data see (19).

 \ddot{C} + methylene (di)iodide: for f.p./compn. data see (19).

 \bar{C} + dimethylaniline: for D_4^{25} and $n_D^{24.8}$ for 0-100% \bar{C} see (23); for f.p./compn. data and diagram (eutectic, m.p. -97.2° , conts. 91 wt % \overline{C}) see (168).

TERNARY SYSTEMS CONTAINING C (See also azeotropes containing C)

 $\ddot{C} + CHCl_3 + CCl_4$: system forms ternary eutectic, f.p. -111.4°, contg. 60 wt. % \ddot{C} + 27.0 wt. % CHCl₃ (3:5050) + 13.0 wt. % CCl₄ (3:5100) (17).

BINARY AZEOTROPES CONTAINING C

 $\vec{C} + H_2O$: \vec{C} forms with aq. a const.-boilg. mixt., b.p. 38.1°, contg. 98.5 wt. % \vec{C} (68). $\overline{C} + MeOH$: \overline{C} forms with MeOH (1:6120) a const.-boilg. mixt., b.p. 39.2° (4) at 760 mm. (3), contg. 92 wt. % (3), 94 wt. % (4) \ddot{C} . $-\ddot{C}$ + EtOH: \ddot{C} forms with EtOH (1:6130) a const.-boilg. mixt., b.p. 41.0° at 760 mm. (3), contg. 96.5 wt. % (3) C. — C forms with formaldehyde dimethylacetal (1:0105) a const.-boilg. mixt., b.p. 45.0° (36), contg. (36) 41 wt. % \bar{C} , cf. (37). — \bar{C} + acetone: note that this system forms no azeotrope; note also that C is the only known liquid which with MeOH (see above) gives a const.-boilg. mixt.

boilg. lower than acetone and at the same time not forming a binary azeotrope with acetone TERNARY AZEOTROPES CONTAINING Č

 $C + H_2O + EtOH$: forms no ternary azeotrope (68).

C + MeOH + acetone: this system forms no ternary azeotrope; for discussion see (4) (38).

 $\bar{C} + CHCl_8 + acetone$: for discussion see (4).

OTHER PHYSICAL PROPERTIES OF C

[For study of thermal conductivity of C see (39); for studies of heat capacity of C (40) as calculated from spectroscopic data (41) see indic. refs.; for studies of critical temp. of C (7) (15) (6) and method for its microdetermination (6) see indic. refs.; for ebullioscopic const., viz., 2.6° for 1000 g. Č, see (43).]

[For studies of adsorption of C on wood charcoal at 25° and 50° (44) or on cocoanut charcoal over range -31.5° to 184° (45), on Al(OH)₈ gel (46), on Fe(OH)₃ gel (47), on Cr₂O₃ (48) see indic. refs.; Č is preferentially adsorbed (42) by silica gel from its mixt. with CHCl₃ (3:5050).]

[For study of attempt to separate isotopes of Cl₂ by reversible fractional distn. of Č see (49).]

PHYSIOLOGICAL ASPECTS OF C

 \tilde{C} has low toxicity compared to other chlorinated hydrocarbon solvents; the maximum allowable conc. for 8 hrs. daily exposure is 500 p.p.m. (50). [For study of relative toxicity of \tilde{C} see (51); for extensive study of industrial hygiene and toxicity of \tilde{C} (together with 12 other chlorinated solvents (52)) (53) (50) see indic. refs.; for study of \tilde{C} upon running activity of male rat see (54).]

USES OF C

Č is widely used as a solvent, as a fluid for refrigeration processes, and for removing water from other organic materials; examples of all these aspects are cited below.

[For study of utility of \bar{C} as solvent for the ozonization of org. compds. see (10); for use of \bar{C} as solvent for the extraction of vitamin A (55) or of soy-bean oil (56) see indic. refs.; for general studies (15) (57) (58) and patents (59) (60) (61) (62) (63) (64) (65) on use of \bar{C} in refrigerating machines and systems see indic. refs.; for use of \bar{C} in detn. of water content of liquids (66) (67) or for prepn. of abs. EtOH (68) (69) (70) see indic. refs.]

DETECTION OR DETERMINATION OF C

[For detection of \bar{C} in pres. of acetone (by means of Fujiwara color test with pyridine + NaOH) see (71); for distinction of \bar{C} from CHCl₃ (3:5050) and from CCl₄ (3:5100) by color tests see (72) (73) (also under \bigcirc below).]

[For detn. of \bar{C} in blood by removal through aeration, pyrolytic decompn. of \bar{C} , and alk. absorption of resultant HCl as directed see (74); for detn. of C, H, and Cl in \bar{C} by combustion see (75). Note that the R. + H. Tri-Per Analyzer, a recording ultra-violet photometer very useful for detn. of trichloroethylene (3:5170) and tetrachloroethylene (3:5460), is insensitive (76) to \bar{C} .]

PREPARATION OR FORMATION OF C

From methane. [The chlorination of CH₄ under various conditions to yield $\bar{\mathbf{C}}$ (accompanied by more or less CH₃Cl (3:7005), CHCl₃ (3:5050), and CCl₄ (3:5100)) has been extensively studied and no attempt will be made here to sift out details. For examples of leading scientific papers ((77)–(88), incl.) and patents ((89)–(96), incl.) see indic. refs.]

From methyl chloride. [The chlorination of MeCl to \bar{C} has also been extensively studied; many of the relevant data are included in the papers and patents on the chlorination of methane (see preceding paragraph), to which should be added the following patents (91) (97) (98) (99) (100). Note patent (98) on separation of MeCl (3:7005) from \bar{C} by hydrolysis of former to MeOH (1:6120) with Ca(OH)₂ under press.]

From chloroform. [For formn. of \bar{C} from CHCl₃ (3:5050) by replacement of 1 chlorine by hydrogen using Zn + alc. HCl (101), Zn + AcOH (103), Zn dust + alc. NH₃ (102) (8) (2), Al/Hg + aq. (103), Fe + AcOH (103), or Si₃H₈ + AlCl₃ in absence of air (104) see indic. refs.]

From carbon tetrachloride. [For prepn. of C from CCl₄ (3:5100) using aq. FeSO₄ + NaOH see (105).]

From miscellaneous sources. [For prepn. or formn. of \bar{C} from CH_2I_2 with Cl_2 (first prepn. of \bar{C}) (106) cf. (158); from polyoxymethylene with PCl_5 in s.t. (107); from MeOH + S_2Cl_2 + Cl_2 (108); or from chloroacetic acid (3:1370) by electrochem. oxidn. (109) see indic. refs.]

CHEMICAL BEHAVIOR OF C

Oxidation of \tilde{C} . [\tilde{C} with air at ord. temps. and press. does not give inflammable mixts.; at high temps. vapor of \tilde{C} becomes inflammable and ignites at 642° in air, at 606° in O_2 ;

limiting concns. of \bar{C} for inflammability in O_2 are 15.5-66.4%; N_2 does not greatly affect the lower limit of inflammability in O_2 but greatly reduces the upper limit (110). — For study of inflammability of mixts. of \bar{C} with O_2+,N_2 , air + CO, or O_2+N_2+ MeBr see (111). — For effect of \bar{C} on flash point of solvents see (115).]

[C with atomic O gives (112) COCl₂ (3:5000), Cl₂, HCl, CO₂ + H₂O; C with air over CuO at 450° gives (113) little COCl₂ (3:5000); for study of Cl₂-sensitized photochem. oxidn. of C see (114).]

Fluorination of \tilde{C} . [\tilde{C} with SbF₃ + cat. readily gives (126) (127) CH₂F₂, b.p. -51.6°, + CH₂ClF, b.p. -9.0°.]

Chlorination of \tilde{C} . [\tilde{C} with Cl_2 as directed (116) (117), or \tilde{C} with HCl gas + air over CuCl₂ at 440° (118), gives CHCl₃ (3:5050) and CCl₄ (3:5100).]

Bromination of \tilde{C} . [\tilde{C} with Br₂ cf. (158) in pres. of Al gives (128) cf. (129) CH₂BrCl + CH₂Br₂ [Beil. I-67, I₁-(16), I₂-(32)], b.p. 96.95° at 760 mm., f.p. -52.7°, $D_4^{25} = 2.48417$, $D_4^{20} = 2.49702$ (130). — For an alternative synthesis of CH₂Br₂ (88–90% yield) from CHBr₃ with Na₃AsO₃ + NaOH see (138).]

Hydrolysis of \bar{C} . \bar{C} on suitable hydrolysis yields formaldehyde (1:0145). [E.g., \bar{C} with aq. in pres. of weakly alk. reacting salts such as NaHCO₃, Na₂HPO₄, NaOAc, etc., at 165° under press. (119), or $\bar{C} + N_2$ over dry Na₂CO₃ at 310-320° (120), \bar{C} with steam over activated carbon at 260-270° (121), \bar{C} with aq. at 140-170° under press. (122), \bar{C} with steam at 550-850° over cat. (123), or \bar{C} with steam over tin phosphate at 460° (124) gives formaldehyde (1:0145) + HCl. Note that \bar{C} on protracted htg. with aq. at 180° gives (125) formic acid (1:1005), MeCl (3:7005), MeOH (1:6120) HCl + CO.]

Behavior with inorganic salts. [C with NaI in acetone htd. in press. bottle for 20 hrs. as directed (131), or \tilde{C} with NaI in acetone, McOH, or EtOH at 120–130° under press. (132), gives (60% yield (131)) methylene (d1)iodide [Beil. I-71, I₁–(18), I₂–(37)], b.p. 151–153° cor. at 330 mm. (133), 88° at 39 mm. (134), 66–67° at 11–12 mm. (24); exists in two crystn. forms, stable form, m.p. + 5.85° (135), metastable form, m.p. 40° (136); $D_4^{25} = 3.3078$ (130); $D_4^{20} = 3.3212$ (130); $D_4^{15} = 3.3345$ (130); $n_D^{15} = 1.74428$ (130). — For an alternative synthesis of CH₂I₂ (90–97% yield) from iodoform by treatment with Na₃AsO₃ + NaOH see (137).]

[Č with 2 moles K₂SO₃ in aq. at 150-160° under press. gives (85% yield (139)) the dipotassium salt of methanedisulfonic acid (methionic acid) [Beil. I-579, I₁-(303), I₂-(644)] [Č with alc. AgNO₃ does *not* react even on stdg. for several days; note that while neither CHCl₃ (3:5050) nor CCl₄ (3:5100) reacts either, CH₃Cl (3:7005) gives a ppt. within 3 hrs. (140).]

[For form. of polymeric prods. from reaction of \bar{C} with metal sulfides or polysulfides see (141); for study of photochem. reaction of \bar{C} with H₂S see (149).]

Behavior with metals. \bar{C} (like many other polyhalogenated hydrocarbons) in presence of metallic K, Na, K/Na alloy, or even of certain other active metals explodes under the influence of mechanical or thermal shock. [For study of this characteristic (142), especially with regard to sensitivity toward Li, Na, K, Ca, Sr, Ba (143), see indic. refs.]

[Note that \bar{C} with molten sodium at 260-300° gives (144) C, H, and CH₄, together with smaller amts. of ethane, ethylene, and acetylene; note that \bar{C} with Na vapor in pres. of H₂ gives (145) 92% CH₄ + 8% ethylene, while \bar{C} with Na vapor in N₂ gives (145) almost 100% ethylene; for further studies of behavior of \bar{C} with Na vapor see (146) (147). Note that attempts to obtain a free methylene radical (CH₂) with \bar{C} + Na vapor have been unsuccessful (148).]

[For study of stability of various metals with respect to corrosion by \bar{C} under various conditions see (15).]

Behavior with various organic reactants. [C with CO + AlCl₃ at 260° and 800 atm. press. for 8 hrs. gives (150) chloroacetyl chloride (3:5235); but C with CO, COS, or COCl₂ (3:5000) + cat. at 700° gives (151) malonyl (di)chloride (3:9030).]

[$\bar{\mathbf{C}}$ with $\mathbf{C}_6\mathbf{H}_6$ + AlCl₃ gives (152) cf. (153) diphenylmethane (1:7120); $\bar{\mathbf{C}}$ with toluene + AlCl₃ gives (152) di-p-tolylmethane [Beil. V-615, V₁-(289), V₂-(518)], m.p. 28° (154), b.p. 302° cor. at 768 mm. (154), accompanied by considerable (152) (155) 2,7-dimethylanthracene, m.p. 241° cor. (155); $\bar{\mathbf{C}}$ with o-xylene (1:7430) + AlCl₃ in acetylene tetrachloride (3:5750) as solvent gives (156) 2,3,6,7-tetramethylanthracene, m.p. 299° (156); for behavior of $\bar{\mathbf{C}}$ in pres. of AlCl₃ with m-xylene (1:7420) or with pseudocumene (1:7470) see (152).]

[$\bar{\rm C}$ with CH₂Br₂ + 5-10% KCl in pres. of moistened AlCl₃ at 180° in s.t. for 16 hrs. undergoes a redistribution reaction giving (157) a mixt. contg. 33% $\bar{\rm C}$ + 18% CH₂Br₂ + 50% ClCH₂Br; $\bar{\rm C}$ with CH₂I₂ similarly treated at 114° for 18 hrs. gives (157) a mixt. contg. 33% $\bar{\rm C}$ + 21% CH₂I₂ + 46% ClCH₂I.]

[\tilde{C} with NaOMe in s.t. at 100° (158), or vapor of \tilde{C} over NaOMe + pumice at 200° (37), gives formaldehyde dimethylacetal (1:0105); \tilde{C} + NaOEt in s.t. at 100° (158), or \tilde{C} with excess EtOH + calcd. amt. NaOH at 100-125° under press. (159), gives formaldehyde diethylacetal (1:0135); for analogous behavior of other alcoholates (158) (159) or phenolates (158) see indic. refs.]

[\tilde{C} with alc. NH₃ at 125° in s.t. gives (160) hexamethylenetetramine [Beil. I-583, I₁-(306)]. — \tilde{C} with Me₂NH in s.t. at 70° gives (161) bis-(dimethylamino)methane. — \tilde{C} with Me₃N in 90% acctone at 55° or more slowly in ether undergoes a quaternization reaction giving trimethyl-chloromethyl-ammonium chloride (constants not detd.) (162).]

- P Beilstein test for halogen. Note that because of its low b.p. C often appears to fail in Beilstein copper gauze test for halogen compds.; in such cases use the modification described by (163) (164).
- P Hydrolysis to formaldehyde. C (2 g.) in 10% MeOH/alk. (20 ml.) boiled 20 min. under good reflux, subsequently acidified with dil. H₂SO₄, gives soln. containg. Cl and formaldehyde (1:0145).
- ② Color reaction with α-naphthol/cyclohexanol. C

 (1 drop) with 2 ml. of a 2% soln. of α-naphthol (1:1500) in cyclohexanol (1:6415) + 1 pellet of solid NaOH, boiled 25 seconds and cooled, gives (72) blue color; one portion of this blue soln. underlaid with equal volume 85% H₂SO₄, stood 1 minute and shaken, turns green-blue; a second portion of the alkaline blue soln. acidified with equal volume of AcOH (1:1010) stood 1 minute and shaken becomes yellow. [Note that the alkaline boiling also gives a blue color with CHCl₃ (3:5050) and with CCl₄ (3:5100) while other chlorinated solvents (72) give yellow-brown, gray, or brown; in the H₂SO₄ acidification both CHCl₃ and CCl₄ give blue rather than green-blue; in the AcOH acidification CHCl₃ gives an orange-yellow, CCl₄ a red color.]
- P Color test with 2,7-dihydroxynaphthalene/cyclohexanol. C (1 drop) with 2 ml. pure cyclohexanol (1:6415) + 1 pellet NaOH + a few mgms. 2,7-dihydroxynaphthalene htd. at 197° (b.p. of ethylene glycol) for 45 seconds, decanted from undissolved NaOH, cooled, and shaken with 2 ml. AcOH + 4 ml. 96% EtOH, gives steel-blue color (73). [Note that under these conditions CHCl₃ (3:5050) gives a deep-red color while CCl₄ (3:5100) gives a pale yellow brown.]
- Color test with cyclopentanol. Č (1 drop) in cyclopentanol (1 ml.) with 1 pellet NaOH boiled 25 seconds, then shaken vigorously for 35 seconds, gives deep red color; upon addition of 4 ml. 96% EtOH and shaking color intensifies or becomes reddish brown (73). [Note that after addn. of alc. CHCl3 gives only a pale citron-yellow or

yellowish brown and that as little as 20% of \bar{C} can be detected by this means in CHCl₃ (73); CCl₄ gives (73) after addn. of alc. an intense nut-brown.]

Formaldehyde di- α -naphthylacetal (methylene di- α -naphthyl ether): unreported. Formaldehyde di- β -naphthylacetal (methylene di- β -naphthyl ether): m.p. 134° (165), 133-134° (166). [From CH₂I₂ with Na β -naphtholate refluxed in alc. (165) (166) (167); not actually reported from \bar{C} but presumably resulting by above method if some KI be added to refluxing mixture of \bar{C} + Na β -naphtholate in acetone. Note that this ether fails (165) (167) to form any PkOH addition compound.]

3:5025 1,1,3-TRICHLORO-2-METHYLPROPENE-1 $C_4H_5Cl_3$ Beil. S.N. 11 CH₂ ClCH₂—C=CCl₂

B.P. 45-46° (1)

Note: C readily undergoes allyl transposition so that in reactions of C products derived from the isomeric 1,1,1-trichloro-2-methylpropene-2 (3:5605) may be expected (1) (2) (3) [For prepn. of \bar{C} (57% yield (1)) from β,β,β -trichloro-ter-butyl alc. ("Chloretone") (3:2662) by htg. to 200° with P2O5 and dimethylaniline see (1).] [A 15% yield of the isomeric 1,1,1-trichloro-2-methylpropene-2 (3:5605) together with some α -chloroisobutyric acid (3:0235) are separated from \bar{C} by redistillation (1).

C on hydrolysis by boilg. 2 days with AgOH at 100° under pressure gives (22% yield (2)) 3,3-dichloro-2-methylpropen-2-ol-1, b.p. 78-79°, $D_{-}^{20} = 1.298$, $n_{-}^{20} = 1.493$. [The corresp. ether, b.p. 129° at 11 mm., $D_{-}^{20} = 1.330$, $n_{-}^{20} = 1.5108$, is also formed in 22% yield (2).] The alc. may be characterized by its p-nitrobenzoate, m.p. 91°, or its N-phenylcarbamate, m.p. 64° (2).

 $\bar{\mathbf{C}}$ on htg. with NaOAc + AcOH gives (2) 3,3-dichloro-2-methylpropen-2-yl acetate, b.p. 79° at 12 mm., $D_{-}^{20} = 1.257$, $n_{-}^{20} = 1.4718$ (2). [With boilg. NaOH this ester regenerates the corresp. alc. (2).]

 \bar{C} with NaOEt gives in the cold 70% yield (2) of 3,3-dichloro-2-methylpropen-2-yl ethyl ether, b.p. 56° at 12 mm., $D_{-}^{20} = 1.1285$, $n_{-}^{20} = 1.4610$ (2).

 \bar{C} in CHCl₃, treated with O₃, then hydrolyzed gives α -chloroacetone (3:5425), b.p. 60-62° at 50 mm. (1).

[For reactns. of C with CaI2 and with CH3MgBr see (2).]

- D 1,1,1,2,3-Pentachloro-2-methylpropane (3·1265): m.p. 59.5° (2). [From $\ddot{\textbf{C}}$ by direct treatment with Cl₂ (2).]
- (2). [From C on warming 1 day with excess Br₂, then distg. at 12 mm. (2).]
- 3,3-Dichloro-2-methylpropen-2-yl p-nitrobenzoate: m.p. 91° (2). [From C on boilg. with dil. alc. soln. of K p-nitrobenzoate (2).]

See also both cis-1,2-dichloroethylene (3:5042) and ordinary (mixt. of cis and trans) 1,2-dichloroethylene (3:5030); the following text is restricted to studies on substantially pure trans stereoisomer.

Note carefully that 1,2-dichloroethylene is not the same as ethylene (di)chloride (3:5130) (there are an almost incredible number of errors in the literature involving this point); neither is it the same as the now very important 1,1-dichloroethylene (vinylidene (di)chloride) (3:5005).

GENERAL DATA ON C

Note that substantially pure \bar{C} is comml. solvent in U.S.A. under designation "Di 48" (referring to the two chlorine atoms and the b.p.). [For study of thermal conductivity and for tabulation of constants of comml. \bar{C} see (14). — For toxicity of \bar{C} see (36) (15). — For use of \bar{C} in extraction of caffeine from coffee see (16).]

[For data on vap. press. of C over range 23-48.8° see (1).]

Binary systems contg. $\bar{\mathbf{C}}$. (See also below under azeotropes.) — $[\bar{\mathbf{C}} + cis-1,2\text{-dichloro-ethylene} (3:5042);$ for use of n_D^{25} in detn. of compn. of mixt. see (7); for f.p./compn. data (eutectic, f.p. -91° contg. about 29% $\bar{\mathbf{C}}$) see (12). — For f.p./compn. data on binary systems $\bar{\mathbf{C}}$ + ethylene dichloride (3:5130), $\bar{\mathbf{C}}$ + 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750), or $\bar{\mathbf{C}}$ + ethylene dibromide see (12). — For f.p./compn. data on system $\bar{\mathbf{C}}$ + $\mathbf{C}_6\mathbf{H}_6$ (1:7400) see (34). — For study of soly. of various other cis-trans isomers in $\bar{\mathbf{C}}$ see (5).]

Azeotropes contg. Č. Binary azeotropes. Č with aq. forms a const.-boilg. mixt., b.p. 45.3°, contg. 98.1% Č (38) (39). — Č with EtOH (1:6130) forms a const.-boilg. mixt., b.p. 46.5° at 760 mm. (17) (38) (39), contg. 94.5% (38) (39) 88.2 mole % (17) Č.

Ternary azeotropes. \tilde{C} with EtOH (1:6130) + aq. forms a const.-boilg. mixt., b.p. 44.4°, contg. 94.5% \tilde{C} + 4.4% EtOH + 1.1% aq. (38) (39).

PREPARATION OF C

Pure \tilde{C} is usually obtd. by careful fractional distillation at ord. press. of the mixt. of the cis and trans stereoisomers comprising ord. 1,2-dichloroethylene (3:5030) [for brief comments on this mode of sepn. see (1) (2) (3) (5) (6) (7) (8) (9) (11); note that some workers (11) recommend distn. in atmosphere of CO_2 . — For detn. of % compn. of mixts. of \tilde{C} with its stereoisomer by means of $n_2^{D_5}$ see (7); by means of dielectric constant see (7) (19).] [For study of possibility of sepn. of \tilde{C} from its stereoisomer by differential adsorption

[For study of possibility of sepn. of C from its stereoisomer by differential adsorption on silica gel see (18).]

[For prepn. of \tilde{C} from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) by splitting out 2 adjacent chlorine atoms with Zn + EtOH (followed by fractionation of crude \tilde{C}) see (19); for prepn. of \tilde{C} from 3,4-dichloro-2-methylbuten-3-ol-2 by slow addn. to 85% KOH at 175-180° (acetone is also formed) see (37).]

[For patents on prepn. of almost pure \bar{C} from acetylene with Cl_2 by controlled reaction over pumice contg. $CuCl_2$ at 200–240° (20) or over activated carbon at 40° (21) see indic. refs.]

ISOMERIZATION OF C

 $\bar{\rm C}$ under the influence of heat, light, or various catalysts in part isomerizes to cis-1,2-dichloroethylene (3:5042). — [For study of thermal isomerization of $\bar{\rm C}$ in vapor phase at 185–275° (22), up to 350° (19), up to 975° (23), in liq. phase or in various solns. (11) see indic. refs.; note that the equilibrium mixt. at 300° conts. 39.2 \pm 0.7% $\bar{\rm C}$, at 350° conts. 40.6 \pm 0.3% $\bar{\rm C}$ (19), at 975° conts. 47.7% $\bar{\rm C}$ (23). — For study of kinetics of thermal isomerization of $\bar{\rm C}$ see (7) (24).]

[For patent on isomerization of pure \tilde{C} to a mixt. contg. 65-70% of the *cis* stereoisomer (3:5042) by means of a small amt. Br₂ at 30° or above in pres. of cat. or in vapor phase at not over 300° see (25) cf. (7). — For patent on thermal isomerization of \tilde{C} see (26).]

CHEMICAL BEHAVIOR OF C

Reactions with inorganic compds. \tilde{C} (in vapor phase at 80–95° in light of 4360 Å (27)) with Cl_2 adds 1 mole halogen yielding 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750).

Č with Br₂ in light adds 1 mole halogen yielding (28) (3) (29) 1,2-dibromo-1,2-dichloro-ethane [Beil. I-93, I₂-(29), I₂-(64)], b.p. 195° at 760 mm. (13) (30), b.p. 79.0-79.5° at 15 mm. (3). — [For extensive study of the resultant equilibrium see (28); for study of influence of O₂ and other factors see (28); for study of kinetics in CCl₄ soln. see (31) (32).

— Note that rate of addn. of Br_2 either directly or in CCl₄ soln. is twice as great for \tilde{C} as for the stereoisomeric cis form (3:5042) (3).]

[\bar{C} with alc. KOH splits out 1 HCl yielding chloroacetylene (3:7000); note, however, that rate of reactn. with \bar{C} is only about $\frac{1}{20}$ as fast as for its cis stereoisomer (3:5042) (3).]

 \bar{C} with aq. NaOH/Hg(CN)₂ behaves quite differently from its *cis* stereoisomer (3:5042): on shaking at room temp. with specified (8) concns. of reagt. \bar{C} shows signs of reactn. only after 3 hrs. (instead of $\frac{1}{2}$ hr. as for the stereoisomer) and suffers replacement of 1 H atom per mole by mercury forming mercury *bis*-(α , β -dichloroethylenide) Hg(CCl = CHCl)₂, m.p. 50.3°, insol. aq., but very sol. CHCl₃, ether, or acetone, together with other, more complex derivatives. — Cf. the entirely different behavior of the *cis* stereoisomer (3:5042).

Č with PtCl₄ in C₆H₆ at 40-50° for 3 hrs. evolves HCl and on cooling separates amber cryst. of trans-1,2-dichloroethylene platinous chloride, Cl.CH = CH.Cl.PtCl₂, m.p. 155-160° (33); note that the cis stereoisomer by similar treatment gives only gums (33).

Reactions with organic compds. [\bar{C} with C_6H_6+Al/Hg at 0° gives same prods. as does the ord. (mixture) 1,2-dichlorocthylene (3:5030) (presumably indicating partial isomerization of \bar{C}); these prods. include dibenzyl, triphenylethane, tetraphenylethane, etc. (6).]

3:5030 1,2-DICHLOROETHYLENE ord.
$$C_2H_2Cl_2$$
 Beil. I - 187 (Acetylene dichloride) mixt. $HC-Cl + Cl-C-H + Cl$ $I_1-(77)$ $I_2-(158)$ $HC-Cl + H-C-Cl$ $Cis trans$ (3:5042) (3:5028)

The text under this heading refers to the ordinary mixt. of the two individual stereoisomeric forms, viz., cis-1,2-dichloroethylene (3:5042) and trans-1,2-dichloroethylene (3:5028). Since the proportion of the two stereoisomers differs according to conditions and previous treatment no definite physical constants can be given, and those for each pure stereoisomer should be consulted.

Note carefully that 1,2-dichloroethylene is *not* the same as ethylene (di)chloride (3:5130) (there are an almost incredible number of errors in the literature involving this point); neither is it the same as 1,1-dichloroethylene (vinylidene (di)chloride) (3:5005).

Furthermore note that some confusion exists in the literature on the relationship between the two isomers; the high-boilg. stereoisomer (3:5042) is now definitely regarded as the cis form and the lower-boilg. stereoisomer (3:5028) as the trans; however, some records (including "International Critical Tables") have inverted these designations.

PHYSICAL DATA ON Č

General. Ordinary comml. \bar{C} consists of a mixt. of the two stereoisomers; by careful fractional distn. the two stereoisomers can be separated (for references see text of the two pure stereoisomers). — An equilibrium mixt. contg. about 20% of the lower-boilg. (trans) (3:5028) and 80% of the higher-boilg. (cis) (3:5042) forms can be obtd. from either by treatment at ord. temp. in sunlight with 1-2% Br₂ (for data on thermal isomerization see text of both individual stereoisomers). — Note also that the two pure stereoisomers (q.v.) form a eutectic. f.p. -91° , contg. about 29% trans +71% cis forms.

Solubility relationships of \tilde{C} . Soly, of \tilde{C} in aq. is 0.8 ml. per 100 ml. aq. at ord, temp. (1). — [For soly, of I_2 in \tilde{C} over range $11-25^\circ$ (2) and use of such solns, in detn. I_2 number of oils and fats (3) (4) see indic. refs. — For solv, power of \tilde{C} for various org. epds. see (5) (6).

Inflammability of \bar{C} . \bar{C} with air forms explosive mixt. in range contg. 3.3–15.3% \bar{C} (7); 9.7–12.8% \bar{C} (8). [For studies of influence of vapors of \bar{C} on mixts. of air with CH₄ (8), acetylene (10), CO (10) (12), or H₂ (10) see indic. refs.]

Miscellaneous data. [Ebullioscopic const. of \tilde{C} (for 1 mole solute in 100 g. \tilde{C}) = 29.6 (14).]

USES OF C

[For use of \bar{C} as solv. for fats and oils (15), as refrigerating liquids (16) (17) (18) (19) (20) (21), for extraction of caffeine from coffee (22), for dehydration (concentration) of propionic acid from aq. solns. (23), for sepn. of o- and p-isomers of various phenols (24), in dewaxing of mineral lubricating oils (25), for pretreatment in dyeing of cellulose esters and ethers (26) see indic. refs.]

PHYSIOLOGICAL BEHAVIOR OF C

Č acts as an anesthetic and narcotic, but full treatment of this aspect is beyond the scope of this work; for lead references, however, see below.

Toxicity of C. [For studies on toxicity of C see (27) (28) (29) (30) (31); for studies of narcotic action (31) (33) (34) (35) (36) see indic. refs.]

Antiseptic and disinfectant props. of \tilde{C} . [For studies of \tilde{C} from this viewpoint see (37) (38) (1).]

DETERMINATION OF C

Č is detd. by conversion of its halogen by pyrolytic or by chem. means completely to chloride ion followed by either volumetric or gravimetric detn. of the latter.

[For detn. of \bar{C} by methods involving pyrolytic decompn. of \bar{C} see (39) (40) cf. (41).] [For detn. of \bar{C} by methods involving decompn. of \bar{C} with Na + ethanolamine in dioxane see (42) cf. (43).]

[For detn. of Č by means of HgSO₄ catalyzed addn. of Br₂ (from bromide/bromate soln.) to its unsatd. linkage see (44).]

PREPARATION OF C

From various polychloroethanes. From 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750). [For prepn. of \bar{C} from acetylene tetrachloride by removal of 2 chlorine atoms with H_2 over Ni at 300-320° (45), with Fe or Al + aq. (46) (47) or Zn + aq. (47) (48), with acetylene over hydrogenating cat. (such as Ni) on activated carbon at 350° (49) preferably in pres. of aq. vapor (50), or by electrolytic reduction in pres. of ZnCl₂ (51) cf. (52) see indic. refs. — Note that \bar{C} is also one of the prods. of pyrolysis of acetylene tetrachloride over pumice at 700° (53).]

From 1,1,1,2-tetrachloroethane (3:5555). [For prepn. of Č from unsym.-tetrachloroethane with acetylene over hydrogenating cat. (such as Ni) on activated carbon at 350° (49) preferably in pres. of aq. vapor (50) see indic. refs.; note that mechanism yielding this result is unknown.]

From 1,1,2-trichloroethane (3:5330). [For prepn. of C from 1,1,2-trichloroethane (by loss of HCl) over CuCl₂ on pumice at 400° (54) or with MeOH over Al₂O₃ at 290° (MeCl (3:7005) is also formed) (55) see indic. refs.]

From 1,2-dichloroethane (3:5130). [For formn. of \bar{C} (22% yield) together with other prods. from ethylene (dı)chloride with Cl₂ in pres. of AlCl₃/NaCl/FeCl₃ at 400–480° see (56).]

From various mixed-halogenated ethanes. [For formn. of \tilde{C} from 1,2-dibromo-1,2-dichloroethane [Beil. I-93, I₁-(29), I₂-(64)] by removal of 2 Br with Zn in alc. (57) or with H₂ over Ni at 300-320° (45) see indic. refs.; from 2-bromo-1,1,2-trichloroethane (by elimination of Br-Cl) with Zn dust in boilg. alc. (58) (59) or from 2-iodo-1,1,2-trichloroethane on distn. at atm. press. (60) see indic. refs.]

From acetylene. With chlorine. [Starting from acetylene the addition of 1 mole of Cl_2 yields \bar{C} to which further addn. of Cl_2 gives 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750); for this reason most of the processes for prepn. of the latter cpd. by this method yield (or may be made to yield) \bar{C} as a by-product. Since the patents on the addn. of chlorine to acetylene have been extensively cited under the text of 1,1,2,2-tetrachloroethane (3:5750) (prepn. from acetylene), refer to that compound; however, see also (61) (62) (63).]

With other reagents. [For formn. of \bar{C} from acetylene with SbCl₅ (64) (65) cf. (57), with SbCl₅ + SbCl₃ (66), or with aq. ICl soln. (57), see indic. refs.]

CHEMICAL BEHAVIOR OF C

Pyrolysis of C. [C in s.t. at 360° for 10 hrs. is completely decomposed (64) into carbon + HCl.] (See also above under detn. of C.)

Oxidation of C. [C with O₂ in pres. of suitable cat. (e.g., Br₂ or H₂SO₄) gives (67)

chloroacetyl chloride (3:5235). — \ddot{C} with $O_2 + N_2$ in ultra-violet light evolves HCl but yields (68) only resinous (perhaps polymerization) products.]

[For study of rate of reactn. of C (in AcOH) with O3 see (69).]

[Note that C with NH₃ + air over Pt/Rh cat. at 820-850° gives (70) HCN.]

[C with air over (strongly chlorinated) CuO at 450° gives (76) much phosgene (3:5000).]

Stabilization of \bar{C} . [For stabilization of \bar{C} by addn. of small amts. of alc. NH₃ (71), with Et₃N (72), or with various phenols, amines, and aminophenols (73), see indic. refs.] (See also under corresp. subtopic of 1,1,2-trichloroethylene (3:5170).)

Polymerization of C. [C in the pres. of dibenzoyl peroxide (or other org. peroxides) on htg. under press. reacts with itself yielding mainly (74) a dimer, viz., 1,3,4,4-tetra-chlorobutene-1 (3:9058), accompanied by other prods.]

[For study of influence of radiation of 1980-1860 Å (from Al arc) and accompanying polymerization see (75).]

Reaction with halogens. Behavior of \bar{C} with Cl_2 . [\bar{C} adds 1 mole Cl_2 giving (69% yield (58)) 1,1,2,2-tetrachloroethane (3:5750); for study of this reactn. in light of 4360 \bar{A} see (77).] (See also under the individual cis- (3:5042) and trans- (3:5028) stereoisomers.)

Behavior with Br_2 . [\bar{C} adds 1 mole Br_2 giving (60) (57) 1,2-dibromo-1,2-dichloroethane [Beil. I-93, I_{1} -(29), I_{2} -(64)], b.p. 195° at 760 mm. (78) (59), b.p. 79.0-79.5° at 15 mm. (79); for study of photochem. addn. of Br_2 in gas phase (80) (81) and in CCl_4 soln. (81) (82) in sunlight (83) (84) see indic. refs.]

Behavior with 1Cl. [\bar{C} in CHCl₃ adds ICl in sunlight yielding (60) 2-iodo-1,1,2-trichloro-ethane, b.p. 77° at 9 mm., $D_1^{15} = 2.2760$ (60).]

Reaction with halogen hydrides. Reaction with HCl. [C in the absence of cat. does not add dry HCl; C with dry HCl in the pres. of small amts. AlCl₃ at 30-40° gives (87% yield (86)) (85) (104) 1,1,2-trichloroethane (3:5330) accompanied (85) by 1,1,2,3,4-pentachlorobutane (3:0750); this latter prod. and doubtless various others appear to be formed in the pres. of the AlCl₃ by various condensations among the various organic materials (see below).]

Reaction with H_2SO_4 . [\bar{C} is only slightly attacked at 20° by either 85% or 96% H_2SO_4 and no polymerization occurs (87); on running the H_2SO_4 layer into 10 vols. of cold aqual. evidence of formn. of chloroacetaldehyde (3:7212) was obtd. (87). — \bar{C} with conc. H_2SO_4 is unchanged up to 120° but at higher temps. carbonizes without evidence of formn. of chloroacetaldehyde (88).]

[However, \bar{C} with fuming H₂SO₄ (50% SO₃) or \bar{C} with SO₃ followed by aq. gives (88) (89) chloroacetaldehydesulfonic acid from which htg. with 80% H₂SO₄ gives (88) (89) chloroacetaldehyde (3:7212).]

Behavior with alkali. [C with alc. KOH (90) (91) loses 1 HCl yielding chloroacetylene (3:7000); this prod. sometimes (92) (93) causes spontaneous ignition of the system especially when its alc. soln. comes in contact with air in cleaning the reaction flask (91).] (See also under the individual cis- (3:5042) and trans- (3:5028) stereoisomers.)

[Note that C with alc. NaSH does not react even after 6 hrs. reflux. (92).]

Behavior with NH₃. [Č with liq. NH₃ under high press. reacts only very slightly although a small amt. of chloroacetylene (3:7000) (from loss of HCl) is formed (94).]

Behavior with metals. [For study of corrosion of common metals by C see (5).]

Behavior with other inorganic reactants. [C with liq. nitryl chloride (ClNO₂) in s.t. at 100° for 3 hrs. gives by addn. to unsatd. linkage (67% yield (95)) 2-nitro-1,1,2-trichloroethane, pale yel. oil, b.p. 63° at 13 mm. — C cautiously added to 4 vols. of a mixt. of conc. + fumg. HNO₃ and warmed gives (96) a small amt. of nitro-trichloromethane (chloropicrin). — C with liq. N₂O₄ at ord. temp. for 24 hrs. in an unsealed tube (use of sealed tube leads to serious explosions) reacts (96) to give a little oxalic acid dihydrate (1:0445) together with an unidentified lachrymatory oil.]

BEHAVIOR WITH ORGANIC REACTANTS

With hydrocarbons. [\bar{C} (1 mole) with cyclopentadiene (1 mole) (1:8030) in s.t. at 180-190° for 15 hrs. yields (97) two Diels-Alder type adducts. — For reactn. of \bar{C} with C_6H_6+Al/Hg see under individual cis- (3:5042) and trans- (3:5028) stereoisomers.]

With other chlorinated hydrocarbons. (For reaction of C with itself see above under polymerization.)

With methylene (di)chloride (3:5020). [\bar{C} (1 wt. pt.) with CH₂Cl₂ (3 wt. pts.) + AlCl₃ (0.3 wt. pt.) at 40° for 8 hrs. gives (24% yield (98)) 1,1,2,3-tetrachloropropane (3:6035)].

With chloroform (3:5050). $[\bar{C}$ (1 wt. pt.) with CHCl₃ (3 wt. pts.) + AlCl₃ (0.25 wt. pt.) stirred with sand for 20 hrs. at 30° (99) cf. (100) (101) (102) gives (yields: 63% (99), 70-75% at 50° (100), 46% at 17° in 22 hrs. (100)) 1,1,2,3,3-pentachloropropane (3:6280).]

With carbon tetrachloride (3:5100). [C with CCl₄ + AlCl₃ gives (101) (102) cf. (103) 1,1,1,2,3,3-hexachloropropane (3:6460); for reactn. of this system yielding heptachloropentenes see (103).]

With 1,1,2-trichloroethane (3:5330). [C with 1,1,2-trichloroethane + AlCl₃ (1%) at 35-40° for 5 days gives (104) two diastereoisomeric 1,1,2,3,4-pentachlorobutanes, viz., liq. (3:9068) and solid (3:0750).]

With 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750). [C with acetylene tetrachloride + AlCl₃ gives a mixt. from which can be isolated only (104) solid 1,1,2,3,4-pentachlorobutane (3:0750).]

With 1,1,1,2-tetrachloroethane (3:5555). [C with unsym.-tetrachloroethane + AlCl₃ at 40° for 10 days gives (104) 1,1,1,4,4-pentachlorobutene-2 (3:9054).]

With pentachloroethane (3:5880). [Č with pentachloroethane + AlCl₃ at 40° for 12 days presumably first forms both 1,1,2,2,3,4,4-heptachlorobutane (3:9056) and 1,1,1,2,3,4,4-heptachlorobutane, but the latter loses HCl and by further reaction and/or resinification is lost in the accompanying resins (104); the HCl thus split out adds (in the pres. of AlCl₃) to Č yielding 1,1,2-trichloroethane which then condenses with more Č as stated above (104).]

With hexachloropropene (3:6370). [\bar{C} with hexachloropropene + AlCl₃ in CH₂Cl₂ soln. yields (105) a single 1,1,2,3,3,4,5,5-octachloropentene-1, b.p. 145-147° at 11 mm., 113-113.5° at 2 mm., $D_{21}^{21} = 1.749$, $n_{21}^{20} = 1.5607$ (105). This prod. with conc. H₂SO₄ gives (80% yield (105)) a mixt. of pentachlorobutenecarboxylic acids (105).]

Behavior with organic OH or SH derivs. [\bar{C} (1 mole) with C_2H_6SH (2 moles) in alc. KOH (2.6 moles) refluxed $\frac{1}{2}$ hr. gives (yield not stated (106)) 1,2-bis-(ethylthio)ethylene, b.p. 170° at 13 mm.]

[C (1 mole) with benzyl mercaptan (2 moles) in alc. KOH refluxed 7 hrs. gives (yield not stated (106)) 1,2-bis-(benzylthio)ethylene, white ndls. from alc. or AcOH, m.p. 61°; this prod. in CS₂ adds 1 Br₂ giving 1,2-dibromo-1,2-bis-(benzylthio)ethane, ndls. from ether, m.p. 73-74°.]

[Č (1 mole) with thiophenol (2 moles) in alc. NaOEt (2 moles) refluxed 24 hrs., poured into aq., gives (yield not stated (108)) 1,2-bis-(phenylthio)ethylene, b.p. 235-242° at 760 mm., pl. from lt. pet., m.p. 62°.]

Č (1 mole) with p-tolylmercaptan (2 moles) in 7% alc. KOH refluxed 3 hrs. gives (90% yield (107)) 1,2-bis-(p-tolylthio)ethylene, ndls. from alc., m.p. 93°; this prod. in CHCl₃ adds 1 mole Br₂ giving (100% yield) 1,2-dibromo-1,2-bis-(p-tolylthio)ethane, cryst. from pet. ether, m.p. 72° (107).

[For analogous reactn. with \bar{C} of o-nitrothiophenol or p-nitrothiophenol see (106).]

[C (1 mole) with an alk. salt of thiosalicylic acid (o-mercaptobenzoic acid) reacts similarly giving (109) (110) cf. (111) (112) 1,2-bis-(o-carboxyphenylthio)ethylene ("S,S-vinylene-

bis-thiosalicylic acid") [Beil. X-128, X_1 -(55)]; this prod. with KOH/NaOH at 220-230° gives (113) 3-hydroxythionaphthene (thioindoxyl) [Beil. XVII-119, XVII₁-(60)], or by actn. of acid condensing agents (e.g., fuming H_2SO_4 , $ClSO_3H$, etc.) yields (114) the important dyestuff thioindigo [Beil. XIX-177, XIX₁-(690).] — Note that the corresp. condens. of \bar{C} with salicylic acid (o-hydroxybenzoic acid) or with anthranilic acid (o-aminobenzoic acid) cannot be effected (112).]

Behavior with other misc. organic reactants. [\tilde{C} with paraformaldehyde (1:0080) + conc. H₂SO₄ gives (115) a resin (cf. behavior of 1,1,2-trichloroethylene (3:5170)).]

[\bar{C} (1 mole) with EtMgBr (2 moles) yields (116) C_2H_6 + BrMgC=C-MgBr + MgCl₂.] [\bar{C} does not (117) react with acetyl iodide even after 150 days at 25°.]

COLOR TESTS FOR C

- © Color test with α-naphthol/cyclohexanol. C

 (1 drop) with 2 ml. of a 2% soln. of α-naphthol (1:1500) in cyclohexanol (1:6415) + 2 pellets solid NaOH boiled 25 seconds, cooled, gives after acidification with AcOH or 85% H₂SO₄, stdg. 1 min., and shaking a violet or red-violet color (118). [Note that under these conditions the response given by methylene (di)chloride (3:5020) is green-blue; by both CHCl₃ (3:5050) and CCl₄ (3:5100) is intense blue; by 1,2-dichloroethane (ethylene dichloride) (3:5130) is colorless to pale green; by 1,1,2-tertachloroethane (acetylene tetrachloride) (3:5750) is intense green-blue; by pentachloroethane (3:5880) is gray-green; by 1,1,2-trichloroethylene (3:5170) is intense green-blue; and by tetrachloroethylene (3:5460) is green (118).]
- Mercury bis-(chloroacetylide) $Hg(-C \equiv C Cl)_2$. Shining white pl. from hot CHCl₃; although reported to melt at 185° (119) (120) (121) has also been found (122) to explode with great violence well below that temperature, i.e., 174–175° (122). [From \bar{C} with aq. $Hg(CN)_2 + KOH$ on shaking at room temp. (91) (123) for 48 hrs. (119), or from \bar{C} in alc. run into a stirred aq. soln. of $HgCl_2 + NaCN + KOH$ (120), or from \bar{C} shaken with an aq. soln. of HgO + NaCN + NaOH (122). Note, however, that in fact this prod. results only from the higher-boilg. (cis) stereoisomer of \bar{C} (3:5042) and that the lower-boilg. (trans) stereoisomer (3:5028) reacts much more slowly and quite differently to yield mercury bis-(α , β -dichloroethylenide), m.p. 50.3° (122). Note further that by the above treatment 1,1,2-trichloroethylene (3:5170) gives mercury bis-(trichloroethylenide), m.p. 83°, but this prod. is much more sol. in CHCl₃ than the analogous material from \bar{C} (for use in detect. of \bar{C} in pres. of 1,1,2-trichloroethylene see (123)).]

Liquid. — [For b.p. at various press. from 70-277 mm. see (11).] — Alm. insol. aq. [for precise data see (5) (6) (7) (11).] — [For f.p./compn. data of mixts. with 2,2-dichloropropane (3:7140) see (10).] — [For use as dry cleaning fluid see (12); for use as corrosion inhibitor for alk. on tinned metal see (13).]

Č forms with EtOH (1:6130), b.p. 78.3°, a const.-boilg. mixt., b.p. 54.6°, contg. 88.5 wt. % Č (4); Č forms with isopropyl alc. (1:6135), b.p. 82.45°, a const.-boilg. mixt., b.p. 56.6°, contg. 82 wt. % Č (4); Č forms with ter-butyl alc. (1:6140), b.p. 82.5°, a const.-boilg. mixt., b.p. 57.1°, contg. 94 wt. % Č (14); Č forms with acetone (1:5400), b.p. 56°, a const.-boilg. mixt., b.p. 57.55°, contg. 70 wt. % Č (14); Č forms with CS₂, b.p. 46.3°,

const.-boilg. mixt., b.p. 44.75°, contg. about 28 wt. % \bar{C} (14). [For study of b.p., D, and vapor-liq. equil. of binary mixts. of \bar{C} with CHCl₃ (3:5050), CCl₄ (3:5100), or with 1,2-dichloroethane (3:5130) see (27).]

[For soly. of aq. in \bar{C} see (29); for adsorption of \bar{C} by activated carbon at various temps. see (30).)

[For prepn. of \tilde{C} from acetaldehyde (1:0100) with PCl₅ see (15) (16) (17); from vinyl chloride (3:7010) by catalyzed addn. of HCl see (18) (19) (20) (note that in absence of catalyst addn. of HCl to vinyl chloride is very slow (21)); for formn. of \tilde{C} (22.6%) together with other products from ethane with Cl₂ above 290° in pres. of ethylene see (28).

Č on passing over pumice at dark red heat yields (22) (23) vinyl chloride (3:7010) + HCl.

[For reactn. of \tilde{C} + AlCl₃ with 1,2-dichloroethylene (3:5030) or with trichloroethylene (3:5170) yielding polychlorobutanes see (24); for reactn. of \tilde{C} with amylidene disodium see (25).]

 \bar{C} on htg. in s.t. at 120° with aq. alc. soln. of 2 moles Na (or K) α -naphtholate yields (26) acetaldehyde di- α -naphthylacetal, ndls., m.p. 117° (26).

See also both trans-1,2-dichloroethylene (3:5028) and ordinary (mixt. of cis and trans) 1,2-dichloroethylene (3:5030); the following text is restricted to studies on substantially pure cis-stereoisomer.

Note carefully that 1,2-dichloroethylene is *not* the same as ethylene (di)chloride (3:5130) (there are an almost incredible number of errors in the literature involving this point); neither is it the same as the now very important 1,1-dichloroethylene (vinylidene (di)chloride) (3:5005).

GENERAL DATA ON C

Note that substantially pure \bar{C} is commercial solvent in U.S.A. under designation "Di-60" (referring to the two chlorine atoms and the b.p.) [for study of thermal conductivity and for tabulation of constants of comml. \bar{C} see (18). — For toxicity of \bar{C} see (40) (23). — For use of \bar{C} in extraction of caffeine from coffee see (24)].

[For data on vap. press. of \bar{C} over temp. range 27-59.8° see (12). — For data on flammability of \bar{C} see (19). — For ebullioscopic constant of \bar{C} , viz., 34.4° (for 1 mole solute in 100 g. \bar{C}), see (20).]

Binary systems contg. $\bar{\mathbf{C}}$. (See also below under azeotropes.) — $[\bar{\mathbf{C}} + trans-1,2-dichloroethylene (3:5028):$ for use of n_D^{25} in detn. of composition of mixt. see (11); for f.p./compn. data (cutectic, f.p. -91° , contg. about 71% $\bar{\mathbf{C}}$) see (17). — For f.p./compn. data on binary systems $\bar{\mathbf{C}} + ethylene$ (di)chloride (3:5130), $\bar{\mathbf{C}} + 1,1,2,2$ -tetrachloroethane (acetylene tetrachloride) (3:5750), or $\bar{\mathbf{C}} + ethylene$ (di)bromide see (17). — For study of soly. of various other cis/trans isomers in $\bar{\mathbf{C}}$ see (5).]

Quaternary systems contg. \bar{C} . [For study of system contg. \bar{C} + CHCl₃ (3:5050) + trichloroethylene (3:5170) + EtBr (eutectic, f.p. -139.1°, contg. 13.8 wt. % \bar{C} + 19.7 wt. % CHCl₃ + 21.6 wt. % trichloroethylene + 44.9 wt. % EtBr recommended as a non-inflammable mixt. for low-temp. cryostats) see (22); for mixt. of the above four compds. + methylene dichloride (3:5020) (similarly recommended) see (22).]

Azeotropes contg. $\bar{\mathbf{C}}$. Binary azeotropes — $\bar{\mathbf{C}}$ with aq. forms a const.-boilg. mixt., b.p. 55.3°, contg. 96.65% $\bar{\mathbf{C}}$ (41) (42). — $\bar{\mathbf{C}}$ with EtOH (1:6130) forms a const.-boilg. mixt., b.p. 57.7° at 760 mm. (21) (41) (42), contg. 90.20% $\bar{\mathbf{C}}$ (41) (42) = 81.4 mole % $\bar{\mathbf{C}}$ (21).

Ternary azeotropes. \bar{C} with EtOH (1:6130) + aq. forms a const.-boilg. mixt., b.p. 53.8°, contg. 90.50% \bar{C} + 6.65% EtOH + 2.85% aq. (41) (42).

PREPARATION OF C

Pure \tilde{C} is usually obtd. by careful fractional distillation at ord. press. of the mixt. of cis and trans stereoisomers comprising ord. 1,2-dichloroethylene (3:5030) [for brief comments on this mode of sepn. see (1) (2) (6) (7) (8) (9) (10) (11) (13) (15) (27); note that some workers (13) recommend distn. in atmosphere of CO_2 . — For detn. of the % compn. of mixts. of \tilde{C} with its stereoisomer by means of n_D^{25} see (11); by means of dielectric const. see (13) (27)].

[For study of possibility of sepn. of \tilde{C} from its stereoisomer by differential adsorption on silica gel see (25).]

[For prepn. of \bar{C} from pure trans stereoisomer (3:5028) by isomerization with 6 wt. % Br₂ in dark for 24 hrs. followed by subsequent fractionation of the resultant mixt. see (11).]

ISOMERIZATION OF C

 \bar{C} under the influence of heat, light, or various catalysts in part isomerizes to trans-1,2-dichloroethylene (3:5028). — [For study of thermal isomerization of \bar{C} in vapor phase at 185–275° (26), up to 350° (27), up to 975° (28), in liquid phase or in various solutions (13) see indic. refs.; note that the equilibrium mixt. at 300° conts. $60.8 \pm 0.7\%$ \bar{C} , at 350° conts. $59.4 \pm 0.3\%$ \bar{C} (27), at 975° conts. 52.3% \bar{C} (28). — For study of kinetics of thermal isomerization see (29).]

[For patent on isomerization of pure \tilde{C} to a mixt. contg. 18% trans stereoisomer by means of a small amt. Br₂ at 30° or above in pres. of cat. or in vapor phase at not over 300° see (30).]

CHEMICAL BEHAVIOR OF C

Reactions with inorganic compds. \tilde{C} (in vapor phase at 95° in light of 4360 Å (31)) with Cl₂ (in absence of O₂), or \tilde{C} as liquid with SO₂Cl₂ (1½ moles) in pres. of trace of dibenzoyl peroxide refluxed 3 hrs. in dark (8), adds 1 mole halogen giving (85% yield (8)) 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750).

 \tilde{C} with Br₂ in sunlight adds 1 mole halogen yielding (2) (32) 1,2-dibromo-1,2-dichloro-ethane [Beil. I-93, I₁-(29), I₂-(64)], b.p. 195° at 760 mm. (3) (33), b.p. 79.0-79.5° at 15 mm. (2). — [For extensive study of influence of O₂ and other factors see (32); for study of kinetics in CCl₄ soln. see (2) (34) (35); note that rate of addn. of Br₂ either directly or in CCl₄ is half as great as for the stereoisomeric trans form (3:5028) but that it is increased in pres. of SbBr₃ (35).]

 \tilde{C} in the absence of AlCl₃ or other cat. does not add dry HCl; satn. of \tilde{C} with dry HCl changes n_D^{25} by an amount corresp. to only 2% change in compn. (11).

[Č with alc. KOH splits out 1 HCl yielding chloroacetylene (3:7000); note that this reactn. is about 20 times as fast for Č as for its trans stereoisomer (2).]

Č with aq. NaOH/Hg(CN)₂behaves quite differently from its trans stereoisomer (3:5028): on shaking at room temp. with specified conens. (16) Č begins to react within 30 min., losing 1 HCl and pptg. mercuric bis-(chloroacetylide), Hg(—C≡C—Cl)₂; this prod. cryst. from CHCl₃ (36) (37) (38) in white shining pl. with characteristic acetylene-like odor and although alleged to melt at 185° (36) (37) has also been found to explode with great violence well below that temp., i.e., 174–175° (16).

Reactions with organic compds. [\bar{C} with C_6H_6+Al/Hg at 0° gives same prods. as does the ordinary (mixture) 1,2-dichloroethylene (3:5030) (presumably indicating partial isomerization of \bar{C}); these prods. include dibenzyl, triphenylethane, tetraphenylethane, etc. (15).]

MISCELLANEOUS PHYSICAL PROPERTIES OF C

(1) (60).

VARIOUS SOLUBILITY RELATIONS

With water. C is only very slightly sol. aq. and is eas. volat. with steam; e.g., 100 g. aq. at 15° dissolves 0.852 g. C (18); water satd. with C conts. at 20° 0.8% C (63) cf. (64). For studies of soly. of aq. in C at 0° (65), 20° (63), 25° (65), and 30° (65) see indic. refs.; note that at 20° \bar{C} satd. with aq. conts. 99.8% \bar{C} and has $D_4^{20} = 1.486$ (63).

With various inorganic compounds. [For data on soly. in C of H₂ (66), O₂ (78), HCl (67) (68) (69) (79), HBr (68) (69), H₂S (67), NH₃ (67), CO₂ (70) (80) (81), N₂O (81), and NO₂ (70) see indic. refs. — For data on soly. of I₂ in $\bar{\mathbb{C}}$ see (71) (72) (73) (74); for study of nature of I₂ solns. in C see (75); for soly. of I₂ in vapor of C see (76).]

With organic materials. [For study of absorption of vapor of C by kerosene see (77).]

BINARY SYSTEMS CONTAINING C

(See also azeotropes containing C)

 \tilde{C} with various inorganic compounds. $\tilde{C} + aq.$: for soly. data and diag. see (64); note that a previously described (82) hydrate of \tilde{C} could not be confirmed (64). $-\tilde{C} + Cl_2$: for f.p./compn. data and diag. (note that 4 different compounds are formed) see (34). $-\tilde{C} + Br_2$: for f.p./compn. data and diag. see (34) (36) (note that no compds. are formed and that eutectic has m.p. -72° (34) with about 86 mole \tilde{C}).

 $\tilde{\mathbf{C}}$ with org. cpds. of Order 1. \tilde{C} + n-hexane (1:8530): for f.p./compn. data see (83); for densities over range -90° to $+60^{\circ}$ see (85). $-\tilde{C}$ + C_6H_6 (1:7400): for f.p./compn. data and diag. see (38); for D_{25}^{25} /compn. data over entire range see (19); for D_{25}^{25} /compn. data see (18); for liq. vapor equil. see (19) (117) (112) (124). $-\tilde{C}$ + toluene (1:7405): for f.p./compn. data see (83); for data on specific gravity of system from 15-25° see (86); for study of liq-vapor equil. see (123). $-\tilde{C}$ + cyclohexane (1:8405): for f.p./compn. data see (83); for D_{40}^{20} compn. see (47).

 $\bar{C} + MeOH$ (1:6120): for f.p./compn. data see (37) (84); for D_D^{25} /compn. and n_D^{25} /compn. see (44). $-\bar{C} + EtOH$ (1:6130): for D_4^{25} /compn. data see (45) (46). $-\bar{C} + benzyl$ alc. (1:6480): for density/compn. data over entire range see (87).

 \bar{C} + diethyl ether (1:6110): for f.p./compn data and diag. see (42) (88); for D_4^{20} /compn. see (47). — \bar{C} + disopropyl ether (1:6125): for D_4^{20} /compn. see (47). — \bar{C} + dioxane-1,4 (1:6400): for D_4^{20} /compn. see (47). — \bar{C} + ethylene glycol dimethyl ether (1:6141): for study of heat of mixing see (89). — \bar{C} + tetraethylene glycol dimethyl ether: for study of heat of mixing see (89).

 \ddot{C} + dimethyl carbonate (1:3046): for D_4^{25} /compn. data see (20). — \ddot{C} + diethyl carbonate (1:3150): for D_4^{25} /compn. data see (20).

 \bar{C} + acetone (1:5400): for f p./compn. data see (27); for D_2^{20} /compn. (47), D_2^{25} /compn. (19) (46), n_D^{25} /compn. (19), and n_D^{25} /compn. (49) data see indic. refs.; for refractive index/compn. for light of various wave lengths see (52).

With org. cpds. of Order 2. \ddot{C} + nutrobenzene: for f.p./compn. data and diag. (eutectic, f.p. -71.0° conts. 81.5 wt. % \ddot{C}) see (61). $-\ddot{C}$ + anulune: for f.p./compn. data and diag. see (27). $-\ddot{C}$ + N,N-dimethylandine: for D_{4}^{25} , D_{4}^{40} , n_{D}^{248} , and $n_{D}^{39.5}$ over entire range of composition see (43). $-\ddot{C}$ + quinoline: for D_{4}^{20} /compn. data see (47).

With org. cpds. of Order 3. $\bar{C}+CH_2Cl_2$ (3:5020): for f p./compn. data and diag. (eutectic, f.p. -108.4° conts. 29.5 wt. % \bar{C}) see (39); for data on b.p., D_4^{20} , and liq.-vapor equil. see (90). $-\bar{C}+CCl_4$ (3:5050): for f.p./compn. data and diag. (eutectic, f.p. -81.4° conts. 50.6 wt. % \bar{C} (39)) (36) (83) (91) see indic. refs.; for D_4^{20} /compn. (48) (90), D_{25}^{25} /compn. (8), b.p. and liq.-vapor equil. (90) see indic. refs. $-\bar{C}+1,1$ -dichloroethane (3:5035): for b.p., D_4^{20} , and liq.-vapor equil. see (90). $-\bar{C}+1,2$ -dichloroethane (3:5130): for data on vap. press. (92) and liq.-vap. equil. (93) see indic. refs. $-\bar{C}+1,1,1$ -trichloroethane (3:5058): for f.p./compn. data see (94). $-\bar{C}+1,1,2$ -trichloroethylene (3:5170): for f.p./compn. data and diag. (eutectic, f.p. -100.2° , conts. 31.2 wt. % \bar{C}) see (39). $-\bar{C}+\beta,\beta'$ -dichlorodiethyl ether (3:6025): for D_4^{20} /compn. data see (47).

With org. cpds. of higher orders. $\bar{C}+1,2$ -dibromoethane: for D_4^{20} /compn. data see (47). $-\bar{C}+CBr_4$: for f.p./compn. data and diag. see (91). $-\bar{C}+CHI_3$: for vap. press. data see (95). $-\bar{C}+CS_2$: for f.p./compn. data see (83); for D_{15}^{15} compn. (96) or D_{25}^{25} /compn. (8) see indic. refs.; for liq.-vapor equil. data see (97).

TERNARY SYSTEMS CONTAINING C (See also azeotropes containing C)

 \ddot{C} + acetone (1:5400) + H_2O : for studies of liq. equil. at 25° see (98) (99) (100) (101) (102). — \ddot{C} + acetone (1:5400) + MeOH (1:6120): for ternary b.p. diag. see (103). — \ddot{C} + acetone (1:5400) + diethyl ether (1:6110): for data on refraction see (104). — \ddot{C} + acetone (1:5400) + disopropyl ether (1:6125): for ternary b.p. diag. see (103).

 \bar{C} + acetone (1:5400) + \bar{C}_6H_6 (1:7400): for ternary b.p. diag. see (103) (19) (105); for refractive data see (104).

 \bar{C} + acetone (1:5400) + CH_2Cl_2 (3:5020): for ternary b.p. diag. see (103).

 \bar{C} + acetic acid (1:1010) + aq.: for studies of liq. equil. at 25° see (104) (106) cf. (99). — \bar{C} + acetic acid + lubricating oil: for studies of liq. equil. at 25° see (107).

 $\bar{C} + CH_2Cl_2$ (3:5020) + CCl_4 (3:5100): eutectic, f.p. -111.4°, conts. 27 wt. % \bar{C} + 60 wt. % CH_2Cl_2 + 13 wt. % CCl_4 (39).

QUATERNARY SYSTEMS CONTAINING C

 \bar{C} + acetone (1:5400) + AcOH (1:1010) + aq.: for study of liq. equil. at 25° see (100); for study of use of system in mixed solv. extraction of lubricating oils see (107) (108). — \bar{C} + trans-1,2-dichloroethylene (3:5028) + 1,1,2-truchloroethylene (3:5170) + C_2H_5Br : eutectic, f.p. -139.1°, conts. 17.7 wt. % \bar{C} + 13.8 wt. % trans-1,2-dichloroethylene + 21.6 wt. % trichloroethylene + 44.9 wt. % C_2H_5Br (39).

BINARY AZEOTROPES CONTAINING C

 $\overline{C} + H_2O$: \overline{C} forms with aq. a const.-boilg. mixt., b.p. 56.1°, contg. 97.5 wt. % \overline{C} (14). C + MeOH (1:6120): C forms with MeOH a const.-boilg. mixt., b.p. 53.5° (103) (109), contg. 87.5 wt. % (103) = 65 mole % (109) \ddot{C} , cf also (110) (111) (4) (112) (113). $-\ddot{C}$ + EtOH (1:6130): C forms with EtOH a const.-boilg. mixt., b.p. 59.3° at 760 mm. (111), 59.35° at 760 mm. (14), contg. 93.2 wt. % \bar{C} (111) cf. (14) = 84 mole % \bar{C} (111) (see also (4) (110)) of $D_{15}^{15} = 1.4112$ (14); for thermodynamic study of this system see (114); for study of liq.-vap. equil. see (45). — \ddot{C} + isopropyl alc. (1:6135): \ddot{C} forms with isopropyl alc. a const.-boilg. mixt., b.p. 60.8° at 760 mm. (111), contg. 95.5 wt. % \overline{C} (111) = 92 mole % \bar{C} (111). — \bar{C} + formic acid (1:1005): \bar{C} forms with formic acid a const.-boilg. mixt., b.p. 59.15° at 760 mm. (115), contg. 85 wt. % C (115). — C + ethyl formate (1:3000): C forms with ethyl formate a const.-boilg. mixt., b.p. 62.8° (116), 62.7° (111) at 760 mm., contg. 87 wt. % \bar{C} . — \bar{C} + methyl acetate (1:3005): \bar{C} forms with methyl acetate a const.boilg. mixt., b.p. 64.8° at 760 mm. (111), contg. 77 wt. % C (111); b p. 63.0° at 726.3 mm. contg. 50 wt. % C (117); b.p. 62.6° at 717.5 mm. contg. 56 wt. % C (117); for study of constant evapn. system see (125). — \bar{C} + disopropyl ether (1:6125): \bar{C} forms with diisopropyl ether a const.-boilg. mixt., b.p. 70.5°, contg. 36.5% wt. % \bar{C} (103). — \bar{C} + acetone (1:5400): Č forms with acetone a const.-boilg. mixt., b.p. 64.5° at 760 mm. (109) (103) (19) (105) (111), contg. 79.5 wt. % Č (111) (103), 78 wt. % Č (19) (105), 65.5 mole % Č (109); b.p. 62.4° at 732.0 mm. contg. 80 wt. % C (117); b.p. 62.25° at 719 mm. contg. 86 wt. % C (117) cf. also (112); b.p. 61.95° at 716.5 mm. contg. 85 wt. % C (117): for studies of liq.-vapor equil. of \bar{C} + acetone see (19) (105) (117) (112), for study of vap. press. see (26) (49) (118) (119) (120) (121); for study of distn. of \bar{C} + acetone in wetted wall column see (122).

TERNARY AZEOTROPES CONTAINING C

 \bar{C} + EtOH (1:6130) + aq.: \bar{C} forms with EtOH + aq. a ternary const.-boilg. mixt., b.p. 55.4-55.5° at 760 mm., contg. about 92.5 wt. % \bar{C} + 4.0 wt. % EtOH + 3.5 wt. % aq. (14).

OTHER SELECTED PHYSICAL CHARACTERISTICS OF C

[For study of thermal conductivity of \bar{C} (126) (127) see indic. refs.; for studies of heat capacity of \bar{C} (17) as calcd. from spectroscopic data (128) (129) see indic. refs.; for study of critical temp. of \bar{C} and its microdetn. see (130); for studies on value of ebullioscopic const., viz., 3.766° per mole solute in 100 g. \bar{C} (131), and review of prior work see (131).]

[For studies of adsorption of C on various carbons (132) (135) (155), animal charcoal (133) (134), wood or cocoanut charcoal (136) (137) (138) (139) (140) (141) (142), glass wood (143) (144), glass powder (145), alumina gel (146) (147), silica gel (148), vitreous silica (149), Fe(OH)₃ gel (150), Cr(OH)₃ gel (151) cf. (152), TiO₂ gel (153) (154), see indic. refs.]

PHYSIOLOGICAL ASPECTS OF C

 \tilde{C} was first prepared in 1831 by three independent workers, viz., Liebig, Souberain, and Guthrie (for amplification see (1)). \tilde{C} has long been used in medicine especially as an anesthetic but a detailed account of this aspect is beyond the scope of this book. [For history and clinical use of \tilde{C} see (156); for report of 3000 cases of anesthesia with \tilde{C} see (157). For examples of articles commemorative of the centenary of the discovery of \tilde{C} and its use in anesthesia see (158) (159) (160) (161).]

The vapor of \tilde{C} in conens. of 6.8-8.2% by volume in air will kill most animals in a short time; a conen. of 1.4% by volume is dangerous to life after 30-60 min exposure; the max. conen. tolerable for 60-min. exposure without serious disturbances is 0.5-0.6% by volume; the max. conen. tolerable for several hrs. or for prolonged exposure with but slight symptoms is 0.2% by volume (163).

[For impt. study of toxicity of C including its effect upon various organs see (164).]

USES OF C

 \ddot{C} is widely used as solvent and chemical reactant and any detailed survey of this aspect is beyond the scope of this book. [However, for use of \ddot{C} as solvent for ozonization reactions (24), as means of dehydration of EtOH (165), in mixt. with 100% HNO₃ + Ac₂O as nitrating or nitroesterifying reagent (166), in colorimetric detn. of I₂ (167), or in prepn. of AlCl₃ from Al + Br₂ + \ddot{C} (168) see indic. refs.]

DETECTION OR DETERMINATION OF C

Detection of C. [For study of isolation of C from very dil. solns. by distn. see (169).] Note that many of the tests for C may be given by other haloforms (e.g., CHBr₃, CHI₃, etc.) or by trichloroderivatives which under particular test conditions yield CHCl₃ by cleavage (e.g., chloral (3:5210), chloral hydrate (3:1270), 1,1,1-trichloro-2-methyl-propanol-2 = "chloretone" (3:2662), loss of CO₂ (trichloroacetic acid (3:1150)) or other decompns.

[For study of detectn. of \bar{C} by color reaction with pyridine + alk. (Fujiwara reaction) see (170); note also further references to this test under detn. of \bar{C} (below) and under trichloroethylene (3:5170).]

[For detectn. of C by reaction with aq. NaOH + NH₄OH to give NaCN and after acidification detectn. of resultant HCN by drop test methods see (171).]

[For color reactions of \bar{C} with phenols under various circumstances, e.g., \bar{C} with resorcinol (1:1530) + NaOH (172) (173), with α -naphthol (1:1500) + cyclohexanol (1:6415) (174), with 2,7-dihydroxynaphthalene (1:1594) + cyclohexanol (175), see indic. refs. For use of last two methods in distinction of \bar{C} from CH₂Cl₂ (3:5020) and from CCl₄ (3:5100) see (173) (174); also at end of text of this compound under \mathfrak{P} .]

[For distinction of Č from CCl₄ (3:5100) by its greater solvent power for papaverine hydrochloride (176) or quinine sulfate (177) see indic. refs.]

Note that C reduces Fehling's soln. on htg. whereas CCl₄ does not (177).

Note also that Č with aniline + alc. alk. on htg. gives characteristic odor of phenyl isocyanide (carbylamine test) (178).

Determination of C. Methods for the quant. detn. of C may be classified into two groups: (1) those depending upon total conversion of the chlorine to the ionized form followed by its determination by conventional methods; and (2) methods based upon color reactions.

[For studies of methods of the first type involving decomposition of \tilde{C} by combustion in air (179) (187) or H_2 flame (180), by combined combustion and hydrolysis in moist air at 1000–1100°C. (181) cf. (182), by alkaline hydrolysis (183) (185), by reduction using Na + triethanolamine (184) see indic. refs. For automatic apparatus for detn. of small conens. of \tilde{C} in air see (186); for detn. of \tilde{C} in mixtures contg. nonvolatile chlorides see (188) (189) (190) (191).]

[For studies on use of color reaction with pyridine and alkali (Fujiwara reaction) as means for quant. detn. of \bar{C} in air, soil, blood, tissue, etc., see (170) (192) (193) (194) (195) (196) (197) (198) (199). — For use of color reaction of \bar{C} with α -naphthol (1:1500) or β -naphthol (1:1540) in alc. KOH as colorimetric method for detn. of \bar{C} see (200).]

DETECTION OF OTHER COMPOUNDS IN C

[For studies on detn. of EtOH (1:6130) in \bar{C} see (201) (202) (203); on detection of acetone (1:5400) in \bar{C} see (204) (205); on detection of aldehydes in \bar{C} see (206); on detection of CCl₄ (3:5100) in \bar{C} see (175) (207) (208) (209); on detection of COCl₂ (3:5000) in \bar{C} see (210) (211) (212) (213) and also under phosgene (3:5000).]

PREPARATION OR FORMATION OF C

From methane. The formation of \bar{C} together with CH₃Cl (3:7005), CH₂Cl₂ (3:5020), CCl₄ (3:5100), and other products has been very extensively studied from many viewpoints. The literature of this reaction, however, is so extensive and diffuse that no complete survey can be detailed in this book. For concise reviews of the older literature see (1) (214); for additional references see text of methylene (di)chloride (3:5020) under its formation from methane.

From carbon tetrachloride. [For prepn. of \bar{C} from CCl₄ (3:5100) by reduction using Zn + H₂SO₄ (215) (216) cf. (1) (214), finely divided Fe + aq. (217) + cat. (218) (219), Fe(OH)₂ + aq. alk. (220), or electrolytic reduction (221) see indic. refs.]

From other halogenated hydrocarbons. [For formn. of \tilde{C} from mixts. of CH₂Cl (3:7005) + CH₂Cl₂ (3:5020) with Cl₂ + cat. at 400-650° (223), from CHCl₂F + AlCl₃ as directed (CHClF₂ is also formed) (224), from CCl₃Br with boilg. alk. Na₂AsO₃ (225), from 1.1,2,2-tetrachloroethane (3:5750) or its dehydrochlorination prod. trichloroethylene (3:5170) by pyrolysis at 700° (226), from 1,1,1,2,2,3,3-heptachloropropane (3:0200) over Cu₂Cl₂ below 250° (227) see indic. refs.]

From various carbonyl compounds. [For prepn. of \bar{C} from acetaldehyde (1:0100) with alkaline hypochlorite soln. at 70-80° (228) (229) cf. (1) (214) see indic. refs. For prepn. of \bar{C} from trichloroacetaldehyde (chloral) (3:5210) or from chloral hydrate (3:1270) by warming with alkalies or alkaline reagents see texts of these compounds.]

[For prepn. of C from acetone (1:5400) with alkaline hypochlorite solns. (228) (230) (231) cf. (1) (214) or by electrolysis of alkali chloride in aq. acetone (232) (233) (234) see

indic. refs. For formn. of C from various chlorinated ketones by action of alkali hypochlorites (haloform reaction) see (235) (236).]

From alcohols. [For concise reviews of prepn. of \bar{C} from EtOH (1:6130) by action of alkaline hypochlorite solns. see (1) (214); for formn. of \bar{C} from various other primary and secondary alcohols in similar fashion see (237).]

From miscellaneous sources. [For prepn. of \bar{C} from trichloroacetic acid (3:1150) by loss of CO_2 under a wide variety of conditions see text of that compound under decarboxylation; from dichloroacetyl chloride (3:5290) on warming with AlCl₃ see text of that compound; from mixtures of salts of fatty acids with inorganic chlorides by electrolysis see (238); from lignin with alkali hypochlorite see (239).]

[For prepn. of trichlorodeuteriomethane (deuteriochloroform) (CDCl₃) from chloral deuterate + NaOD (443) or from chloral (3:5210) + D₂O + CaO (444) see indic. refs.; for rate of isotopic exchange between \bar{C} and D₂O see (445).]

CHEMICAL BEHAVIOR OF C

Pyrolysis of Č. [C̄ passed at red heat over asbestos (240), over Pt wire at 1000° (241), with 1% I₂ over pumice at red heat (242) cf. (243), or in electric arc (249) undergoes decomposition, and various proportions of carbon, HCl, hexachloroethane (3:4835), hexachlorobenzene (3:4939), tetrachloroethylene (3:5460), pentachloroethane (3:5880), and other products are claimed to result. C̄ over htd. TiO₂ gives (245) HCl + CO + hexachlorobenzene (3:4939) + TiCl₄. For other studies of pyrolysis of C̄ at 368-400° (246), at 425° (247), and at 512° (248) see indic. refs.]

Oxidation of C. C is readily oxidized to carbonyl chloride (phosgene) (3:5000) by air, oxygen, ozone, or chemical oxidizing agents. In view of the extremely toxic character of phosgene, and of the extensive use of C in anesthesia, this aspect is of great importance and has been very extensively studied.

By air or oxygen. [For an extensive account of the earlier literature on the oxidation of $\bar{\mathbb{C}}$ in air and light see (250). Note that such oxidation is not effected by air in absence of light, nor by light in absence of air (251). $\bar{\mathbb{C}}$ with limited air in sunlight reacts according to the following equation: $\mathrm{CHCl_3} + \mathrm{O} \to \mathrm{COCl_2}$ (3:5000) + HCl (252) but with excess air in sunlight in sense $\mathrm{2CHCl_3} + \mathrm{5O} \to \mathrm{2CO_2} + \mathrm{3Cl_2} + \mathrm{H_2O}$ (252). Note that $\bar{\mathbb{C}}$ + air over dry KOH gives (253) some phosgene (3:5000). For later studies on the photochemical oxidation of $\bar{\mathbb{C}}$ (254) in tropical sunlight (255), including search for possible intermediate peroxides (256) (257), see indic. refs. For studies on chlorine-sensitized photochem. oxidn. of $\bar{\mathbb{C}}$ see (258) (259) (260). For oxidn. of $\bar{\mathbb{C}}$ by atomic oxygen see (261). The photochem. oxidn. of $\bar{\mathbb{C}}$ is repressed by various inhibitors of which EtOH has been most extensively studied (262).]

By ozone. [\bar{C} dissolves ozone yielding a blue soln. in which some \bar{C} is gradually oxidized (270) (271) to phospene; for study of \bar{C} as ozonization solvent see (24).]

By other chemical means. [\bar{C} with ClSO₃H at 120° (263), with K₂Cr₂O₇ + H₂SO₄ (264), or with air over CuO at 350-550° (265) gives phosgene (3:5000). Note, however, that \bar{C} with conc. H₂SO₄ above 200° gives (266) (267) CO + CO₂ + HCl + SO₂ while \bar{C} with an equimolal mixt. of H₂S₂O₇ + SO₃ at 55-60° as directed (268) cf. (269) reacts in sense CHCl₃ + H₂S₂O₇ + SO₃ \rightarrow CO + 3ClSO₃H with S₂O₅Cl₂ (pyrosulfuryl chloride) being formed using more SO₃, and H₂SO₄ using less SO₃.]

Inflammability of \tilde{C} . [For studies of inflammability of \tilde{C} in air, oxygen, or O_2/N_2O mixts. see (272) cf. (273).]

Reduction of \tilde{C} . [\tilde{C} with Zn + alc. HCl (274), Zn + AcOH (275), Zn dust + alc. NH₃ (276) (277) (278), Al/Hg + aq. (275), Fe + AcOH (275), or Si₃H₃ + AlCl₃ in abs. of air

(279) gives CH_2Cl_2 (3:5020) or further reduction products, e.g., CH_3Cl (3:7005) or CH_4 (280); \bar{C} with conc. HI on htg. gives (281) CH_2I_2 [Beil. I-71, I_1 -(18), I_2 -(37)]; \bar{C} with atomic hydrogen gives (282) CH_3Cl (3:7005) + HCl.]

Substitution of C. Note that the text of this section refers only to replacement of the single hydrogen atom of CHCl₃.

Fluorination. [The product of replacement of the H atom of \bar{C} by F (289), viz., trichlorofluoromethane, CCl₃F [Beil. I-64], is usually prepd. by indirect means from sources other than \bar{C} , e.g., from CCl₄ (3:5100) + F₂ in pres. of As + Br₂ (283). However, beyond noting a few leading articles on its physical consts., including b.p. = 23.66° (284), 23.77° (285) at 760 mm., m.p. = -110.48° (284), vapor press. (284) (285), liquid density (286), and P/V/T relationships (287), no complete review of CCl₃F and its relatives (cf. (288)) can be given here.]

Chlorination. \bar{C} on suitable chlorination yields CCl₄ (3:5100). [E.g., \bar{C} with Cl₂ in sunlight (290) or u.v. light (291) (292) (293) (294), at 260-320° (295), or in pres. of FeCl₃ (296) or of aq. (297), or \bar{C} with ICl at 165° (298), or \bar{C} with aq. NaOCl (reaction very slow and incomplete (299)) gives CCl₄ (3:5100). Note, however, that \bar{C} is not chlorinated with SO₂Cl₂ even in presence of organic peroxides (200).

Bromination. \bar{C} on suitable bromination gives bromotrichloromethane. [E.g., \bar{C} with Br₂ in s.t. (301) (298) at 225-275° for 14 hrs. as directed (302), or \bar{C} with Br₂ in light of 5460 Å (303) or 2650 Å in pres. of O₂ (304), or over carbon at 180-350° (305), or \bar{C} with aq. NaOBr (299), gives CCl₃Br [Beil. I-67, I₂-(31)], b.p. 105° (302), 104.2-104.35° at 758.5 mm. (308), m.p. -21° (302). For prepn. of CCl₃Br from trichloroacetyl bromide by pyrolysis at 400° at ord. press. see (306); for studies of behavior of CCl₃Br with Cl₂ in light (307) (308) or of its halogen-sensitized photochem. oxidn. (309) see indic. refs.]

Iodination. [C with aq. NaOI (299) gives iodotrichloromethane, CCl₃I [Beil. I-71], b.p. 142° (299) (310); for prepn. of this prod. from CCl₄ (3:5100) with AlI₃ in CS₂ (310) or from trichloroacetyl iodide by distn. at ord. press. (306) see indic. refs.]

Nitration. [\bar{C} with HNO₃ in s.t. at 90–100° for 120 hrs. (311) or in boilg. acetyl nitrate (312) gives nitrotrichloromethane (chloropicrin) [Beil. I-76, I₁-(20), I₂-(41)], b.p. 111–112°, but this product is usually prepd. by other means, e.g., from calcium picrate with Ca (OCl)₂ (313) (314).]

Nitrosation. [No record can be found of any reaction between chloroform and nitrous acid. However, nitrosotrichloromethane [Beil. I₂-(39)] has been obtd. indirectly from sodium trichloromethane sulfinate, CCl₃-SOONa, by the action of HNO₃ (315) (316). It is a dark blue liq., b.p. 5.0-5.5° at 70 mm. (315), but decomposing on distn. at ord. press. The compound is of considerable interest because on reduction with H₂S (315), Al/Hg (315), SnCl₂ (316), or SO₂ (316) it yields dichloroformaldoxime, Cl₂C—NOH, a chemical warfare agent with especially terrifying characteristics.]

Hydrolysis of \tilde{C} . \tilde{C} on hydrolysis gives formic acid (1:1005) in such a form that the reaction mixt. is able to reduce Fehling soln. or NH₄OH/AgNO₃ even at room temp. or more rapidly on warming (dif. from CCl₄ (3:5100), 1,2-dichloroethane (3:5130), 1,1,2,2-tetrachloroethane (3:5750) and hexachloroethane (3:4835)). Note that, although some CO has been detected, yet formaldehyde (1:0145) is not produced (317).

[\bar{C} with aq. on protracted htg. in s.t. at 225° gives (318) HCOOH (1:1005) + CO + HCl. — \bar{C} with aq. caustic alkali on htg. gives salts of HCOOH (1:1005) (319) accompanied by CO (320) (321) (322); for studies on kinetics of hydrolysis of \bar{C} in aq. alc. in light from Hg vapor lamp see (323).]

 $[\bar{C}]$ is also hydrolyzed in alc. alk. solns. even more readily than CCl₄ (3:5100) (324) (191); for use of this principle in estimation of \bar{C} see above under determination of \bar{C} . For study of kinetics of hydrolysis of \bar{C} with alc. KOH (325), with N/10 KOH in 95% alc. at 90°

(326) cf. (327), or with Ba(OH)₂ or TiOH in 50% alc. (328) (327) see indic. refs. Note that Č with alc. KOH is also claimed by one worker (253) to give ethylene.]

[For further details on ability of C to reduce Fehling soln. see (317) (329) (330).]

Behavior of \tilde{C} with inorganic salts. [\tilde{C} with AlCl₃ gives a gummy hygroscopic addn. prod. which with aq. regenerates \tilde{C} (331), but \tilde{C} with AlBr₃ is more or less (yields: 58–90% (332), 100% (333)) converted to bromoform [Beil. I-68, I₁-(16), I₂-(33)], b.p. 149.55° at 760 mm. (334), m.p. 8.05° (334), $D_4^{25} = 2.87757$ (334), $D_4^{20} = 2.89054$ (334), $D_4^{15} = 2.90350$ (334), $n_5^{15} = 1.60088$ (334).]

[\bar{C} with CaI₂ in s.t. at 100° is partially converted (335) to CHI₃, but \bar{C} with aq. KI even in pres. of Cu decomposes yielding (336) CH₄ + H₂ + CO + CO₂.]

[For leading reference on behavior of C with various metal fluorides see (337).]

Behavior of \tilde{C} with metals. [\tilde{C} with alkali or even alkaline-earth metals undergoes explosive decompn. on htg. or even at room temp. if subjected to sufficient mechanical shock. For studies of the explosion of \tilde{C} with alkali metals see (338) (339) (340); for further data on explosions of \tilde{C} with Li, Na, K, Ca, Sr, Ba, and Mg, especially with reference to sensitivity to mechanical shock, see (341). \tilde{C} with molten Na at 260-370° as directed (342) gives $\tilde{C} + H_2 + CH_4$ with smaller amts. of C_2H_6 , C_2H_4 , and C_2H_2 ; for study of \tilde{C} with Na vapor see (343).]

[For study of hazards of behavior of CHCl₃/CCl₄ mixts. with Al or Mg see (344); for extensive study of corrosion of metals by C see (345).]

[Note that C with Mg in boilg. ether does not react, even in pres. of various catalysts (346).]

Behavior of \bar{C} with various organic reactants. With carbon monoxide. $[\bar{C}$ with CO + water vapor above 200° in pres. of suitable cat. as directed is claimed (347) to give acetic acid (1:1010); \bar{C} with CO + AlCl₃ at 150° and 900 atm. for 6 hrs. gives (21% yield (348)) dichloroacetyl chloride (3:5290).]

With hydrocarbons. [Č (excess) with octene-1 (1:8375) in pres. of small amts. (0.02 mole) of dibenzoyl peroxide (or diacetyl peroxide) adds to unsatd. linkage giving (349) 1,1,1-trichlorononane; under similar conditions Č adds to one of the unsatd. linkages of diallyl (1:8045) giving 8,8,8-trichloroheptene-1. — (For other addns. of Č to unsatd. linkages see below).]

[C with C₆H₆ (excess) in pres. of AlCl₃ (350) (351) (352) (353), FeCl₃ (354), chromium powder (355), or Al powder (356) gives triphenylmethane (1:7220); other aromatic hydrocarbons presumably give analogous results but cannot be detailed here.]

With saturated halohydrocarbons. [\tilde{C} (1.2 moles) with EtBr (3.8 moles) + AlCl₃ (0.07 mole) on htg. as directed (357) gives EtCl (3:7015) + 90% yield CHBr₃ (for physical constants see above under behavior of \tilde{C} with inorganic salts (AlBr₃)). — \tilde{C} (1 mole) with MeI (3 moles) + AlCl₃ (0.04 mole) on similar treatment gives MeCl (3:7005) + (95% yield (357)) iodoform, m.p. 119°. — \tilde{C} with CHBr₃ + 5-10% KCl in pres. of moistened AlCl₃ under CO₂ in s.t. at 135° for 14 hrs. undergoes a redistribution reaction giving (358) 17% \tilde{C} + 43% CHCl₂Br + 31% CHClBr₂ + 9% CHBr₃.]

With unsaturated halohydrocarbons. [\bar{C} (3 wt. pts.) with ord. 1,2-dichloroethylene (3:5030) + AlCl₃ (0.25 wt. pt.) stirred with sand for 20 hrs. at 30° (359) cf. (360) (361) (362) gives (yields: 63% (359), 70-75% at 50° (360), 46% at 17° in 22 hrs. (360)) 1,1,2,3,3-pentachloropropane (3:6280).]

[\bar{C} with 1,1,2-trichloroethylene (3:5170) + AlCl₃ at 20° gives (361) (362) 1,1,1,2,3,3-hexachloropropane (3:6460); note that at higher temp., e.g., 50-60°, yield is greatly diminished and several other prods. (361) are formed.]

[\bar{C} (2 moles) with 1,1,2,2-tetrachloroethylene (3:5460) + AlCl₃ (0.2 mole) refluxed 15-20 hrs. gives (85-93% yield (363)) (364) (365) (366) (367) (368) (369) 1,1,1,2,2,3,3-

heptachloropropane (3:0200); for study of equil. of system $\tilde{\mathbf{C}}$ + tetrachloroethylene (3:5460) + unsym.-heptachloropropane (3:0200) see (370).]

With unsaturated nitriles. [\bar{C} with acrylonitrile (vinyl cyanide) in pres. of trimethylbenzyl-ammonium hydroxide at 0-5° for 24 hrs. or solid KOH at 0-5° for 4 hrs. adds to unsatd. linkage giving (11-12% yield (371)) (372) γ, γ, γ -trichloro-n-butyronitrile, m.p. 41°, b.p. 214-216° at 760 mm., 90-95° at 12 mm. (371) (372).]

With alcohols or alcoholates. [Č with MeOH over cat. at 200-350° gives (373) MeCl (3:7005); Č with EtOH under similar conditions gives (373) EtCl (3:7015).]

[C with Na alcoholates gives the corresp. trialkyl orthoformates. E.g., C with NaOCH₃ gives (374) (375) trimethyl orthoformate (1:3087); C with NaOC₂H₅ gives (27-31% yield (376), 36% (377)) (374) (375) triethyl orthoformate (1:3241); orthoformate esters of higher ales. are similarly prepd. cf. (374) (377). For study of behavior of C with mixts. of sodium alcoholates see (378); for treatise on chemistry of aliphatic orthoesters see (379).]

With mercaptans or mercaptides. [\bar{C} with NaSCH₃ should yield trimethyl trithioorthoformate [Beil. II₁-(39)], m.p. 16° (380), b.p. 220° dec. (380), 103-104° at 12 mm. (381), 96° at 9 mm. (380), n_D^{15} = 1.5696 (381), but this prod. has been reported only by other means, e.g., from CCl₄ (3:5100) with NaSCH₃ (381) and from anhydrous HCOOH (1:1005) with CH₃SH in s.t. at ord. temp. (380).]

[\bar{C} with NaSC₂H₅ gives (382) (383) (386) triethyl trithioorthoformate [Beil. II-95, II₁-(39)], b.p. 235° dec. (380), 174° at 760 mm. (384), 136.5° at 23 mm. (385), 133° at 21 mm. (386), 126.5-128° at 12 mm. (381), 127-128° cor. at 12 mm. (387), $D_4^{20} = 1.053$ (386), $n_D^{15} = 1.5410$ (381), but this product is usually prepd. by indirect means, e.g., from anhydrous HCOOH (1:1005) with C₂H₅SH in pres. of dry HCl (384) (385) or from CCl₄ (3:5100) with NaSC₂H₅ (381).]

With phenols or phenolates. \vec{C} with phenols (or with substituted phenols having at least one free ortho or para position) in presence of aq. alk. condenses with eventual introduction of the formyl radical and formn. of phenolic aldehydes (Reimer-Tiemann reaction (388)). The countless recorded examples of this reaction cannot be detailed here but the following leading references will be found useful. [For modern studies of the Reimer-Tiemann reaction see (389) (390); for studies of influence of substituents in the phenolic component see (391) (392) (393) (394) (395); for extension of the Reimer-Tiemann reaction to other classes such as substituted indoles (396), thiazoles (397) see indic. refs.; for application to β -naphthol (1:1540) giving (38-48% yield (398)) 2-hydroxy-1-naphthaldehyde, m.p. 79-80°, to β -tetralol (5,6,7,8-tetrahydronaphthol-2) (399) see indic. refs.; for studies on theory of Reimer-Tiemann reaction see (400) (401) (402).

[\bar{C} with dry KOC₆H₅ at 110° for 4 hrs. under N₂ gives (15% yield (403)) triphenyl orthoformate [Beil. VI-152, VI₂-(153)], ndls. from alc., m.p. 76-77° (404), 75° (403), 71.5° (405); note that this prod. is also formed (405) in the Reimer-Tiemann reaction of. (390).]

With aldehydes or ketones. \bar{C} with aromatic (but not aliphatic (406)) aldehydes in pres. of aq. KOH undergoes addition yielding trichloromethyl-aryl-carbinols. [E.g., \bar{C} with benzaldehyde (1:0195) + aq. KOH gives (16% yield (406)) (407) cf. (408) trichloromethylphenyl-carbinol [Beil. VI-476, VI₁-(237), VI₂-(447)], m.p. 37° (409), b.p. 145° at 15 mm. (409) cf. (406) (corresp. acetate, m.p. 87.5° (409); corresp. benzoate, m.p. 97.5° (409); corresp. p-nitrobenzoate, m.p. 109° (410)). For analogous behavior of \bar{C} + alkali with o-chlorobenzaldehyde (3:6410) (411), m-chlorobenzaldehyde (3:6475) (412), p-chlorobenzaldehyde (3:0765) (413), p-tolualdehyde (1:0215) (412), and furfural (1:0185) (406) see indic. refs. Note that trichloromethyl-aryl-carbinols are also obtd. by reaction of arom. hydrocarbons with chloral (3:5210) q.v.]

[\overline{C} with acetone (1:5400) in pres. of dry powdered KOH (0.5 mole) below 0° (414) or 2-3° (415), or KOH in alc. as directed (416), or even NaNH₂ (418) gives (yields: 25% (416),

23% (414)) (417) (415) 1,1,1-trichloro-2-methylpropanol-2 $(\beta,\beta,\beta$ -trichloro-ter-butyl alcohol = "Chloretone") (3:2662) q.v.; note that use of NaOH lowers the yield (414) and that Ca(OH)₂ (416), Zn(OH)₂ (414), or Al(OH)₃ (414) yields no such product; note also that the crude prod. contains some diacetone alcohol (1:6423) best removed by treatment with aq. (416) since otherwise it forms with the "Chloretone" a const.-boilg. mixt.]

[$\ddot{\mathbf{C}}$ (2 moles) with ethyl methyl ketone (1:5405) in pres. of dry powdered KOH (419) or of NaNH₂ (418) gives (13.5% yield (419)) by addition 1,1,1-trichloro-2-methylbutanol-2 [Beil. I₂-(424)], b.p. 162-165° (418), 110-113° dec. at 620 mm. (419), $D_4^{20} = 1.2128$ (419), $D_D^{20} = 1.4460$ (419). Note, however, that analogous addition of $\ddot{\mathbf{C}}$ does not occur with diethyl ketone (1:5420) (420), di-n-propyl ketone (1:5447) (420), ethyl n-propyl ketone (420), methyl isobutyl ketone (1:5430) (420), or methyl phenyl ketone (acetophenone) (1:5515) (419), but will occur to a very small extent with cyclopentanone (1:5446) (421) or cyclohexanone (1:5465) (421) cf. (418).]

With amines. C with primary amines in pres. of alc. caustic alkali condenses with loss of 3 HCl giving the corresp. isocyanides whose extremely characteristic odor has caused this general procedure to be used as a test (422) for primary amines. The reaction has, however, been very little studied in the aliphatic series.

[\bar{C} with CH₃NH₂ + alc. NaOH should give methyl isocyanide (methyl carbylamine) [Beil. IV-56, IV₁-(328), IV₂-(561)], b.p. 59.6° at 760 mm. (423), 59-60° (424), $D_4^{20} = 0.734$ (424), $D_4^{20} = 0.7464$ (425), $n_{He}^{20} = 1.343$ (424), but this highly explosive (425) (426) (427) substance has been reported only by other means, e.g., from MeI with dry AgCN (425) (423), CuCN (428), or CH₃HgI (429). — \bar{C} with C₂H₅NH₂ + alc. NaOH gives (430) ethyl isocyanide (ethyl carbylamine) [Beil. IV-107, IV₁-(351), IV₂-(600)], b.p. 78.1° at 760 mm. (431), 78° (424), $D_4^{20} = 0.747$ (424), $D_4^{20} = 0.7405$ (425), $n_{He}^{20} = 1.362$ (424), but this less explosive prod. (427) is usually obtd. by other means, e.g., from EtI with AgCN (425) (431), etc. — \bar{C} with n-BuNH₂ + aq. NaOH gives (only 5% yield (432)) n-butyl isocyanide (n-butyl carbylamine) which is better obtd. (40% yield (432)) from n-BuI + AgCN.]

[Č with aniline in alc. KOH (433) (435) cf. (438) or in C_6H_6 + NaNH₂ (436), or better in MeOH/NaOH (50% yield (434)) or powdered KOH without solvent (35–40% yield (437)) cf. (438), gives phenyl isocyanide (phenyl carbylamine) [Beil. XII-191, XII₁-(168)], b.p. 165–166° at ord. press. with partial polymerization (435), 78° at 40 mm. (435), 64° at 20 mm. (435), $D_4^{18.1} = 0.9823$ (424), $n_{\rm He}^{13.1} = 1.52828$ (424). — For analogous reactions of Č with ρ -toluidine giving ρ -tolyl isocyanide [Beil. XII-788], b.p. 183–184° cor. at 753 mm. (439), with ρ -toluidine giving (440) (441) ρ -tolyl isocyanide [Beil. XII-903], b.p. 99° at 32 mm. (441), 94° at 25 mm. (434), m.p. 21° (441), 19.5° (434), with ρ -methoxyaniline (ρ -anisidine) giving ρ -methoxyphenyl isocyanide, b.p. 112° at 16 mm. (438), with ρ -phenylenediamine to give (442) either ρ -aminophenyl isocyanide, m.p. 74°, or ρ -phenylenediisocyanide see indic. refs. — Many other isocyanides are known but cannot be detailed here.]

Color reaction with α-naphthol/cyclohexanol. A. C (1'drop) with 2 ml. of a 2% soln. of α-naphthol (1:1500) in cyclohexanol (1:6415) + 1 pellet of solid NaOH, boiled 25 seconds and cooled, gives (174) blue color; one portion of this blue soln. underlaid with equal vol. of 85% H₂SO₄, stood 1 minute and shaken turns intensely blue; a second portion of the alkaline blue soln. acidified with equal vol. of AcOH (1:1010) stood 1 minute and shaken becomes orange-yellow. [Note that the alkaline boiling also gives a blue color with CH₂Cl₂ (3:5020) and with CCl₄ (3:5100) while other chlorinated solvents (174) give yellow-brown, gray, or brown; in the H₂SO₄ treatment CH₂Cl₂ (3:5020) gives greenish-blue and CCl₄ (3:5100) a red, color.]

- B. C (1 drop) with 2 ml. cyclohexanol (1:6415) + a few mgms. α -naphthol (1:1500) + 2 ml. 20% aq. KOH boiled 15 seconds with vigorous shaking gives (175) blue color in upper layer. [Neither CH2Cl2 (3:5020) nor CCl4 (3:5100) gives any color, and this form of the test may be used to detect as little as $1\%\ \bar{\mathrm{C}}$ in either of the other two.]
- P Color test with 2,7-dihydroxynaphthalene/cyclohexanol. C (1 drop) with 2 ml. pure cyclohexanol (1:6415) + 1 pellet NaOH + a few mgms. 2,7-dihydroxynaphthalene htd. at 197° (b.p. of ethylene glycol) for 45 seconds, decanted from undissolved NaOH, cooled, and shaken with 2 ml. AcOH + 4 ml. 96% EtOH, gives deep red color (175). [Note that under these conditions CH₂Cl₂ (3:5020) gives a steel-blue color while CCl₄ (3:5100) gives pale yellow-brown color (175).]
- **P** Color test with cyclopentanol. \tilde{C} (1 drop) in 1 ml. cyclopentanol (1:6412) + 1 pellet NaOH boiled for 25 seconds, then shaken vigorously for 35 seconds, then treated with 4 ml. 96% EtOH and shaken, gives with C only a pale citron-yellow color (175). [Note that in this test CH₂Cl₂ (3:5020) gives a deep red color which intensifies or turns reddish-brown upon addition of EtOH; CCl4 (3:5100) gives an intense brown color.l

3:5060 OXALYL (DI)CHLORIDE
$$O=C-C1$$
 $C_2O_2Cl_2$ Beil. II - 542 II_1 -(234) II_2 -(508)

B.P. M.P.
$$-10.0^{\circ}$$
 (3) $D_4^{20} = 1.4785$ (3) $n_D^{20} = 1.4316$ (3) $62.1-62.3^{\circ}$ (2) -12.0° (1) 1.480 (4) 1.4301 (4) 61.1° at 743 mm. (3) $D_4^{13.4} = 1.4484$ (4) $D_4^{12.9} = 1.4888$ (4) $n_D^{12.9} = 1.43445$ (4) 1.43395 (4) 1.43395 (4)

[See also ethoxalyl chloride (3:5625).]

Colorless liq. whose vapors strongly attack respiratory passages. — Solns. of \bar{C} in ether, CHCl₃, or alkanes are colorless, but those in phenol, anisole, thioethers, piperonal, and dipentene are yellow (5). — Note that the presence in samples of \bar{C} of phosphorous compds.

(such as might remain from the reagts, used in its prepn.) increases the refractive index (4); such contaminants may be removed by treatment with Cl_2 and subsequent fractionation (4) (7). — \bar{C} is stable to fumg. H_2SO_4 .

 \bar{C} is an important reagent in organic synthesis; its reactions may conveniently be classified under four main types, viz.: (A) those in which it reacts as an acid chloride (either one or both groups being involved); (B) those in which it acts like a mixture of $COCl_2$ (3:5000) + CO; (C) those in which it acts as a chlorinating agent; and (D) those in which it acts as a dehydrating agent. Examples of all these types will be found in the subsequent text, but naturally combinations of the distinctive types may occur simultaneously.

 $\bar{\mathbf{C}}$ is also employed in the preparation of various dyestuffs although these cannot be discussed here. [For toxicity of $\bar{\mathbf{C}}$ see (6); for protection of stopcocks from action of $\bar{\mathbf{C}}$ see (16).]

Preparation. [For prepn. of \bar{C} from anhydrous oxalic acid (1:0535) with PCl₅ (2 moles) (yields: 70% (8), 45–50% (1)) in pres. of an inert solid or liq. diluent (9) and even in units as much as 5 times the original (10), or with PCl₃ in POCl₃ in stream of Cl₂ (11), or with COCl₂ (3:5000) in pres. of tertiary amines (14) see indic. refs.; from dicthyl oxalate (1:1055) with PCl₅ (poor yields) see (12) (1) (13).]

[For prepn. of \bar{C} from COCl₂ (3:5000) + CO, or from CO + Cl₂ over suitable cat. at 200-400° and 200 atm. press., see (15).]

[For form. of \tilde{C} (19% yield (1)) from ethoxalyl chloride (3:5625) with PCl₅ in s.t. at 170° see (1).]

Pyrolysis or decomposition of \bar{C} . $[\bar{C}$ on passing through tube at 600° (1) or on htg. at 340° for 70 hrs. in an evacuated s.t. (7) dec. quant. into COCl₂ (3:5000) and CO; note, however, that at 200° \bar{C} shows no trace of phospene even after 18 hrs. (7) and at ordinary temp. (when protected from light and moisture) can be preserved indefinitely.]

 \overline{C} (1 mole) on slight warming with AlCl₃ (2 moles) in CS₂ dec. quant. (1) into phosgene (3:5000) + CO and may thus serve as a source of COCl₂ in Friedel-Crafts reactns. (see below).

C when exposed to light of any wave length below 3800 Å slowly dec., the final prods. being COCl₂ (3:5000) + CO although the initial prods. appear to include Cl₂ and CO (16); this photochemical decn. plays an important part in its use as a reagent for introduction of the —CO.Cl group (chloroformylation) (see below).

Behavior of \tilde{C} with inorganic reactants. \tilde{C} with liq. aq. or dil. aq. alk. yields quant. (1) CO + CO₂ + HCl, no trace of oxalic acid (1:0445) or of its semi-acid chloride being formed; however, \tilde{C} as vapor on treatment with steam does yield also some oxalic acid crystals (1).

 $[\bar{C}]$ in ether on treatment with dry H₂S for several hrs. is unchanged, but if quinoline (2 moles) is added, vigorous reactn, occurs (1) with evolution of gaseous CO + COS.]

[\bar{C} on treatment with HBr gas for 12 hrs. gives (85% yield (7)) (17) (18) oxalyl (di)bromide [Beil. II₁-(236), II₂-(509)], b.p. 106° (18), 102-103° at 720 mm., 16-17° at 10 mm., f.p. -19.5° (7) (for study of thermal and photochemical decn. of this prod. see (18)). — \bar{C} with HI is reduced (7) yielding CO + I₂ (cf. phosgene (3:5000)).]

 \bar{C} with 2 NaI in dry acetone yields quant. (41) CO + I₂ + 2NACl but \bar{C} with aq. NaI does not set free iodine giving instead the usual aqueous hydrolysis with formn. of CO + CO₂ + 2HCl (41).

[\overline{C} (2 moles) with As₂O₃ (1 mole) gives (95% yield {19}) AsCl₃, b.p. 130°; similarly \overline{C} with dry CrO₃ refluxed 5 hrs. gives (80% yield {19}) chromyl chloride, CrO₂Cl₂, b.p. 114–116° at 748 mm.]

 $[\tilde{C} \text{ in } C_6H_6 \text{ with } H_2 \text{ in pres. of Pd/BaSO}_4 \text{ cat. gives only gaseous products, no trace of glyoxal or glyoxylic acid being formed (20).]}$

 $\ddot{\mathbf{C}}$ in $\mathbf{C_6H_6}$ with NH₃ gas in cold reacts vigorously yielding (21) oxalic acid diamide (oxamide) [Beil. II-545, II₁-(237), II₂-(509)], m.p. above 400° (and therefore useless as derivative for identification), + NH₄Cl. — $\ddot{\mathbf{C}}$ with hydrazine hydrate (excess) presumably yields oxalic acid dihydrazide ("oxalhydrazide") [Beil. II-559, II₁-(243), II₂-(514)], m.p. 244° dec., although this method of prepn. seems to be unreported.

 $[\bar{C} \text{ with K/Na alloy is (like many halogen compds.) sensitive to detonation by mechanical shock (GREAT DANGER) cf. (22). — For behavior of <math>\bar{C}$ with other metals see (7).]

Behavior of \bar{C} with organic reactants. Reaction of \bar{C} with alkanes and cycloalkanes. [C with satd. aliphatic hydrocarbons and with cycloparaffins in pres. of light and peroxides reacts to replace 1 H atom by the —CO.Cl group (22) (10); since this group represents the radical corresponding to the unisolatable acid chloride of formic acid, the process might well be designated as "chloroformylation"; however, since the resultant prods. may readily be hydrolyzed to the corresp. carboxylic acids, the process has also (unfortunately) been designated as "carboxylation." - E.g., C (1 mole) with cyclohexane (1:8405) (2 moles) + dibenzoyl peroxide (0.005 mole) refluxed for 24 hrs. in light from low-press. Hg vapor lamp (10) or 300-watt tungsten lamp (23) gives (yields: 85% (23), 65% (10)) cyclohexanecarboxylic acid chloride (hexahydrobenzoyl chloride) (3:8580). — Note that neither simple olefins such as 2-methylbutene-2 (1:8220), octene-1 (1:8375), hexadecene-1 (cetene) (1:7000), nor cycloalkenes such as cyclohexene (1:8070) undergo this type of reactn. (24), although phenylethylene (styrene) (1:7435) gives cinnamoyl chloride (3:0330) (9% yield of cinnamic ac. after hydrolysis (24)) and phenylacetylene (1:7425) gives β -chlorocinnamoyl chloride (16% yield of β -chlorocinnamic acid after hydrolysis (24)). — Note also that C under similar conditions with aralkyl hydrocarbons chloroformylates the side chain but yields are very low (5-10%) (25)

Reactions of \tilde{C} with aromatic hydrocarbons. [\tilde{C} with aromatic hydrocarbons (R.H.) in pres. of AlCl₃ shows both (A) and (B) types of reactn. mentioned above in 2nd paragraph; on one hand (A) \tilde{C} reacts like phosgene yielding R.CO.Cl (which during the usual subsequent treatment is hydrolyzed to the corresp. acid) and ketones of the type R₂CO; on the other (B) \tilde{C} reacts with 2 PH as a bifunctional acid chloride yielding the corresp. 1,2-diketones, which with some of the polycyclic hydrocarbons comprise new cyclic systems of the quinone type. Examples of these various combinations are listed below.]

[\bar{C} with $C_6H_6+AlCl_3$ in CS_2 gives according to mode of procedure either (1) 100% yield benzoyl chloride (3:6240) or 89% yield diphenyl ketone (benzophenone) (1:5150); note that no benzil (dibenzoyl) (1:9015) is formed here although it has been obtd. (in small proportion) together with benzophenone from oxalyl (di)bromide with $C_6H_6+AlBr_3$ in CS_2 (17). — \bar{C} with toluene + AlCl₃ in CS_2 gives (65% yield (26)) p-toluic acid (1:0795). — \bar{C} with o-xylene (1:7430) + AlCl₃ in CS_2 gives (75–80% yield (27)) (26) 3,4-dimethylbenzoic acid [Beil. IX-535, IX₁-(210)], m.p. 166°, accompanied by some 3,4,3',4'-tetramethylbenzil (4,4'-o-xylil), m.p. 128.5° cor. (27); \bar{C} with m-xylene (1:7420) similarly gives (40–50% yield (26)) 2,4-dimethylbenzoic acid [Beil. IX-531, IX₁-(290)], m.p. 126°; \bar{C} similarly with p-xylene (1:7415) gives (100% yield (26)) 2,5-dimethylbenzoic acid [Beil. IX-534, IX₁-(210)], m.p. 132°. — \bar{C} with ethylbenzone (1:7410) gives (29) p-ethylbenzoic acid [Beil. IX-529], m.p. 112°.]

[\bar{C} with arom. hydrocarbons contg. two uncondensed benzene nuclei shows a distinct tendency to yield dicarboxylic acids despite the fact that the first member is exceptional. E.g., \bar{C} with biphenyl (1:7175) + AlCl₃ in CS₂ gives (30) 40% yield di-p-xenyl ketone, m.p. 236°, + 25% p-xenil, m.p. 140-141°, although the formation in 75% yield of p-phenyl-benzoic acid (p-xenoic acid) [Beil. IX-671, IX₁-(280)], m.p. 224°, has also been reported (31); for examples of dicarboxylic acid formn. from \bar{C} + AlCl₃ with 2,2'-dimethylbiphenyl (26), diphenylmethane (32), phenyl p-tolylmethane (26), di-p-tolylmethane (26), α,β -

diphenylethane (bibenzyl) (32), α,β -diphenylethylene (stilbene) (32), triphenylmethane (32), see indic. refs.]

[$\bar{\mathbf{C}}$ with polycyclic arom. hydrocarbons frequently, but not always, also gives polycyclic quinones; e.g., $\bar{\mathbf{C}}$ with naphthalene (1:7200) + AlCl₃ in CS₂ gives (35) a mixt. of α -naphthoic acid (1:0785) + β -naphthoic acid (1:0800); $\bar{\mathbf{C}}$ with 2-methylnaphthalene (1:7605) + AlCl₃ in CS₂ gives (33) a mixt. of acids + 2,2'-dimethylnaphthil + 3-methylacenaphthene-quinone-1,2; for analogous results with 1,6-, 2,6-, and 2,7-dimethylnaphthalenes see (33) (34); $\bar{\mathbf{C}}$ with anthracene + AlCl₃ in CS₂ gives (70% yield (35)) aceanthrenequinone (1,9-oxalylanthracene) [Beil. VII₁-(436)], red pr. from C₆H₆, m.p. 270°, accompanied by some anthracene-9-carboxylic acid (meso-anthroic acid).]

[For behavior of \bar{C} + AlCl₃ with 2-methylanthracene (36) (38), 1,2-dibenzanthracene (37), retene or dihydroretene (39), or fluoranthene (40) see indic. refs.; many analogous cases are known but cannot be included here.]

Reaction of \bar{C} with alcohols and thiols. [\bar{C} with 2 moles primary alcs. especially in pressof pyridine yields corresp. neutral esters: e.g., \bar{C} with MeOH (1:6120) (2 moles) gives dimethyl oxalate (1:0415), m.p. 54°; \bar{C} with EtOH (1:6130) (2 moles) gives diethyl oxalate (1:1055), b.p. 185°; for analogous behavior of \bar{C} with n-propyl alc. (1:6150) yielding di-n-propyl oxalate (1:3726), with isobutyl alc. (1:6165) yielding di-isobutyl oxalate (1:3897), with isoamyl alc. (1:6200) yielding disoamyl oxalate (1:4181) all in 100% yield see (42). — \bar{C} with secondary alcs. (2 moles) also yields (42) (50) the corresp. neutral esters, but yields are less satisfactory and the ability of \bar{C} to act as a dehydrating agent begins to become evident (42); c.g., \bar{C} with methyl-phenyl-carbinol (1:6475) yields no ester, but only phenylethylene (styrene) (1:7435). — \bar{C} with tertiary alcs. replaces OH by Cl; e.g., \bar{C} with ter-butyl alc. (1:6140) gives ter-butyl chloride (3:7045); \bar{C} with triphenylcarbinol (1:5985) gives chlorotriphenylmethane (3:3410) (42).]

[Note that \bar{C} with only 1 mole of primary alcs. yields the corresponding half esterification prods.; e.g., \bar{C} (1 mole) with EtOH (1:6130) (1 mole) gives (60% yield (43)) ethoxalyl chloride (3.5625); for other examples together with use of such oxalic ester chlorides in prepn. of cellulose esters see (43).]

[C with ethylene glycol (1:6465) (1 mole) directly (42) or in pyridine (44) or in dry ether (45) gives (57% yield (45)) monomeric ethylene glycol oxalate (2,3-dioxodioxane-1,4) [Beil. XIX-153, XIX₁-(679)], m.p. 143° (45), 149° (44), 153° (42); for relationships of this monomer to the polymeric forms see (46).]

[\bar{C} with CH₃SH (2 moles) (13) in dry ether (47) gives dimethyl dithioloxalate [Beil. II-565, II₂-(514)], yel. cryst. from ether or lgr., m.p. 82.5-83.5° (13), 80° (47), b.p. 218° at 760 mm. (47). — \bar{C} with EtSH (2 moles) (13) (48) in dry ether (1) gives diethyldithioloxalate [Beil. II-565, II₁-(244)], m.p. 27-27.5° (13), 24-25° (1), b.p. 238-240° at 757 mm. (1), 235° (13).]

Behavior of \bar{C} with phenols and thiophenols. [\bar{C} (1 mole) with phenol (2 moles) in dry ether with metallic Na (2 moles) gives (21% yield (49)) diphenyl oxalate [Beil. VI-155, VI₁-(87)], m.p. 134° u.c. (49). — \bar{C} (1 mole) with σ -cresol (1:1400) (2 moles) + Na similarly gives (49) di- σ -otolyl oxalate [Beil. VI-355], ndls. from alc., m.p. 90-91° u.c. (49); \bar{C} with σ -cresol (1:1730) similarly gives (49) di- σ -tolyl oxalate [Beil. VI-379, VI₁-(187)], ndls. from alc., m.p. 105° u.c. (49); \bar{C} with σ -cresol (1:1410) similarly (49) or in pyridine (51) gives di- σ -tolyl oxalate [Beil. VI-398, VI₁-(201)], pl. from alc. + ether, m.p. 148° (49), 147° (51); for similar behavior of still other phenols see (51).]

[Note, however, that \tilde{C} (1 mole) with phenols (1 mole) in pres. of AlCl₃ leads to monoesterification followed by elimination of HCl and ring closure; e.g., \tilde{C} (1 mole) with β -naphthol (1:1540) + AlCl₃ in CS₂ gives (85% yield (52) (53)) 4,5-benzocumarandione-2,3 [Beil. XVII₁-(267)], orange ndls. from AcOH, m.p. 180-181° (52).]

[For behavior of \bar{C} with resorcinol (1:1530) + Na or K in moist ether see (54).]

[\bar{C} with β -thionaphthol (2-mercaptonaphthalene) + AlCl₃ in CS₂ esterifies and ringcloses with loss of HCl yielding (55) 4,5-benzothiocumarandione-2,3 (4,5-benzothionaphthenequinone-2,3), red pdr., m.p. 153°. — For extension of this type of reactn. to prepn. of halogenated thionaphthisatins from \bar{C} with halogenated 1- or 2-mercaptonaphthalenes + AlCl₃ see (56+.]

[For behavior of C with dithiopyrocatechol (o-dimercaptobenzene) see (57).]

[For study of a series of molecular cpds. of C with various hydroxy-azo compds. see (58). Behavior of C with phenol ethers. [C with mononuclear phenol ethers + AlCl3 reacts in general according to types A and B of paragraph 2 (above) so that after aqueous treatment involved in destroying the AlCl₃ there results either a diketone or a carboxylic acid; which of these is formed or their proportion varies with nature of components and with conditions. E.g., C (1 mole) with ansole (methyl phenyl ether) (1:7445) (2 moles) + AlCl₃ (2 moles) in CS₂ gives (yields: 90% (59), 80% (60), 76% (17)) anisil (4,4'-dimethoxybenzil) [Beil. VIII-428, VIII₁-(705)], golden-yel. ndls. from alc., m.p. 133° (60), 132° (59); C (1 mole) with phenetole (ethyl phenyl ether) (1:7485) (2 moles) + AlCl₃ in CS₂ gives (80% yield (29)) phenetil (4,4'-diethoxybenzil), pr. from ether + alc., m.p. 149°; \overline{C} similarly with o-cresol methyl ether (1:7480) + AlCl₃ in CS₂ gives (76% yield (61)) (59) 4,4'-dimethoxy-3,3'-dimethylbenzil, pale yel. ndls. from AcOH, toluene, or pyridine, m.p. 177° (61), 174° (59). — Note, however, that \bar{C} with m-cresol methyl ether (1:7510) + AlCl₃ in CS₂ yields no diketone, but only (59) 2-hydroxy-6-methylbenzoic acid (6-methylsalicylic acid) [Beil. X-217, X₁-(95)], m.p. 168°; C with p-cresol methyl ether (1:7495) gives no diketone but only (12% yield (59)) 2-hydroxy-5-methylbenzoic acid (5-methylsalicylic acid) [Beil. X-227, X₁-(98)], m.p. 149° (59). — Many analogous cases of each type are known but cannot be included here.]

[\bar{C} with pyrocatechol dimethyl ether (veratrole) (1:7560) + AlCl₃ gives (60) 2,3,2',3'-tetramethoxybenzophenone; \bar{C} with resorcinol dimethyl ether (1:7570) gives (60) 2,4,2',4'-tetramethoxybenzophenone; \bar{C} with hydroquinone dimethyl ether (1:7160) gives (60) 2,5,2',5'-tetramethoxybenzophenone, but \bar{C} with orcinol dimethyl ether (3,5-dimethoxytoluene) + AlCl₃ gives (29) by ring closure 6-methoxy-4-methylcoumarandione-2,3, m.p. 165° (29).]

Behavior of \bar{C} with organic acids or their derivatives. [\bar{C} with silver oxalate in dry ether does not yield the unknown oxalic anhydride but instead immediately evolves CO + CO₂ until all the salt has disappeared (1).]

[C with organic acids, their salts, or their anhydrides, gives the corresp. acid chlorides in good yield (19); furthermore under appropriate conditions C with aromatic acids gives good yields (50) of the corresp. arom. anhydrides; for numerous examples see indic. refs.]

Behavior of C with amines or their derivatives. C with primary or secondary amines (2 moles) reacts normally as a bifunctional acid chloride yielding corresp. N-substituted oxamides (see also below under D's).

[Note, however, that with amine salts reaction takes a different course. — E.g., \bar{C} with aniline hydrochloride at 15° evolves HCl and gives (100% yield (62)) oxanilyl chloride, $C_6H_5.NH.CO.CO.Cl$ [Beil. XII-283, XII₁-(206)], pr. from pet. ether, m.p. 82.5°; \bar{C} with α -naphthylamine.HCl in chlorobenzene at 15° similarly yields (12) N-(α -naphthyl)oxamidyl chloride, $C_{10}H_7.NH.CO.CO.Cl$, m.p. 86° (62); \bar{C} with β -naphthylamine.HCl similarly yields (62) N-(β -naphthyl)oxamidyl chloride, ndls. from C_6H_6 , m.p. 114–115° dec. (62). — Note that these prods. with condensing agents such as AlCl₃.FeCl₃ or H_2SO_4 ring-close with loss of HCl to yield homologs of isatin: e.g., N-(α -naphthyl)oxamidyl chloride + AlCl₃ at 80–85° for 8 hrs. gives (63) 6,7-benzoisatin [Beil. XXI-524, XXI₁-(414)] ("1,2-naphthisatin"), red ndls., m.p. 255°; N-(β -naphthyl)oxamidyl chloride with AlCl₃ in

nitrobenzene at 80° gives (75-80% yield (63)) 4,5-benzoisatin ("2,1-naphthisatin") [Beil. XXI-525, XXI₁-(415)], m.p. 252-253°.]

[Note, furthermore, that the above general synthesis of isatin homologs can be carried out starting with N-acylated arom. amines: e.g., \bar{C} with Na salt of N-(p-toluenesulfonyl)-p-toluidide in CS₂ splits out NaCl giving (64) N-(p-toluenesulfonyl)-N-(p-tolyl)oxamidyl chloride, cryst. from C₆H₆, m.p. 91–93° (64); this prod. on htg. with AlCl₃ loses HCl and ring-closes to N-(p-toluenesulfonyl)-5-methylisatin, cryst. from AcOH or C₆H₆, m.p. 202–205°, hydrolysis of which by stdg. 1 day with conc. H₂SO₄ yields (64) 5-methylisatin [Beil. XXI-509, XXI₁-(401)], red ndls. from aq. or alc., m.p. 187°.]

[For analogous reactn. of \tilde{C} with secondary arom, amines and ring closure to N-substituted isatins see (65).]

·[C with N,N-dimethylaniline gives various prods. according to conditions: C (1 mole) with dimethylaniline (2 moles) in dry ether in cold gives (100% yield (66)) (p-dimethylaminobenzoyl) formyl chloride, (CH₃)₂N.C₆H₄.CO.CO.Cl, stable only in soln. and on treatment with aq. giving (80% yield (66)) (p-dimethylaminobenzoyl) formic acid, golden-yel. Ifts. from AcOH or MeOH, m.p. 186–187° dec.; C (1 mole) with dimethylaniline (4 moles) in C₆H₆, stood 15 hrs. in cold, then heated gives tetramethyldiaminobenzil + the carbinol base of "Crystal Violet" (for many further details see (66)); for use of C in prepn. of "Crystal Violet" see (67).]

[C with o-aminothiophenol (80) or with its Zn salt (68) at 60-80° until reactn. begins, then htd. at 100° for 1 hr., gives (60% yield (68)) bis-2,2'-benzothiazolyl [Beil. XXVII-744, XXVII₁-(626)], m.p. 300.5° u.c. (68), 304° (80); similarly C with Zn salt of o-amino-selenophenol gives (69) bis-2,2'-benzoselenazolyl, m.p. 314° u.c. (69).]

Behavior of \bar{C} with certain amides. [\bar{C} with urea directly or in ether gives (8) (21) parabanic acid (N,N')-oxalylurea) [Beil. XXIV-449, XXIV₁-(401)], cryst. from alc., m.p. 244°, accompanied by more or less oxaldiureide, insol.. m.p. 270-275° dec. (8). — \bar{C} with N,N'-dimethylurea gives (70% yield (8)) N,N'-dimethylparabanic acid [Beil. XXIV-453, XXIV₁-(404)], m.p. 154° (8). — \bar{C} with N-phenylurea in ether refluxed 3 hrs. gives (88% yield (8)) N-phenylparabanic acid [Beil. XXIV-454, XXIV₁-(405)], lfts. from alc., m.p. 213-214° cor., after sintering at 208° (8). — \bar{C} with N,N'-diphenylurea in ether gives (100% yield (8)) N,N'-diphenylparabanic acid [Beil. XXIV-455, XXIV₁-(405)], ndls. from alc., m.p. 202° cor., after prelim. sintering (8).]

[For examples of condensation of \bar{C} with various other amides see (21) (70) (71) (73); with various amino acids see (72).]

Behavior of \bar{C} with carbonyl compounds. [\bar{C} with ketones often acts like PCl₅ by replacing the oxygen with 2 chlorine atoms with evolution of CO + CO₂: for many specific examples see (74); also note that \bar{C} with xanthone (1:7275) gives (75) (76) xanthone dichloride; \bar{C} with N-methyl- or N-phenylacridone gives (77) dichlorides.]

Behavior of \bar{C} with organometallic compounds. .[\bar{C} with nickel carbonyl reacts according to equation Ni(CO)₄ + (CO.Cl)₂ \rightarrow NiCl₂ + 6CO (13). — \bar{C} with Et₂Cd (from C₂H₅MgBr + CdCl₂) gives (27% yield (77)) 3-ethylhexanol-3-one-4 (diethyl-propionyl-carbinol) [Beil. I-841, I₂-(881)], b.p. ·178-179° (78). — For interference of \bar{C} with the Michler's ketone test for RMgX cpds. see (79).]

② Oxalyl (di)chloride/1,4-dioxane mol. cpd.: ndls. or pr. from pet. ether, m.p. 67-68° (81). [From C with 5 wt. pts. dioxane-1,4 (1:6400) in 25 vols. pet. ether at −5° in stream of dry air or N₂; the 1:1 mol. cpd. ppts. in 71-78% yield (81). — Note that this prod. may with aniline be converted to oxanilide (see below) or may be dislyd. in excess stand. alk. and titrated back with stand. acid; furthermore, on stdg. in moist air, it is quant. converted to oxalic acid dihydrate (1:0445). — Note also that

- under same conditions no ppt. results with acetyl chloride (3:7065), benzoyl chloride (3:6240), malonyl (di)chloride (3:9030), succinyl (di)chloride (3:6200), fumaryl (di)chloride (3:5875), sym.-phthaloyl (di)chloride (3:6900), unsym.-phthaloyl (di)chloride (3:2395) or terephthaloyl (di)chloride (3:2205) (81).]
- Oxanilide (oxalic acid dianilide): pl. from C₆H₆ or nitrobenzene m.p. 254° (21) 252-253° (71). [From C̄ + aniline in cold ether or from C̄ + aniline hydrochloride in boilg. C₆H₆ (21); note that by virtue of the relative insolubility of oxanilide and its easy quantitative formn. it is often employed as means for quant. detn. of C̄ cf. (1). Note also that the half reactn. prod. oxanilyl chloride m.p. 82.5° has been mentioned above in main text.]
- —— Oxal-bis-(p-toluidide): m.p. 268° (cf. 1:0445).
- —— Oxal-bis-(α -naphthalide): m.p. 234°.
- Oxal-bis-(β -naphthalide): m.p. 275°.
- **© Oxal-bis-(phenylhydrazide):** cryst. from alc. or AcOH m.p. 278° (82). [From \bar{C} (1 mole) in C_6H_6 with phenylhydrazine (4 moles) in dry ether (82).]
- --- Oxal-bis-(p-nitrophenylhydrazide): unreported.
- —— Oxal-bis-(2,4-dinitrophenylhydrazide); yel. cryst. from alc. m.p. 292° after darkening at about 270°. [Prepd. indirectly.]

 at 767 mm. (1) $D_4^{20} = 1.2231$ (1) $n_D^{20} = 1.38675$ (1) $71.4-72.4^{\circ}$ (2) $71.2-71.5^{\circ}$ at 733 mm. (3) $D_4^{16 \ 9} = 1.2240$ (6) 71.4° cor. (4) $71.0-71.5^{\circ}$ at 750 mm. (7) $71-71.5^{\circ}$ (20) 69° at 720 mm. (5)

[See also ethyl chlorocarbonate (3:7295).]

C is colorless liquid with penetrating odor and strong lachrymatory properties.

[For prepn. of \tilde{C} from carbonyl chloride (phosgene)(3:5000) with MeOH see (8) (9) (7) (4) (10) (20) (21); from methyl formate (1:1000) with Cl₂ see (11) (12) (chloromethyl chloroformate (3:5275) is also formed); from pentachloroethyl chloroformate [Beil. III-13, III₁-(6)] (13) or from bis-(trichloromethyl) oxalate [Beil. III-17] (14) or from methyl trichloromethyl carbonate [Beil. III-17] III₁-(8) III₂-(15)] (15) with MeOH see indic. refs.]

Pyrolysis of \tilde{C} . Unlike the case of ethyl chloroformate (3:7295) the pyrolysis of \tilde{C} appears to have been little studied: in quinoline the decomposition temp. is given (16) (17) as 36°; presumably the decomposition yields MeCl (3:7005) + CO₂.

Reactions of the —COOMe group of \bar{C} . \bar{C} is not readily decomposed by cold aq. (4) (11) (18) and can even be washed to remove alc.; \bar{C} on boilg, with aq. or dil. acid or dil. alk., however, is readily hydrolyzed yielding MeOH (1:6120) + CO_2 + HCl.

[Č with Cl₂ under various conditions (19) (20) (21) (22) (23) yields successively chloromethyl chloroformate (3:5275) dichloromethyl chloroformate (3:5315) and ultimately trichloromethyl chloroformate ("diphosgene") (3:5515).]

[C (10% excess) with MeHSO₄ at 100° under reflux for 6-8 hrs. gives (100% yield (24))

 $Me_2SO_4 + HCl + CO_2$; \bar{C} (10% excess) with ClSO₃H carefully mixed finally refluxed gives (80% yield (25) (26)) methyl chlorosulfonate.]

Reactions of the chlorine atom of C. [C with thallous fluoride 6 hrs. in ice bath followed by reflux at 50° gives (24% yield (27)) methyl fluoroformate b.p. 40° (27).]

 \bar{C} with solid dry NaI gives (100% yield (20)) MeI + CO₂ + NaCl; note that \bar{C} with KI in acetone does not (28) liberate free iodine (dif. from carbonyl chloride (phosgene) (3:5000), chloromethyl chloroformate (3:5275), dichloromethyl chloroformate (3:5315), trichloromethyl chloroformate (diphosgene) (3:5515), or bis-(trichloromethyl) carbonate (triphosgene) (3:1915)).

[Č with solid NaCN (contg. 0.2-7.0% moisture) at not above 90° gives (29) methyl cyanoformate [Beil. II-547, II₁-(238), II₂-(510)], b.p. 97°.]

Č as carbomethoxylating agent. Č is widely employed as a means of introducing the —COOMe group into other organic molecules by reactn. of the chlorine atom with the H of alcoholic, phenolic, or enolic OH group (or their metallic alcoholates, phenolates, enolates, etc.); cf. ethyl chloroformate (3:7295), but this topic cannot be expanded here.

[\bar{C} with dimethyl malonate (1:3457) + Na in xylene (30) or \bar{C} with dimethyl sodio-malonate in C_6H_6 (31) or toluene (32) gives (yields: 59% (32), 40-42% (30) 30-35% (31)) trimethyl methanetricarboxylate (tri(carbomethoxy)methane) [Beil. II₁-(320), II₂-(680)], pr. from MeOH, m.p. 46°. — \bar{C} with dimethyl phenylmalonate + Na in ether gives (40% yield (33)) trimethyl phenylmethanetricarboxylate (phenyl-tri(carbomethoxy)methane), cryst. from least possible hot CHCl₃ by addn. of hot lgr., m.p. 84.5° (33).]

Č also reacts readily with NH₃, with primary and secondary amines, with amino acids, etc., to replace one of the H's attached to N by the —COOMe group (see also below and under **①**).

[\tilde{C} in C_6H_6 with dry NH₃ gives methyl carbamate (urethylan) [Beil. III-21, III₁-(9), III₂-(18)], extremely sol. in aq. (217 g. in 100 g. aq. at 11°), m.p. 54°, b.p. 177°. — \tilde{C} with 33% aq. MeNH₂ (34) or \tilde{C} with equiv. conc. aq. CH₃NH₂.HCl followed by addn. of strong aq. KOH (35) gives methyl N-methylcarbamate [Beil. III-64, III₁-(330), III₂-(567)], oil, sol. aq. but very sol. ether, b.p. 158° at 766 mm. — Countless analogous reactns. cannot be listed here.]

Č in MeOH with hydrazine hydrate in alc. + ether ppts. hydrazine HCl and on evapn. of filtrate gives (98% yield (36)) dimethyl sym.-hydrazinedicarboxylate (sym.-di-(carbomethoxy)hydrazine) [Beil. III₁-(46), III₂-(78)], cryst. from ether/alc., m.p. 132° (36) (note that the half-reactn. prod. viz., methyl hydrazine-monocarboxylate (methyl hydrazinoformate) (methyl carbazinate), m.p. 73°, is also known (37)). — Č (1 mole) with urea (2 moles) refluxed for 2-3 hrs. gives (75% yield (38)) methyl allophanate (N-carbomethoxy) urea [Beil. III-69, III₁-(31), III₂-(55)], spar. sol. hot aq., cryst. from dil. alc. or acetone, m.p. 216°.

 \bar{C} (1 mole) with phenylhydrazine (2 moles) in ether gives (39) methyl ω-phenylcarbazinate (β-carbomethoxyphenylhydrazine) [Beil. XV-286], pr. from aq., m.p. 115–117° (39). — \bar{C} with p-nitrophenylhydrazine in pyridine gives (40) β-carbomethoxy-p-nitrophenylhydrazine, m.p. 180° (40). — \bar{C} with 2,4-dinitrophenylhydrazine in pyridine gives (40) β-carbomethoxy-2,4-dinitrophenylhydrazine, pr. from aq. alc., m.p. 138° (40)

- Methyl N-phenylcarbamate (methyl carbanilate): lfts. from alc., m.p. 47° (41), 46° (42). [From C with aq. aniline (slight excess) (41) (18); also indirectly (42).]
 Methyl N-(p-tolyl)carbamate: unreported.
- N,N'-bis-(Benzyl)urea: ndls. from alc., m.p. 167.5-169° cor. (43). [From Č (1 ml.) with benzylamine (3 ml.) + trace NH₄Cl refluxed 1 hr. (43); note that in this react. the reagent amine not only reacts with the chlorine atom of Č but also ammonolyzes

the carbomethoxy group; the prod. is therefore a disubstituted urea rather than methyl N-benzylcarbamate, ndls. from pet. ether, m.p. 64-65° (44), which has been reported indirectly (44).]

- —— N-(Carbomethoxy)phthalimide: unreported.
- ---- N-(Carbomethoxy)-3-nitrophthalimide: unreported.
- ---- N-(Carbomethoxyl)-tetrachlorophthalimide: unreported. [Note that C with K tetrachlorophthalimide fails to react under reflux and explodes on htg. in s.t. (45).]
- with thiourea (1 mole) in conc. aq. soln. on treatment with NaHCO₃ in slight excess evolves CO₂ and ppts. S-(carbomethoxy)isothiourea bicarbonate, bulky white ppt., m.p. 62.5-63.5°; this ppt. dissolves readily in cold dil. HCl and upon addn. of PkOH ppts. the corresponding picrate; note, however, that the above bicarbonate on stdg. with aq. for 2 days changes spontaneously to N,N-dicarbomethoxythiourea, insol. aq., m.p. 117-118°, and thiourea (extractable with aq.) (46). Note, however, that Č (1 g.) with thiourea (1 g.) in EtOH (10 ml.) refluxed for 30 min., then treated with PkOH (1 g.), does not yield the above prod. but instead (47) S-methylisothiourea picrate, m.p. 224° (47).]

Liquid. — [For f.p./compn. data on mixts. of \bar{C} with 2,2-dichloropropane (3:7140) or with pentachloroethane (3:5880) see (8); for extensive study of vap. press., heat capacity, and other thermodynamic props. see (21); for soly. of aq. in \bar{C} see (22).] [For use of \bar{C} as dry cleaning fluid see (10); for use of \bar{C} in dewaxing of oils see (11).] [For detn. of \bar{C} in air by thermal decompn. method see (23).]

[For prepn. of \bar{C} from 1,1-dichloroethane (ethylidene dichloride) (3:5035) by actn. of Cl_2 see (12) (13) (7); for manufacture of \bar{C} from 1,1-dichloroethylene (vinylidene dichloride) (3:5005) by cat. addn. of HCl see (14) (15).]

C with Ca(OH)₂ at ord. temp. loses HCl yielding (16) 1,1-dichloroethylene (3:5005).

Č with aq. under specified conditions and catalyst hydrolyzes to yield (17) (18) AcOH, AcCl, or Ac₂O.

[For study of actn. of fluorine on C sec (19).]

 $\ddot{\mathbf{C}}$ with phenol + aq. NaOH gives (20) small yield of a mixt. of o-hydroxyacetophenone (1:1746) and p-hydroxyacetophenone (1:1527). [For impt. clarification of previous misapprehension of this reactn. see (20).]

See also Notes 1, 2, and 3.

Note 1. For studies of vap. press. of \bar{C} over range -20° to $+283^{\circ}$ (72) and range +19.2 to 76.4° (73) see indic. refs.

Note 2. For studies of effect on b.p., vap. press., vapor density of very intensive drying see (74) (75) (76) (77) (79) (80).

Note 3. For study of detn. of b.p. range of \bar{C} as method of estimation of impurities see (81).

Note 4. For studies on effect of prior history of sample on detn. of f.p. of \bar{C} see (82) (52) (51).

Note 5. For studies of influence of high press. of f.p. see (41) (83).

Note 6. Solid \bar{C} has a transition point variously determined as follows: -47° (85) cf. (17), -47.55° (33), -47.63° (15), -47.66° (32) (36), -47.84° (39), -48.1° (47), -48.5° (86), -48.54° (87).

Note 7. For studies of density of \overline{C} over ranges -186° to -80° (88), 0° to 283° (crit. temp.) (72), and -18° to $+60^{\circ}$ (89) see indic. refs.

[See also methylene (di)chloride (3:5020) and chloroform (3:5050).]

MISCELLANEOUS PHYSICAL PROPERTIES OF C VARIOUS SOLUBILITY RELATIONS

With water. \bar{C} is only very slightly sol. aq. and is eas. volatile with steam; e.g., 100 g. aq. at 0° dis. 0.097 g. \bar{C} (91), at 10° 0.083 g. (91), at 15° 0.081 g. (8), at 20° 0.080 g. (91), at 30° 0.077 g. (8), 0.085 g. (91); for study of salting-out effect of KCl or MgSO₄ see (92). — For studies of soly. of aq. in \bar{C} at 0° (93), 10° (94), 20° (94), 25° (93), and 30° (93) (94) see indic. refs.; for study of reciprocal soly. of \bar{C} + aq. see (95).

With various inorganic compounds. [For data on soly. in \bar{C} of H_2 (96), O_2 (97) (98), O_3 (99) (100), air (96), N_2 (at high pressure) (101), NO (107), NO_2 (102), N_2O (96), NH_3 (103), H_2S (103), SO_2 (96) (116), HCl (103) (104) (105) (106), HBr (106), Cl_2 (108) (109) (110), or CO_2 (111) (112) see indic. refs. — For data on soly. of I_2 in \bar{C} see (113) (121) (122) (123) (124) (125); for study of nature of I_2 solns. in \bar{C} see (114); for soly. of I_2 in CCl_4 vapor see (115). — For data on soly. of sulfur in \bar{C} see (128) (129) (130). — For data on soly. of $AlCl_3$ in \bar{C} see (135).]

With various organic compounds. [For data on soly. in \bar{C} of ethane (116), ethylene (116) under high press. (101), acetylene (116), dimethyl ether (117), CH₃Cl (117) (118), COCl₂ (119) (120) see indic. refs.]

Binary Systems Containing Č

(See also azeotropes containing C)

 \tilde{C} with various inorganic compounds. $\tilde{C} + Cl_2$: for f.p./compn. data and diag. (note that 5 different cpds. are formed) see (29) cf. (17) (126). $- \tilde{C} + Br_2$: for f.p./compn. data and diag. (eutectic has f.p. about -47.6° and conts. about 82.7 mole % \tilde{C} (38)) see (38) cf. (125). $- \tilde{C} + I_2$: see above under soly. of I_2 in \tilde{C} . $- \tilde{C}$ + I - Cl: for f.p./compn. data and

diag. (series of solid solns.) see (31) cf. (127). — $\bar{C} + SO_2$: for f.p./compn. data and diag. see (131). — $\bar{C} + H_2S$: for f.p./compn. diag. see (132). — $\bar{C} + N_2O_4$: for f.p./compn. data and diag. see (133). — $\bar{C} + PCl_5$: for formn. of compd. 2PCl₅·CCl₄ see (134). — $\bar{C} + PBr_5$: for formn. of 2 cpds. see (134). — $\bar{C} + TiCl_4$: for f.p./compn. data and diag. see (53); for b.p. and liq. vapor compn. see (48).

 \bar{C} with org. cpds. of Order 1. \bar{C} + n-heptane (1:8575): for study of ht. of mixing see (136); for n_D^{20} /compn. see (165). — \bar{C} + C_6H_6 (1:7400): for f.p./compn. data and diag. see (137) (138) (90); for data on D_{20}^{20} (12), D_{23}^{22} (12), D_{25}^{22} (12), D_{25}^{25} (57) (140) (166), and D_{30}^{30} (141) versus compn. see indic. refs.; for $n_D^{1.8}$ (142), n_D^{20} (10), or n_D^{25} (65) (68) (166) versus compn. see indic refs.; for refractive indices at various wave lengths see (67); for data on b.p. at 720 mm. (10), vap. press. (2) (58) (10) (65) (143) (163), heat of mixing (141) (144), liq-vapor equil. (145), or study of distn. through packed column (139) see indic. refs. — \bar{C} + toluene (1:7405): for data on vap. press. (4) (143), D_{20}^{20} (12) cf. (4), D_4^{25} (166), n_D^{18} (146), and n_D^{25} (4) (166) see indic refs. — \bar{C} + cyclohexane (1:8405): for f.p./compn. data (147), D_4^{20} (62), D_4^{25} (140) (58), n_D^{25} (140) see indic. refs.

 $\bar{C} + MeOH$ (1:6120): for D_4^{25} and n_4^{25} /compn. see (151). $-\bar{C} + EtOH$ (1:6130): for vap. press. data/compn. see (148) (149); for D_4^{25} (59) (166) and n_D^{15} (167) or n_D^{25} (166) see indic. refs. $-\bar{C} + n\text{-}PrOH$ (1:6150): for n_D^{25} /compn. see (66). $-\bar{C} + n\text{-}BuOH$ (1:6180): for n_D^{20} /compn. see (165). $-\bar{C} + isoAmOH$ (1:6200): for D_4^{25} and n_4^{25} versus compn. see (166). $-\bar{C} + cyclohexanol$ (1:6415): for f.p./compn. data see (150)

 \bar{C} + dicthyl ether (1:6110): for data on f.p./compn. (152), D_4^{20} (62), D_4^{25} (166), and n_D^{25} (166) see indic. refs. — \bar{C} + disopropyl ether (1:6125): for D_2^{20} /compn. see (62). — \bar{C} + disoane-1,4 (1:6400): for D_4^{20} /compn. see (62). — \bar{C} + anisole (1:7445): for f.p./compn. data and diag see (153). — \bar{C} + diphenyl ether (1:7125): for f.p./compn. data and diag. see (153).

 \bar{C} + acctone (1:5400): for f.p./compn. data and diags. see (90) (147); for D_4^{20} (62), D_4^{25} (59), and n_D^{25} (166) versus compn. see indic refs.

 $\bar{C} + MeOAc$ (1:3005): for D_4^{25} and n_D^{25} versus compn. see (166). — $\bar{C} + EtOAc$ (1:3015): for f.p./compn. data and diag. see (152); for data on vap. press. (65) (192), D_4^{25} (166), n_D^{20} (27), n_D^{25} (166) cf. (65) versus compn. see indic. refs. — $\bar{C} + EtOBz$ (1:3721): for D_4^{20} compn. see (61). — $\bar{C} + diethyl$ carbonate (1:3150): for D_D^{25} /compn. see (5).

 $\tilde{\mathbf{C}}$ with org. cpds. of Order 2. \tilde{C} + nitrobenzene: for f.p./compn. data and diag. (eutectic, f.p. -34.5° , conts. 84.5 wt. % $\tilde{\mathbf{C}}$ (44)) see (44) cf. (138); for D_{-}^{20} , D_{-}^{44} , and n_{D}^{20} versus compn. see (154). — \tilde{C} + aniline: for f.p./compn. data (147) and D_{-}^{25} /compn. (155) see indic. refs. — \tilde{C} + quinoline: for D_{-}^{20} /compn. see (62).

 $ar{C}$ with org. cpds. of Order 3. $ar{C}+CH_2Cl_2$ (3:5020): for data on b.p., D_4^{20} , and liqvapor equilibria see (156). $-ar{C}+CHCl_3$ (3:5050): for f.p./compn. data and diag. (eutectic, f.p. -81.4°, conts. 49.4 wt. % $ar{C}$ (46)) (38) (147) (157) cf. (125) see indic. refs.; for D_4^{20} /compn. see (156) (158) cf. (12); for n_D^{25} compn. see (166); for b.p. and liq.-vapor equil. see (156). $-ar{C}+1$,1-dichloroethane (3:5035): for b.p., D_4^{20} , and liq.-vapor equil. see (156). $-ar{C}+1$,2-dichloroethane (3:5130): for data on b.p. (49) (159), liq.-vapor equil. (49) (159) (160), D_2^{20} /compn. (49) see indic. refs. $-ar{C}+p$ entachloroethane (3:5880): for f.p./compn. data and diag. see (157). $-ar{C}+1$,1,2,2-tetrachloroethylene (3:5460): for f.p./compn. data (45), vap. press. (3) and liq.-vapor equil. (3) see indic. refs. $-ar{C}+2$,2-dichloropropane (3:7140): for f.p./compn. data see (45). $-ar{C}+t$ er-butyl chloride (3:7045): for f.p./compn. data and diags. (complete series of solid solns.) see (47) (161). $-ar{C}+c$ hlorobenzene (3:7903): for D_4^{20} /compn. see (61).

 \tilde{C} with org. cpds. of higher orders. $\tilde{C}+CBr_4$: for extensive study of this system see (162); for D_4^{25} /compn. see (54). — $\tilde{C}+C_2H_5Br$: for D_4^{20} /compn. see (158). — $\tilde{C}+1$,2-dibromoethane: for f.p./compn. data and diag. see (138).

 $\ddot{C}+CHI_3$: for f.p./compn. data see (45). — $\ddot{C}+EtI$: for vap. press., liq.-vapor equil., and $n_0^{25.2}$ see (65).

 \bar{C} + CS_2 : for f.p./compn. data (147), study of distn. (164) (168), D_{20}^{20} /compn. (164), D_{25}^{25} /compn. (12), and n_D^{15} /compn. (168) see indic. refs.

TERNARY SYSTEMS CONTAINING C (See also azeotropes containing C)

 \bar{C} + MeOH (1:6120) + aq.: for studies of phase relations (169) cf. (170) and colloidal character (171) see indic. refs. $-\bar{C}$ + EtOH (1:6130) + aq.: for data on soly. relations incl. density and refractive indices see (173) cf. (170). $-\bar{C}$ + EtOH (1:6130) + C_6H_6 (1:7400): for data on vap. press. see (148). $-\bar{C}$ + EtOH (1:6130) + glycerol (1:6540): for study of soly. relations see (172). $-\bar{C}$ + n-PrOH (1:6150) + aq.: for data and diags. of soly. relations at 20°, and n_D^{25} /compn, see (66) cf. (170). $-\bar{C}$ + AcOH (1:1010) + C_6H_6 (1:7400): for data on density and n_D^{25} see (68); for vap. press. data see (2). $-\bar{C}$ + toluene (1:7405) + 1,2-dibromoethane: for extensive study see (4) (174). $-\bar{C}$ + Cl_2Cl_2 (3:5020) + $CHCl_3$ (3:5050): for f.p./compn. data (ternary cutectic, f.p. -111.4° , conts. 13 wt. % \bar{C} + 60 wt. % CH₂Cl₂ + 27 wt. % CHCl₃) see (46).

BINARY AZEOTROPES CONTAINING C

 $\overline{C} + MeOH$ (1:6120): \overline{C} forms with MeOH a const.-boilg. mixt., b.p. 55.70° at 760 mm., contg. 79.44 wt. % = 44.5 mole % \bar{C} (175), b.p. 54.4° at 734 mm., contg. 77 wt. % \bar{C} (176), b.p. 54.2° at 718 mm., contg. 79 wt. % \bar{C} (176); cf. also (177) (178). $-\bar{C} + EtOH$ (1:6130); C forms with EtOH a const.-boilg mixt, b p. 64.95° (175), 65 08° (179) at 760 mm., contg. 84.15 wt. % = 61.3 mole % (175) \overline{C} ; cf. also (180) (181); for effect of press. on this azeotrope see (182). $-\bar{C} + n\text{-}PrOH$ (1:6150): \bar{C} forms with n-PrOH a const-boilg. mixt., b.p. 72.8° (175), 73.1° (179) at 760 mm., contg. 88.5 wt. % = 75 mole % (175) \overline{C} ; cf. also (183). — \bar{C} + isoPrOH (1:6135): \bar{C} forms with isopropyl alc. a const.-boilg. mixt., b.p. 67.5° (175), 68.95° (184), contg. about 82 wt. % (175) (184) = 64 mole % \bar{C} ; cf. also (183) $-\bar{C}$ + n-BuOH (1:6180): C forms with n-butyl alc. a const.-boilg. mixt., b.p. 76.55° at 760 mm., contg. 97.5 wt. % \bar{C} (179). — $\bar{C} + isoBuOH$ (1:6165): \bar{C} forms with isobutyl alc. a const.boilg. mixt., b.p. 75.8° at 760 mm., contg. 94 5 wt. % = 89 mole % C (175) cf. (183) (186). — \ddot{C} + ter-BuOH (1:6140): \ddot{C} forms with ter-butyl alc. a const.-boilg mixt., b.p. 69 5° (175), 70.5° (185) at 760 mm., contg. 83 wt. % (175), 76 wt. % (185) \overline{C} . \overline{C} + ter-AmOH (1:6160): C forms with dimethyl-ethyl-carbinol a const.-boilg. mixt., b.p. about 76° at 760 mm., contg. about 95 wt. % C (185). — \ddot{C} + allyl alcohol (1:6145): \ddot{C} forms with allyl alc. a const.-boilg. mixt., b.p. 72.5°, contg. 79.5 mole % C (187).

 \bar{C} + acetone (1:5400): \bar{C} forms with acetone a const.-boilg. mixt, b.p. 55.9° at 763 mm. (188), about 56° at 760 mm. (185), contg. about 11.5 wt. % (185) \bar{C} . — \bar{C} + methyl ethyl ketone (1:5405): \bar{C} with methyl ethyl ketone forms a const.-boilg. mixt., b.p. 73.8° at 760 mm., contg. 71 wt. % = 53.4 mole % (175) \bar{C} .

 $\bar{C} + AcOH$ (1:1010): \bar{C} forms with AcOH a const.-boilg. mixt., b.p. about 77° at 760 mm., contg. about 97 wt. % \bar{C} (189).

 \ddot{C} + EtOAc (1:3015): \ddot{C} forms with ethyl acetate a const.-boilg. mixt., b.p. 74.75° at 760 mm. (175) (190), contg. 57 wt. % \ddot{C} (190); b.p. 76.15° at 789.2 mm. contg. 55.6 mole % \ddot{C} (191); b.p. 71.56° at 685.0 mm. contg. 58.2 mole % \ddot{C} (27); b.p. 66.72° at 583.7 mm. contg. 60.75 mole % \ddot{C} (191); b.p. 61.32° at 484.5 mm. contg. 63.75 mole % \ddot{C} (191); b.p. 55.22° at 385.2 mm. contg. 67.75 mole % \ddot{C} (191); b.p. 47.36° at 285.7 mm. contg. 72.6 mole % \ddot{C} (191): for study of thermodynamics of system see (193). — \ddot{C} + methyl propionate (1:3020): \ddot{C} forms with methyl propionate a const.-boilg. mixt., b.p. 75.5° at 760 mm.,

contg. 60 wt. % = 46 mole % (175); b.p. 76° at 760 mm. contg. about 75 wt. % (194) \overline{C} . — \overline{C} + n-Pr formate (1:3030): \overline{C} forms with n-propyl formate a const.-boilg. mixt., b.p. 74.6° at 760 mm., contg. about 69 wt. % \overline{C} (184).

 \bar{C} + nitromethane: \bar{C} forms with nitromethane a const.-boilg. mixt., b.p. 71.3° at 760 mm., contg. about 83 wt. % \bar{C} (184). — \bar{C} + 1,2-dichloroethane (3:5130): \bar{C} forms with ethylene dichloride a const.-boilg. mixt., b.p. 75.30° at 760 mm., contg. about 70 mole % \bar{C} (49) cf. (159); b.p. about 76° at 760 mm. contg. 79 wt. % \bar{C} (185).

TERNARY AZEOTROPES CONTAINING Č

 $\bar{C} + EtOH~(1:6130) + aq.$: this system forms a ternary two-phase const.-boilg. mixt., b.p. 61.8° at 760 mm. (181) (175), contg. 86.3 wt. % = 57.6 mole % $\bar{C} + 10.3$ wt. % = 23.0 mole % EtOH~+ 3.4 wt. % = 19.4 mole % aq.; for use of this azeotrope in detn. of water content of wood see (195). $-\bar{C} + n-PrOH~(1:6150) + aq$: this system forms a ternary two-phase const.-boilg. mixt., b.p. 54 4° at 760 mm , contg. 54 4 mole % $\bar{C} + 18.0$ mole % n-propyl alc. + 27.6 mole % aq. (175). $-\bar{C} + allyl~alc.~(1:6145) + aq.$: this system forms a const.-boilg. mixt., b.p. 65.4° at 760 mm., contg. 90.43 wt. % = 64.5 mole % $\bar{C} + 5.44$ wt. % = 10 4 mole % allyl alc. + 4.13 wt. % = 25.1 mole % aq. (187); b.p. 65.15° at 760 mm. contg. 53 8 mole % $\bar{C} + 18.7$ mole % allyl alc. + 27.5 mole % aq. (175). $-\bar{C} + ter-BuOH~(1:6140) + aq$: this system forms a const.-boilg. mixt., b.p. 64.7° at 768 mm., contg. about 85 wt. % $\bar{C} + 11.9$ wt. % ter-BuOH + 3.1 wt. % aq. (188).

 \ddot{C} + methyl ethyl ketone (1:5405) + aq: this system gives a const.-boilg. mixt., b.p. 65.7° at 760 mm, contg. 76 9 wt. % \ddot{C} + 20.1 wt. % methyl ethyl ketone + 3.0 wt. % aq. (188); for use of this azeotrope in detn. of water in wood see (195).

OTHER SELECTED PHYSICAL CHARACTERISTICS OF C
